Within a well or cistern are suspended two oscillating water-chambers, which have in their bottoms valves opening upward. From an air-reservoir, into which air is compressed by an air-pump, leads a pipe which divides into two pipes that lead to the tops of the water-chambers. The chambers are also provided with air-escape and ascending-water pipes, both of which pass between bars and a rod attached to the oscillating frame that supports the chambers. Both chambers being filled with water, and the compressed air admitted to one, the water in that chamber will be forced up the water-pipes until the weight of the full chamber preponderates, when it descends and the other rises. The chambers thus alternately discharge their contents, and as they swing back and forth their pipes are compressed between the bar and rod of the frame.

Claim.—1. The self-acting oscillating pumping apparatus D E operated by compressed air, substantially in the manner described.

2. The combination of an air-pump, a reservoir for compressed air, and an automatic continuously-acting water-pump, constructed substantially in the manner herein described.

3. The combination of a reservoir of compressed air with an automatic continuously-acting pump and delivery-cocks, by the arrangement of which the action of the pump is controlled, as herein described.

4. A self-acting pumping mechanism, constructed substantially in the manner described, in combination with a delivery-cock, so that its action can be started by opening the delivery-cock and stopped by closing it through the intervention of the inclosed water, substantially as herein specified.

5. The arrangement of the water-chambers with their supply and waste-air pipes in such a manner that the motion of the water-chambers opens and closes the communication through the pipes, substantially in the manner specified.

6. The latch V with its yielding spring X, or its equivalent, to allow a certain force to detach the chamber E, substantially as described.

137,755.—*Hoe.*—HARRY R. BARNES, Rock Stream, N. Y. Application filed September 16, 1872.

The hoe-blade is divided into a series of sections, set or swaged so as to form a concave under surface for all of the divisions. The blade of the hoe is bent at an obtuse angle at the base of the divisions, so as to bring the divisions nearly into a horizontal position when in ordinary use.

Claim.—As a new article of manufacture, the single-bladed hoe, having teeth on its cutting-edge struck up or corrugated, as described, when said teeth are turned or deflected inward from the blade of the hoe so as to stand at an angle thereto, and but slightly inclined from the surface of the soil, and be thereby self-entering at the drawing movement, and when said teeth have their edges made plain and straight from point to base, for the purpose of grinding, as herein shown and described.

137,756.—*Saw-Set.*—JAMES BEGBIE, Philadelphia, Pa. Application filed January 4, 1873.

The support for the edge of the saw is adjustable to teeth of different sizes. An adjustable spur on the support enters between the teeth to regulate their positions, and a gage supports the saw on the side. The dies are interchangeable with others having either more or less of bevel, and a projection from the stock may serve either as a handle or as a stake to fix the device upon the table.

Claim.—1. In combination with an implement for setting saws, the detachable handle, the rod by which the implement may be secured to the work-bench, and the nut, as and for the purposes described.

2. The combination of the setting-stake G upon which a scale is marked, the vertically-adjustable gage A, and the beveled steel plate F attached to the said setting-stake, all operating together as and for the purposes set forth.

3. The setting-stake G, the vertically-adjustable gage A, and the horizontally-adjustable transverse gage *k* provided with a tooth or projection to fit over the points of the saw-teeth, all operating together as and for the purposes described.

4. The pivoted handle B, to which bits of different sizes may be adjusted, the body of the implement provided with a longitudinally-adjustable guide, *i*, and the stake-post G, to which is attached a beveled steel plate, all operating together, as described.

137,757.—*Machine for Threading Nuts.*—ORLANDO P. BRIGGS and LEWIS W. BRIGGS, Chicago, Ill.; said ORLANDO P. BRIGGS assignor to said LEWIS W. BRIGGS. Application filed December 5, 1872.

A series of rotating shafts are carried around, over, and with a series of gripers for holding the taps. On the lower ends of the shafts are the nut-holders, which rotate the nuts upon the taps to cut the threads in the former. The nuts are received from a tilting trough, and they are permitted to leave the tap, when finished, by falling alternately upon two sets of gripers, which retreat alternately from their hold upon the tap.

Claim.—1. The receptacle T^1, arranged to automatically place the nut-blank upon the tap, as described, in combination with disk O and cam-rim F^2, as specified.

2. The combination, with disk O having grooves R and R^1, lugs *r*, *s*, and *t*, of the gripers s^1 s^1 and d^1 f^1, arranged to seize and release the tap, as specified.

3. The series of revolving mandrels N, each provided with the adjustable washer n^1 and disk N^1, adapted to receive and turn the nut-blank, as described.

4. In combination with said mandrels, the primary shafts K and the gear-wheels to rotate said shafts, the levers M and cam M^1 for automatically elevating said mandrels to receive the nut-blank, as specified.

5. In combination with the subject-matter of the third claim, the springs G^2 and arc H^2, for depressing the mandrels upon the nut-blank, as described.

6. In combination with the gripers s^1 s^1 and d^1 f^1, the eccentric shafts A^1 carrying the wheels *n* n^1, for graduating the throw of the gripers, as described.

7. The revolving disk O, carrying the series of thread-cutting taps, in combination with the revolving mandrels and mechanism to rotate the latter, as specified.

8. In combination with the subject-matter of the seventh claim, the tank G, tubes J, primary reciprocating and rotating shafts K, and shaft A^1, as specified.

137,758.—*Sawing-Machine.*—ORLANDO W. BROCK, Etna, Ohio. Application filed March 3, 1873.

A system of levers put in motion and a fly-wheel, which in turn operates the saw.

Claim.—1. The combination of saw-bars C, C', B, and H, connecting-rod E, and balance-wheel F, all operating together, as described.

2. The combination of lever K, rod L, straps N N, cross-bar O, rocking-bar P, post R, connecting-rod S, and gear T, as and for the purposes described.

137,759.—*Hydrodynamic Steam-Engine.*—WILLIAM BURNETT, San Francisco, Cal. Application filed August 24, 1872.

Claim.—1. In a hydrodynamic steam-engine, the method of propelling an inclosed wheel in an inclosing-case by means of a body of water within the case forced circumferentially around it in a continuous rotary current by a jet or jets of steam, substantially as described.

2. In combination with wheel B and case A, the partition C, forming the channel D within the case A for preserving the circumferential direction of the operating-current, constructed and operating substantially as hereinbefore set forth.

3. In combination with case A and steam-chamber E, the rigid plate F' forming the jet-channel, substantially as and for the purpose set forth.

4. The combination of the hood N with the exhaust-pipe G and case A, substantially as and for the purpose set forth.

137,760.—*Tobacco-Plant Cutter.*—JAMES N. CADY, South Hannibal, N. Y. Application filed December 14, 1872.

The blades of the shears are turned upward so that the operator can stand upright, holding the shears nearly parallel to the body while cutting off the stalks of tobacco. The ends of the blade have oblique ends pointing outward, so that a sort of guard is furnished to prevent the cutting-edges from being dulled by catching dirt or gravel between them.

Claim.—The improved instrument for cutting tobacco-plants, having the curved blades A B with oblique ends pointing outward and the upper blade beveled and separated from the lower blade, substantially as and for the purpose herein specified.

137,761.—*Supporter for Men's Drawers.*—ELIAS R. CLEAVELAND, Boston, Mass. Application filed November 23, 1872.

A strip of spring metal is made elliptical in form, and with a hook at one end to which the drawers are attached. On the inside of the lap *b*, and near the other end, teeth are struck which secure it more firmly to the waistband of the pantaloons.

Claim.—The elastic metallic supporter hereinbefore described, consisting of the back-plate *a*, lap *b*, teeth *c*, and hook *d*, all constructed and operating in the manner specified.

137,762.—*Manufacture of Horseshoe-Nails.*—HARLEY D. COWLES, Montreal Canada, assignor to himself and JAMES TERRY, Terryville, Conn. Application filed January 22, 1873.

The strips or double nail-blanks are cut from a rolled plate having thickened edges or margins of which to form the heads, and an intermediate portion reduced in thickness and shape to, or nearly to, what is required in the finished nail.

Claim.—The improvement in the art of making horseshoe-nails herein described, which consists of cutting the plate into strips of double nail-blanks, then staving up the heads thereon, and afterward dividing said double blank by cutting, substantially as set forth.

137,763.—*Scythe-Rifle.*—WILLIAM H. DANIELS, Bryan, Ohio. Application filed February 28, 1873.

Two forms of rifle are attached to a common handle.

Claim.—A compound tool, consisting of a tubular polygonal rifle, A A^1, and a cylindrical rifle, B B^1 *b*, substantially as shown and set forth.

137,764.—*Land-Pulverizer.*—THOMAS R. DENBY, Carlinville, Ill. Application filed February 3, 1873.

A land-pulverizer consisting of two revolving harrows pivoted in an independent and adjustable frame; the frame is then pivoted in side bars. The front part of this frame is faced with iron for use as a leveler. In the rear of the harrows are secured two land-rollers of the usual form.

Claim.—The arrangement of the oscillating iron-faced leveler-frame A', the harrow-cylinders D D, the lever I, bars H H, and rollers B B, as and for the purposes herein set forth.

137,765.—*Hydraulic Jack.*—RICHARD DUDGEON, New York, N. Y. Application filed February 12, 1873.

The cavity in the lower end of the pump-head is made of larger internal diameter than the pump-plunger, so that when the latter is depressed sufficiently to open the egress-valve the lower end of the side passages in the pump-plunger communicates with the upper part of the enlarged cavity, allowing the liquid to pass in a backward direction around the plunger-packing into side passages to the reservoir.

Claim.—1. The combination and arrangement of the pump-plunger, constructed with longitudinal passages, the pump-barrel, and the reverse-passage, substantially as before set forth.

2. The combination and arrangement of the pump-plunger, the pump-barrel with its reverse-passage, the egress-valve, and the guard thereof, substantially as before set forth.

137,766.—*Manufacture of Sweet Biscuits.*—HENRY EVEN, Pekin, Ill. Application filed March 3, 1873.

Flour, water, eggs, and yeast are mixed into a sponge and allowed to rise, after which there is added butter, sugar, and salt, and the whole mixed together and again allowed to rise. The dough is then made into biscuit, which, when light, are baked. When these are cool they are split and thoroughly dried.

Claim.—The dried sweet bread or biscuit, composed of the ingredients in the proportions named, and treated in the manner substantially as described.

137,767.—*Saw-Swage.*—WILLIAM FERGUSON, Canton, Ohio, assignor to himself, THOMAS A. LATHROP, and THOMAS H. REEVES, same place. Application filed March 21, 1873.

A rectangular die-block, with dies on two or more of its sides, fitted in a slot in the end of the stock and held in place by shoulders in the slot and by an external band.

Claim.—The combination of a swage-stock having a recess in it, and shoulders *c* therein, the clamping ring or band, and a removable and reversible die-block with dies therein, as and for the purpose described and represented.

137,768.—*Cart-Loading Apparatus.*—BENJAMIN G. FITZHUGH, Frederick, Md. Application filed September 7, 1872.

The loaded cart is automatically released as the full car reaches the top of the incline, and the dumping is then effected by the continued revolution of a shaft, effected by means of a crank-handle, bringing the curved ends of the car under the shaft and its wheels against the stops; in this position the operating-ropes, being inclined from the shaft to the rear of the car, readily tip it.

Claim.—1. In a cart-loading apparatus in which the loading cars are arranged and operated alternately upon inclined railway tracks, a loaded cart connected, as described, to the operating mechanism, to raise and lower at the same time the loaded and empty car by the motion of the horse away from the loader.

2. In a cart-loading apparatus, the combination and arrangement of double railway tracks with their separate cars, winding and unwinding shaft C, and winding and unwinding pulleys M M', when the latter are arranged to be operated by a single connecting-shaft, and by the movement of a loaded cart, essentially as described.

3. The detaching device of the cart, in combination with a long and short rope, *a a'* *b b'*, of the winding and unwinding shaft C of the loader, essentially as and for the purpose described.

4. In a cart-loading apparatus, the combination and arrangement of the hinged adjustable sections E of the railway tracks with the fixed sections D and the bracing-chains G, essentially as and for the purpose herein described.

5. The detent S of the fixed section D of the frame, in combination with a rack, U, on the car, to automatically lock and hold the car after being brought to a position to be dumped by hand, essentially as described.

6. The combination of the curved stop *f* at the forward terminus of the rails with the pins or catches *g* of the car, automatically interlocking to hold the car in position while in the act of dumping, essentially as described.

7. In combination with the railways and the cars elevated thereon, as described, by the pulley-ropes, the crank-shaft connected by sprocket-wheels and belt with the operating-shaft for dumping the loaded car by hand and leaving it in position to descend by its weight, as described.

8. In combination with a railway track and a dumping-car, operated as described, the arrangement of the operating-shaft C to form a stop for the car, and hold it to the track while dumping, substantially as described.

9. The ropes L^2 of the operating-shaft C, connected with the car at the top thereof, and in the rear of the truck-wheels L, to operate in connection with the shaft C to dump the car when arrested, as described.

10. The two separate hand-operating loading-machines, constructed as described, united together to form a double loading-machine, by means of the disks *n* on the operating-shafts, as described.

11. The cart-loading apparatus, having its several parts constructed and arranged for joint operation, substantially as herein set forth and shown in the drawing.

137,769.—*Machine for Turning Carriage-Axles.*—HAMLET E. FORREST, Boston, Mass., assignor to himself, HORATIO BOOTHBY, same place, and JOHN H. LEAVITT, Portland, Me. Application filed February 25, 1873.

A lathe with a transversely-reciprocating slide, on which are three cutters, placed obliquely to impart a shear-cut, and of the shape and size required to turn, without lateral movement of the slide, the journal, re-enforce, and shoulder or collar.

Claim.—As a mechanism for finishing axle-blanks, the combination of two or more cutters, C C^1 C^2, formed and arranged as described, and to operate in manner and for the purpose set forth.

137,770.—*Door and Gate Spring.*—JOHN T. FOSTER, Jersey City, N. J. Application filed February 27, 1873.

The plug which holds the end of the spring is furnished with a large screw-thread, which takes upon the coil of wire composing the spring proper. Through the square shoulder of the plug, above the screw-threads, are bored two holes at right angles to each other. Upon a plate attached to the gate-frame is a fixed pin, and this serves to adjust the spring by passing through the holes in the square part of the plug after the requisite torsion has been given it.

Claim.—1. For use in a door and gate spring, a plug provided with screw-threads so as to fasten the ends of a coiled spring to the plug by screwing them thereon, substantially as set forth.

2. In combination with the elements above, a fixed pin for adjusting the plug by means of holes through the same, substantially as and for the purpose set forth.

137,771.—*Corn-Husking Thimble.*—GEORGE W. GASH and CHARLES L. OWENS, Clinton, Ill. Application filed October 21, 1871.

The bead or flange on the lower edge of the thimble serves to keep it in place in the tips of the fingers and thumb of a glove, and the blade for cutting and loosening the husks on the corn.

Claim.—As an article of manufacture, a husking-thimble provided with a blade for cutting the husks on the corn and an outward bead or flange around its lower edge, for the purpose set forth.

137,772.—*Awning.*—GEORGE W. GERAU, Brooklyn, N. Y. Application filed September 7, 1872.

The awning is so arranged that, by means of an outer side wing held open by a brace and an inner side wing fastened back, the air blowing from the side will be directed into the room.

Claim.—1. The brace D, combined with the side wing *b* of an awning, substantially as set forth.

2. The awning provided with the inner wing or wings E and with the opening side wings *b b*, substantially as herein shown and described.

137,773.—*Machine for Winding Wads.*—ALFRED CHARLES HOBBS, Bridgeport, Conn. Application filed November 30, 1872.

A strip of paper is wound upon a mandrel under pressure of a compressing-roll hung in the end of a lever, which, vibrating as the wad increases to a given size, trips a lever which separates the friction-disks of the driving-shaft and applies a brake to stop the machine.

Claim.—1. A wad-winding machine, operating substantially as herein described, so that it automatically stops as soon as the wad attains the required size, as specified.

2. The roller G on a sliding bar, E, operating by means of the vibrating arm *p*, sliding bar H, and tappet *r*, or their equivalents, in connection with the lever D, mandrel B, substantially as herein specified.

3. The combination of the spindle B and its friction-disk *c*, the driving-shaft C and its friction-disk *d*, and the lever D and its projection *f*, the vibrating lever *p* and its accessories, substantially as and for the purpose herein specified.

4. The wad-stripping sleeve *w*, in combination with the spindle B, substantially as herein specified.

137,774.—*Broom-Protector.*—GEORGE HUNT, New York. N. Y. Application filed March 15, 1873.

A broom constructed in ordinary form, with corrugated strips passing from the top to near the center of the broom and the binding-wire fitted to the corrugations, and a binding-strip attached to it by braces which adjust it to the broom and for moving it up or down for its support.

Claim.—The broom-protector herein described, composed of the belt E, straps F F, wire-fastening H, and wire braces L, when used in combination with the broom A, constructed and operating for the purpose set forth.

137,775.—*Safety-Paper for Bank-Notes, &c.*—JOHN JAMESON, Gateshead, England, assignor to HIRAM A. TUCKER, New York, N. Y. Application filed August 19, 1870.

A design printed so that by the use of chemical inks the design shall either be changed in color or obliterated, or, being invisible, or nearly so, shall be rendered visible at the parts written upon.

Claim.—A safety-paper provided with a design or designs produced by the process and in the manner substantially as described, whereby the character of the ink employed is indicated by the discharge, change, or development of color of the same, substantially as and for the purposes set forth.

137,776.—*Gang-Plank.*—FRANK G. JOHNSON, Brooklyn, N. Y. Application filed August 28, 1872.

Combination of levers, having casters or rollers in one extremity, with a gang-plank having eyebolts for guides for the operating-rope, whereby the weight of the plank is thrown upon the rollers upon pulling the rope in either direction, and the plank thereby conveniently and easily moved as required.

Claim.—The combination of the levers C C and hauling-ropes F F and E E with the gang-plank A, substantially in the manner and for the purpose set forth.

137,777.—*Self-Acting Spinning-Jack.*—JOSEPH E. KNIGHT, Hyde Park, Mass. Application filed March 6, 1873.

The arm of the "Brothers" jack, which is operated by an arm on the carriage to disengage the running-out mechanism, is made in two parts, one adjustable on the other, to enable the time of such operation to be varied, said adjustable part carrying the pin which is engaged by the catch which holds the carriage in position at the end of its outward run, and said catch being arranged on the carriage-arm, which operates the disengaging-arm first above referred to.

Claim.—In a jack the extension arm A, composed of the two parts *a b* provided with the stud *c*, and constructed, arranged, and connected as described, in combination with the carriage-arm B provided with the lever-catch A, arranged upon it as set forth, all being disposed and to operate together, substantially as specified.

137,778.—*Weight-Hook for Knitting-Machines.*—CHARLES H. KOSKEL, Buffalo, N. Y. Application filed December 26, 1872.

By moving the regulator up or down the hooks may be contracted or expanded, and thus adapted to be applied to varying widths of work being knit.

Claim.—The combination of the thimble B, hook A, elastic hooks C, and regulator D, substantially as and for the purposes set forth.

137,779.—*Dining-Table.*—ABEL LAND, Hillsdale, Mich. Application filed April 7, 1873.

The table is made so as to form a straight table or curved, by means of the extension bars and angular detachable leaves. The legs and other parts can be detached and all packed within a small compass.

Claim.—1. The construction and combination of parts herein described, whereby a convertible, straight, and curved extension-table is produced, as specified.

2. In an extension-table, the hinged pieces D having beveled ends, as described, in combination with the cord *s* and windlass *i*, when arranged and operated as herein set forth.

3. The combination, in an extension-table, of removable and adjustable legs, the detachable cross-pieces C' C', and the permanent parts A A, constructed as described, whereby the parts may be packed in the smallest compass, as and for the purposes set forth.

137,780.—*Skate.*—JOHN T. LARKIN, Halifax, Nova Scotia. Application filed November 8, 1872.

The heel-plate is secured by the rear end being bent down and riveted to the runner, and by the pivot which holds it together with the sliding foot-plate and lever. A plate, having flanged edges, holds the foot-plates together in place, and has upon its rear face a curved line of teeth to fasten into the boot-heel.

Claim.—1. The heel-plate C, secured both by the pivot-post C^1 and the rear lip C^2, and arranged over the lever H and slide F, so as to serve, relatively to the boot-heel and to the other parts of the skate, as herein specified.

2. The longitudinal inverted trough-piece G *g*, arranged relatively to the plates E and F and set-screw and nut M M', and provided with teeth adapted to act against the front face of the boot-heel, as specified.

137,781.—*Boot.*—GEORGE S. LEE, Worcester, Mass., assignor to himself and PEABODY WEST, same place. Application filed February 18, 1873.

The edges below the transverse cuts are turned out, sewed from the outside, and covered with a saddle-piece. Above these cuts the edges are lapped and sewed.

Claim.—An improved boot, the side seams of which are formed as described—that is to say, with the lower turned-out edges *a b* covered by braces or saddles D, and the upper lapped edges *e f*, substantially as shown and set forth.

137,782.—*Cultivator.*—AUGUSTUS LEONARD, Newell's Run, Ohio. Application filed August 30, 1872.

The side beams are rigidly attached in front to the central beam, depending upon their elasticity for the lateral movement in rear to adjust them to a greater or less width. This movement is controlled by the handles pivoted to bars sliding through a mortise in the central beam and held in any desired position by a retaining-pin.

Claim.—1. The combination of the central beam, the side beams, the sliding bars, and the pivoted handles, the handles being connected to the sliding bars at their front ends, substantially as described.

2. The machine described, consisting of the central beam A and the side beams B, united thereto as described, the handles C C, standards *c c*, tie-bars *c'*, sliding bars D D, with holes, as described, and the securing-pin in the central beam, as set forth.

137,783.—*Piston-Rod Packing.*—THOMAS LORD, Providence, R. I., assignor to himself, JOSEPH KELLY, and HENRY J. PAINE, same place. Application filed January 20, 1873.

A stuffing-box having a hinged joint to allow the vibration or irregularity of the piston-rod; the box made of three sections and a double conical hollow plug with a lead socket rounded out on the inside for the purpose of allowing lateral motion to the entire packing and preventing the leakage of steam.

Claim.—1. The combination, with the part A, of the socket piece C, conical packing-cup D, plate E, and packing-piston K, substantially as and for the purpose set forth.

2. The hinged bolts F, in combination with the body of the stuffing-box, and the packing piston or gland, substantially as and for the purposes set forth.

137,784.—*Bottom for Sofas, &c.*—ISAAC MASON, Brooklyn, N. Y. Application filed February 27, 1873.

Strips of webbing stretch across the frame of the bottom at right angles to each other, and narrower strips of rolled iron are secured under each strip of webbing.

Claim.—The combination and arrangement of the fibrous strips B and metal supporting-strips C, arranged relatively to each other and to the frame A, and adapted to yield their united support to the superincumbent material, in the manner herein specified.

137,785.—*Automatic Fan.*—HAMILTON T. MCCORMICK, Selma, Ala. Application filed September 24, 1872.

The fan-hanging apparatus is made instantly adjustable to shorten the stroke and increase the speed.

Claim.—In an automatic fan the combination of the operating motor with the elbow-lever B, pendent arms D, lifting-frame N, cross-bar E, lever I, and ratchet-bar H, constructed and arranged to actuate a fan, substantially as specified.

137,786.—*Hook Attachment to Bands of Fire-Arms.*—IRA MERRILL, Springfield, Mass. Application filed December 24, 1872.

Guns may be readily hooked together for stacking.

Claim.—The combination of the hook C with a ring or swivel attached to the gun, substantially as and for the purpose herein set forth.

137,787.—*Fruit-Press.*—OLIVER METCALF, Mitchell, assignor to JOSEPH HARLAN, Lexington, Ind. Application filed December 20, 1872.

An interior perforated cylinder is located in the center of the crushed mass, and an interior exit is allowed for the juice.

Claim.—1. The inner perforated tube D, provided with a projection, *a*, at its lower extremity, for leading off the expressed juice to a proper receptacle, substantially as shown and described.

2. The device for attaching the piston F to the rod G, consisting of a detachable branch, P, and the hooked form of both branches at their lower extremities, substantially as shown.

3. In combination with the elements of the above-described press, the slotted base A, constructed substantially as shown, and for the purposes set forth.

137,788.—*Sink-Drain.*—GEORGE R. MOORE, Philadelphia, Pa. Application filed January 24, 1873.

The sink is made with a depression for sediment to settle in, and in this is arranged the stench-trap, and a splash-check hung to swing easily, so that it may be closed by a rapid current through the passage from the strainer and prevent choking up of the pipes. The outlet-pipe is provided with a valve operated by a handle extending through the floor of the sink.

Claim.—1. The splash-check or automatic valve H, substantially as and for the purpose herein set forth.

2. The clamp or coupling E, for the purpose herein set forth.

3. The arrangement of the valve G lower down than the strainer A and in immediate connection with the drain-pipe C, and operated through an opening in the cover M, all substantially as and for the purpose herein set forth.

4. In combination with the depression B, the strainer J with its solid upper part, whether made in one piece or not, as a device to operate in conjunction with I or its equivalent in performing the functions of trapping and of keeping back grease, as herein set forth.

5. The arrangement and combination of the several parts A B C K, as herein shown.

137,789.—*Elevator.*—WILLIAM A. MORRISON, Cambridge, Mass. Application filed March 6, 1873.

The shafts have eccentrics at their ends to press against tongues of guides when the cross-head, to which, at their other ends, they are attached by cranks, becomes depressed through the breaking of hoisting-rope, (fastened to lever L and connected by rod to the cross-head,) and thus arrest the descent of the elevator. The balance-weight aids in stopping elevator by further depressing the cross-head (with which it is connected by lever I) in case of breakage of hoisting-rope.

Claim.—The eccentrics E, the shafts D, cranks F, and cross-head G, arranged together and applied to the lifter-rope, or its rod, of the elevator, and to the vertical tongues of the guides, substantially in manner and to operate as set forth, in combination with the lever I, balance-weight W, and line K, arranged and combined, as set forth, with the elevator lifting rope or chain or rod H thereof, all being as, and to operate essentially as, specified.

137,790.—*Photographic Sky-Light.*—CHARLES D. MOSHER, Cook county, Ill. Application filed March 9, 1872.

An adjustable sky-light for photographic galleries, arranged so that the angle of inclination can be varied irrespective of the pitch of the roof. It is managed by a windlass and blocks, and has folding sides to exclude the weather.

Claim.—1. The adjustable sky-light A, in combination with roof B, when so arranged that the upper end of said sky-light may be raised above or be depressed below the line of junction with said roof, in manner set forth.

2. The combination of upright frame C, placed upon roof B, with sky-light A, for the purpose indicated.

3. The combination of cable D, adjustable sky-light A, and upright frame C, substantially as described.

4. The windlass E and cable D, in connection with short cables *d d* and blocks and cable-fastenings *a a* and *b b*, for the purpose and as herein set forth.

5. The adjustable folding sides G G, when used for the purpose and in the manner described.

6. The bars *f f*, forming stiffening-frame for and used in combination with folding sides G G, as set forth.

137,791.—*Egg-Carrier.*—EDWARD L. MUELLER, St. Louis, Mo. Application filed February 12, 1873.

One end of the strip forming the side walls of the egg-pockets is bent at right angles consecutively to form not only the four walls but a connecting-piece, by which each series of pockets may be secured to the corresponding side strip.

Claim.—An egg-carrier formed of a series of strips having one portion of each bent at right angles and folded, as shown and described, in connection with diaphragm c^1, for separating one series from another.

137,792.—*Machine for Bending Tube-Sockets.*—WILLIAM L. NEWSHAM, Philadelphia, Pa., assignor to MORRIS, TASKER & CO., same place. Application filed December 31, 1872.

To the plunger is pivoted the mandrel, which is forced down by the former upon the metal to bend it in the center to trough shape. Two side-benders, one on each side, descend in different times and bend the skelp around the mandrel, the edges lapping each other. The plunger in rising brings the mandrel to an inclined position, which permits the socket to slide therefrom.

Claim.—1. The combination of the articulated mandrel D, die C, and slide E, operated by means of the cam H, or other suitable mechanism, in such a manner that by the downward movement of the slide the skelp is pressed by the mandrel into the die, and bends the middle part of the skelp, and in the upward movement of the same, after the completion of the bending process by the other dies, the mandrel is tilted to discharge the socket from the mandrel, substantially as described.

2. The combination of two movable dies, C^1 and C^2, for bending the outer portions of the skelp, in combination with the die C and mandrel D, either movable or stationary, the said dies moving one a little in advance of the other and in different planes with each other, and at angles with and above the horizontal plane of the lower die C, substantially in the manner set forth.

137,793.—*Windmill.*—WILLIAM D. NICHOLS, Batavia, Ill. Application filed October 3, 1872.

A transverse shaft near the pivot and at right angles to the axis of the wind-wheel, carrying at each end a blade or vane, these blades being of unequal width and radiating from the shaft at different inclinations. The mill is operated tail to the wind, the vane for holding the wheel in the wind being dispensed with, and the wheel kept in the wind by its own surface. The transverse shaft above mentioned is weighted so as to keep the blades in a position to exhibit equal vertical surface to the wind and thus balancing each other. When the wind blows strong enough to raise the weight the lesser blade goes out of the wind and the larger blade comes into the wind, and, offering a broad surface, turns the mill upon the pivot and brings the wind-wheel more or less out of the wind.

Claim.—1. The wind-wheel C, in combination with the transverse weighted shaft E carrying the vanes F F', constructed and operating substantially as specified and shown.

2. The combination of the shaft E, vanes F F', bell-crank *e*, hollow pump-rod H, rod *f*, lever K with universal joint J and weight G, substantially as and for the purpose specified.

137,794.—*Horseshoe Attachment.*—PATRICK H. O'NEILL, St. Louis, Mo. Application filed December 19, 1872.

Claim.—1. A heel-strap with upper and lower padding, as and for the purpose set forth.

2. The toe-strap formed with branch side straps, as and for the purpose set forth.

3. An improved horseshoe attachment, consisting of toe-strap B, branch-straps b^1 b^1, ankle-strap C, loop b^4, and double-padded heel-strap D, as herein shown and described, as and for the purpose set forth.

137,795.—*Rotary Steam-Engine.*—LA FAYETTE PARKER, Davenport, Iowa. Application filed January 20, 1872.

Two parallel steam-chambers, with revolving pistons, are combined with sliding abutments and a valve, which are actuated by pivoted levers and a cam on the shaft. The pistons are provided with packing-pieces on all four sides set out by springs.

Claim.—1. The arrangement of two parallel steam-chambers, *b b*, in a combined cylinder, *a a*, with cut-offs *f g* and pistons *e d*, attached on opposite sides radially to shaft *c* by hubs 10 10 in each steam-chamber, constructed and operated substantially as shown and described.

2. The arrangement of hub 10, shaft *c*, cylinder *a a*, and pistons *e d*, constructed substantially as shown.

3. The arrangement of cam *l*, rock-lever 12 and *m*, rod *r* to operate cut-off *f*, substantially as shown.

4. The arrangement of cut-off *g* in steam-passage 2 with piston *e*, to operate substantially as shown.

5. The arrangement of packing-bars *t* and spring *t'* with pistons *e* and *d*, substantially as shown and described.

137,796.—*Steam Pump and Condenser.*—ELI REESE, Mahanoy City, Pa. Application filed February 5, 1873.

The exhaust-steam from the engine is condensed in a vessel partly from the column of water in the discharge-pipes and partly with water from the suction-pipes, giving the pump the benefit of the water so lifted by the vacuum formed in the vessel or condenser, and assisting the pressure in the steam-cylinder by the vacuum on the opposite side of the piston.

Claim.—The condenser A, exhaust-steam inlet B, spray-discharge pipe C, blow-pipe G, suction pipe D, and pump connecting-pipes E E, all constructed and arranged for operation as and for the purpose specified.

137,797.—*Music-Leaf Turner.*—ANTHONY ROSENFIELD, San Francisco, Cal., assignor to himself and HENRY POLLEY, same place. Application filed August 17, 1872.

The series of disks carrying the turning-arms is provided with a slot, in which works the retaining and freeing rod.

Claim.—The uprights B B of the frame provided with slots C C, in combination with the lower sliding pin D with beat-end, and upper sliding pin D', as and for the purpose set forth.

137,798.—*Loom Picking Mechanism.*—LESTER E. ROSS, Providence, R. I. Application filed November 5, 1872.

The picking-stick is placed upon a rocker and is put in position by a cam which operates a lever having a loose connection with the toe of the rocker. The stick is actuated in the picking movement by two coiled springs attached at one end to the frame below and at the other end to the rocker, one on each side, at or near the toe; or the springs are attached to a rocking bar on the frame.

Claim.—1. The combination of the rocker *j* and its supporting-beam with the lever *i* and cam A and actuating-springs, all constructed and arranged as described.

2. The combination of the rocker *j*, the actuating-springs *l*, and the rocking bar *m*, as described.

137,799.—*Lasts for Boots and Shoes.*—WILLIAM H. ROUNDS, Campello, Mass. Application filed February 24, 1873.

Nails having shoulders or flanges and of the same size above side flanges are permanently secured to the face of the last. The sole of the shoe is attached by a blow of the hammer over each of the nails.

Claim.—A last having its bottom provided with projecting pins *b*, constructed of the same size, above the flange *c*, and over which the inner sole is to be forced or driven, substantially as and for the purpose set forth.

137,800.—*Hot-Air Furnace.*—BENJAMIN C. SAYRE, Montrose, Pa. Application filed February 15, 1873.

Both the outer casing and the cylinder above the fire-pot have double walls. The products of combustion pass between the two walls of the combustion-chamber. The combustion-chamber and the upper portion of the casing may be turned about, the lower portion of the furnace remaining stationary.

Claim.—1. The double-wall casing, composed of two horizontal sections, D E, connected by a perforated ring, *g*, and combined with a fire-pot, B, and a flue-drum, G, the section E and drum G being adjustable, substantially as described.

2. The drum G, mounted on the fire-pot B, and composed of double walls with a flue-space, *i*, between them, the inner wall communicating through the orifice *k* with the combustion-chamber, and the outer wall communicating with the escape-flue *i'*, in combination with an external casing, D E, substantially as described.

137,801.—*Binding-Screw.*—FRANK SHURZ, Paloma, Ill. Application filed December 11, 1872.

The head of the screw is provided with ratchet-teeth, in which a spring-pawl fastened to the post catches and prevents the screw from turning back.

Claim.—The thumb-screw A provided with ratchet-teeth and a spring-pawl, substantially as shown and described.

137,802.—*Garden-Hose Holder.*—HENRY C. SMITH, Cleveland, Ohio. Application filed August 7, 1872.

To the upper end of a rod is pivoted a semicircle having a flange and an ear with a lip and set-screw for clamping a hose-pipe. The semicircle has a slot with a set-screw through it entering the rod, by means of which the hose-pipe may be fixed at any desired angle. By means of slides and a set-screw the rod is connected with another rod, and may be elevated or lowered, as desired.

Claim.—The rod A, foot-piece B, rod C, slides D D, semicircle E with slot I and set-screw J, flange F, and lip and set-screw G, all constructed, combined, and arranged substantially as shown and described, for holding a garden-hose pipe, H, as and for the purpose set forth.

137,803.—*Meat or Fruit Press.*—LA ROY S. STARRETT, Athol Depot, Mass., assignor to ATHOL MACHINE COMPANY, same place. Application filed December 16, 1872.

The screw and the bridge or yoke through which it passes can be removed without disturbing the follower, and the follower itself be separately lifted out of the receptacle, which is conveniently accomplished by grasping a knob, suitably fastened to the follower.

Claim.—The bottom A A^1, having the upright cheeks A^2, in combination with bridge C, screw D, handle D', follower E, and receptacle B, constructed and arranged substantially as and for the purpose specified.

137,804.—*Combined Rave and Fender for Sleighs.*—SAMUEL M. STEWART, Rochester, N. Y. Application filed December 20, 1872.

Claim.—As a new article of manufacture, a combined rave and fender for the runners of sleighs, made as herein described—that is, of a single piece of wood, steam-bent, with its front end *a* curved to form a rest for the runner, as specified.

137,805.—*Broom-Corn Duster.*—JAMES L. STRANAHAN, Chicago, Ill. Application filed March 7, 1873.

A brush-broom constructed in ordinary form, with a connecting stick in its center, to which the corn is attached, over which is fitted the handle by an enlarged opening in its lower end.

Claim.—The combination of the brush A, stick B, and socket-handle C, arranged as described, for the purpose set forth.

137,806.—*Man-Hole Lid for Boilers.*—ROBERT TIFFETT, Harrisburg, Pa. Application filed January 17, 1873.

The lower lid is rabbeted to hold a hollowed plate, which supplies the place of the ordinary flange, the whole secured to the boiler by means of a yoke, bolt, and nut.

Claim.—1. The detachable rabbet-plate A, or its equivalent, in combination with the man-hole lid B, the parts being applied substantially as and for the purpose herein set forth.

2. The combination of the yoke N K, the lid B, rabbet-plate A, handles S, and bolt W, all constructed and arranged to operate substantially as and for the purpose herein set forth.

137,807.—*Collar Button or Stud.*—JAMES I. WADDELL, Annapolis, Md. Application filed February 8, 1873.

Claim.—A neck-tie fastener, composed of a stud or button grooved or dovetailed transversely of its outer disk and a wedge-shaped piece, *b*, having a spring, *c*, attached thereto, constructed and arranged substantially as and for the purpose set forth.

137,808.—*Automatic Signal for Railroad Crossings.*—RICHARD WALKER, Milford, Mass. Application filed August 30, 1872.

The signal-bar, standing normally in a vertical position, is connected, by levers and rods, with a tripping-lever near the railroad track at a suitable distance from the crossing road, so as to be operated by an approaching train and thrown into a horizontal position across said road, in which position it is held by a locking slide-bar. As the train passes the crossing road another tripping-lever throws the signal-bar back to its vertical position.

Claim.—The combination of the lever *e*, rod *u*, bar *r*, springs *s*, arms *q y l*, spring *o*, lever *k*, chain *h*, pulley *b*, lever *x*, and signal *c*, all arranged and operating substantially as described.

137,809.—*Thrashing-Machine.*—ANDREW WEMPLE, Chicago, Ill. Application filed June 15, 1872.

Improvement on 126,117. Conical thrashing-plate with projecting teeth, revolving horizontally in a concave hood, through which grain is fed. Straw carried up by an inwardly-inclined belt and delivered to an off-beating belt, arrangement of fans, and sieves, as claimed.

Claim.—1. The combination of the thrashing-plates D and G and fan-rods Y with the feed-table or opening E and tables F, substantially as specified.

2. The combination of the fan H with a separating-chamber and the thrashing-plates D and G and their case, substantially as and for the purposes specified.

3. The carrier O, in combination with a separator, substantially as and for the purpose specified.

4. The combination of the sieve K, inclined carrier O, and carrier Q, substantially as described.

5. The combination of the rods M and L, sieve K, and wind-board I with the carriers O and Q in a separator, constructed substantially as specified.

6. The back board P, when located and operating substantially as and for the purpose specified.

7. The blast-fan H, in combination with the separator Z', constructed and operating substantially as specified.

137,810.—*Connecting-Post for Electrical Apparatus.*—THOMAS WISHART, Clayton, Del., assignor of one-half his right to SOLOMON J. GANMAN, same place. Application filed March 3, 1873.

Center plug sliding in hollow post, combined with spring, substituted for screw-post.

Claim.—The connecting-post for electrical instruments, formed by the combination of a chambered post, an interior plug, and a spring, substantially as described.

137,811.—*Gas-Retort Furnace.*—WILLIAM C. WREN, Brooklyn, N. Y. Application filed April 3, 1873.

The parts of the furnace are so made that they can be put together and taken apart at pleasure; and the fire-pot with the flues and the arch are combined in such a manner as to give the greatest heat with the smallest consumption of fuel.

Claim.—1. The bottom, side, end, and top plates J B C F D G H, for the purpose as described.

2. The combination of the flues *e e e* with the fire-pot and oven, together with the outside frame, in the manner and for the purpose as described.

137,812.—*Harvester.*—GEORGE W. N. YOST, Corry, Pa., assignor to "ACME MOWER AND REAPER COMPANY," New York, N. Y: Case A. Application filed September 16, 1872.

The removable sleeve containing the bearings of the crank-shaft is kept from moving endwise by wheels on the shaft, and its rotation prevented by a rib thereon engaging with a groove in the frame.

Claim.—The arrangement of a detachable bush-holding journal-bearing sleeve within the main frame of a mowing or reaping machine, when held therein by gear-wheels on the axle within such sleeve, and prevented from revolving by a spur, substantially as described.

137,813.—*Harvester.*—GEORGE W. N. YOST, Corry, Pa., assignor to "ACME MOWER AND REAPER COMPANY," New York, N. Y. Application filed September 23, 1872.

The coupling-arm is hinged to the neck of the main frame by means of a loop fitting in a circumferential groove thereon, and the joint is strengthened by slipping over it a slotted sleeve, which also forms a shield for the crank-wheel.

Claim.—The combination of a tubular metal crank-wheel shield with the loop of a connecting-bar over the end of the main frame of a mowing or reaping machine, substantially as described.

137,814.—*Harvester.*—GEORGE W. N. YOST, Corry, Pa., assignor to "ACME MOWER AND REAPER COMPANY," New York, N. Y. Application filed September 23, 1872.

The coupling-arm and brace-bar are hinged to the main frame upon axes at right angles to each other, and united by a combined screw-joint and flexible connection, whereby free movement on the hinges is permitted.

Claim.—The arrangement of the screw-socket joint with the elastic joint at the junction of and between the connecting-bar hinged to the main frame on a journal at a right angle to the main axle, and the brace-bar hinged to the main frame on a journal parallel with the main axle of a mowing-machine, substantially as described.

137,815.—*Harvester.*—GEORGE W. N. YOST, Corry, Pa., assignor to "ACME MOWER AND REAPER COMPANY," New York, N. Y. Application filed September 23, 1872.

The removable sleeve containing the bearings of the crank-shaft is held in place by an oil-cup, which also performs the office of a set-screw.

Claim.—The combination of an oil-cup with the main frame and the journal-bearing sleeve of mowing or reaping machine, substantially as and for the purpose described.

137,816.—*Seat for Harvesters.*—GEORGE W. N. YOST, Corry, Pa., assignor to "ACME MOWER AND REAPER COMPANY," New York, N. Y. Application filed September 23, 1872.

The seat-supports are hinged to the sides of the main frame and rest upon pivoted eccentrics, by the rotation of which the seat may be raised or lowered.

Claim.—1. The combination of adjustable cams with an operator's seat hinged to the main frame of a mowing or reaping machine, substantially as described.

2. The combination of adjustable cams with foot-rests attached to an operator's seat hinged to the main frame of a mowing or reaping machine, substantially as described.

137,817.—*Mowing-Machine.*—GEORGE W. N. YOST, Corry, Pa., assignor to "ACME MOWER AND REAPER COMPANY," New York, N. Y.—Case B. Application filed September 16, 1872.

A lifting-lever, journaled on the inner end of the main axle, is connected by one chain to the coupling-frame and by another, somewhat shorter, to a rolling-lever journaled on the coupling-frame, and having its lower end bent at right angles, so as to press upon the inner projecting end of the finger-bar. Thus, when the lifting-lever is drawn back, the outer end of the finger-bar is first raised, and then the coupling-frame and finger-bar are lifted together.

Claim.—The arrangement of a finger-bar lever, hinged horizontally on the connecting-frame, on the outer side of and rocked at a right angle to the rolling direction of a main driving-wheel, laid on the inner end of the finger-bar, between the finger-bar hinge and the main frame, and worked by a lifting-lever on the outer end of the main axle of a mowing-machine, substantially as described.

137,818.—*Heating-Stove.*—WILLIAM R. AKERS and JAMES E. JOHNSON, Malcolm, Iowa. Application filed February 21, 1873.

Air enters the chamber through an orifice in the base of the stove, and thence is conveyed by means of a tube through the fire-chamber and the hot-air chamber to the smoke-chamber.

Claim.—The arrangement of the air-chamber B, the tube V, fire-chamber R, hot-air chamber N, and smoke-chamber P, substantially as specified.

137,819.—*Railroad-Rail Joint.*—FRANKLIN A. SEABERT and RICHARD ANTHONY, Kingston, Pa. Application filed August 30, 1872.

The spring fish-plate, by its elasticity, in connection with the longitudinal rib and groove in the nut, prevents the nut from turning.

Claim.—The fish-plate D, constructed as described, with its upper and lower edges bent inward, and with a central longitudinal rib, *a*, in combination with the grooves *b b* in the nut G, substantially as and for the purposes herein set forth.

137,820.—*Process of Using Anthracite-Coal Dust as Fuel in Furnaces.*—ALFRED BERNEY, Jersey City, N. J. Application filed April 9, 1873.

By a means of a forced blast channels are kept open through the mass of coal-dust. The fire is first started by bituminous coal. The grates are made with numerous openings, so as to evenly distribute the blast.

Claim.—1. The improved processes herein described for using anthracite-coal dust, slack, or screening, with bituminous coal or dust, as fuel to generate heat, the same consisting in adding or using anthracite-coal dust, slack, or screenings, with or without bituminous coal or dust, to the fire in furnaces, as described, so as to utilize the anthracite dust in generating heat.

2. The process of making artificial crevices by force of air in the use of anthracite dust, slack, or screenings alone, or in combination with bituminous coal or dust, or with anthracite coal, to generate heat, substantially as described, and for the purpose set forth.

137,821.—*Pruning-Shears.*—PETER BROADBOOKS, Batavia, N. Y., assignor of one-half his right to CHARLES N. GROVE, same place. Application filed March 15, 1873.

Two ordinary blades of a pair of pruning-shears are separated, and, by means of hooks and slots, are both united with a third cam-blade or rotating cutter. Thus several pairs of cutting-edges are afforded and blades are furnished, working at different angles to accommodate different-sized limbs.

Claim.—The combination of the blades A, B, and F, as described, A being furnished with hooks and B and F with perforations, whereby the blades B and A may be used either with or without the blade F, all substantially as herein shown and described.

137,822.—*Water-Wheel Gate.*—JOHN M. BURGHARDT, Great Barrington, Mass. Application filed July 13, 1872.

Stationary chutes are attached to the curb, and movable chutes or tongues project from the plate of the gate and pass through the water-apertures in the curb. The movement of the gate is limited by these apertures, and when it is turned in one direction the movable chutes come in contact with the stationary chutes and thereby cut off the water. By an opposite movement the water-apertures may be made of any desired size.

Claim.—The stationary curb A, having apertures H, chutes E, face D, and center F, combined, as described, with rotary gate having plate I with movable chutes C, arranged as and for the purpose described.

137,823.—*Hose and Pipe Coupling.*—THEODORE E. BUTTON, Watertord, N. Y., assignor to himself and L. BUTTON, same place. Application filed January 11, 1873.

To one of the pipes to be connected is hinged a screw-nut made in two parts, each part being hinged to opposite sides of the pipe. A binding-ring, made to fit the outside of the nut, holds the two parts together.

Claim.—The combination, in a pipe or hose coupling, of the hinged sectional screw D and binding-ring F, substantially as and for the purpose hereinbefore described.

137,824.—*Button.*—MARY P. CARPENTER, New York, N. Y. Application filed February 8, 1873.

The button has an eye made of a piece of wire bent into proper form, having its ends flattened and pointed and a screw-thread cut upon them.

Claim.—1. A button eye made of a piece of wire bent into proper form, and having its ends flattened upon their inner side and pointed, and a screw-thread cut upon them above the taper, substantially as herein shown and described.

2. An improved button, formed by the combination of a head, A, having a screw-hole formed in it with the open-shanked eye B, constructed substantially as herein shown and described.

137,825.—*Cotton-Stalk Knocker.*—MARVELL M. CARRUTH, Helena, Ark. Application filed December 31, 1872.

A rectangular frame is mounted upon two wheels, and upon the rear end of the frame a revolving knocker is attached, and this knocker receives motion from the bearing-wheel by means of an accelerating pulley and band.

Claim.—The shaft H and pulleys G I mounted in the upper ends of the vertical bars D of the frame, the revolving knocker and its pulleys arranged at the lower ends of said bars, said parts being connected with each other and the driving-pulleys E by belts F J, as shown and described, for the purpose specified.

137,826.—*Boiler-Tube Scraper.*—JOHN B. CHRISTOFFEL, Williamsburg, N. Y. Application filed February 15, 1873.

A series of spiral plates attached at their ends to two collars, having pins on them for that purpose, which plates are compressed or extended by the action of spiral springs operating upon the said collars.

Claim.—1. The springs C, notched and combined with the radial pins and movable collars, as described, to hold said springs firmly to rod A, but allow them to readily contract and expand thereon.

2. The combination, with springs C secured as set forth, of the inner stops D D, the outside washers E, and the springs F, arranged and applied as set forth.

137,827.—*Manufacture of Corrugated-Metal Shutters.*—ALEXANDER CLARK, London, England. Application filed March 26, 1873.

To gradually change the dimensions of the corrugations to admit of close coiling, the corrugating-cylinder is placed concentrically within a curved guide and co-operates with sets of loose dies or teeth, each set being of less dimensions than the preceding one, which teeth are successively drawn in by the teeth of the cylinder and carried around between it and the guide.

Claim.—1. Metallic revolving shutters, provided with the corrugations of each convolution, varying in dimensions, substantially as and for the purpose hereinbefore described.

2. The method of passing successive portions of sheet metal between corrugating-dies upon one another, and without changing the corrugating-roll, as and for the purpose set forth.

3. A series of sets of corrugating-dies, D, a corrugating die-roll, C, and a curved table B, combined as and for the purpose described.

137,828.—*Invalid-Bedstead.*—OSCAR G. COSBY, Richmond, Va. Application filed February 21, 1873.

The mattress-frame is mounted on vertical-toothed slides, and raised and lowered by means of cog-wheels, shafts, and cranks. Above the mattress-frame is arranged the canvas-frame, having jointed rollers so that the head-section can be adjusted at any desired inclination. The canvas has an opening under which to place a vessel, which, when used, is placed on the mattress, which is lowered a suitable distance.

Claim.—The frame B mounted at each end in a vertical-toothed slide, and the canvas M having jointed rollers combined with mechanism, substantially as described, and for the purpose set forth.

137,829.—*Cloth-Measuring Register.*—SAMUEL CROCKER, Port Allen, Iowa. Application filed January 11, 1873.

At the extremity of a yard-stick or other measuring-scale a spring registering-wheel is so arranged as to move one tooth and carry the index one unit at each touch of the thumb as the measure is effected. A supplementary adjustable index, being set to the number of yards desired to be measured, forms a stop to the register when that number is actually measured.

Claim.—An improved cloth measure and register, formed by the combination of the base-plate A, pivot B, double ratchet-wheel C, top or scale-plate D, ratchet-wheel E, stop F f', scale G g^1 g^2, mainspring H, lever-pointer I, adjustable bar J, and spring-catch K L with each other, said parts being constructed and operating substantially as herein shown and described.

137,830.—*Dovetailing-Machine.*—THOMAS CULLEN, Blackstone, Mass. Application filed February 8, 1873.

A series of laterally-adjustable saws are arranged in a reciprocating frame, and act in connection with a table having a longitudinal, lateral, and partially-rotating movement.

Claim.—1. The combination, with the feeding-carriage J' and table A^1, of ways G^1, arranged to feed the work longitudinally and obliquely, in the manner described.

2. The combination of the stops E^1 E^2 and stop-pins E^4 with the carriage J', arranged substantially as specified.

3. The combination of the bars C D E G J N and the rods F, in the manner described.

4. The saws connected to the slotted bars C by the swiveled studs B, substantially as specified.

5. The combination of the stops Y, bars G, cross-bar N, pin O Q, face-plate K, and adjusting-screw R.

6. The combination of the plate L' and bars M' with the work-table, the oscillating carriage I', and the carriage J', substantially as specified.

137,831.—*Bee-Hive.*—SAMUEL T. DAVIS, Millersville, Pa. Application filed December 12, 1872.

Separate frame-cases slide in endwise in grooves, and have glass ends, glass window at one side, the other side woven wire, a horizontal bar on top, and a diagonal bar on the wire side, these bars having each a line of holes registering with or covering holes in the frame to shut the bees in or out. At the further or porch end a slide in the frame-case is operated by a pin passing through a slot in the hive-wall.

Claim.—1. The arrangement, in a bee-box, of the removable sections H H', provided with top and side slide-valves *k* A, sliding frames I, together with the glass side and door L E, bee-door and stem *m p*, all substantially constructed and operated in the manner and for the purpose specified.

2. A bee box or hive, when it is provided in front with slits *d d* for the projecting stem *p* of the section-doors *m*, drone-outlets *s s*, and drone and moth inlets *n n* leading to the drawer *f*, with their valved passages, all arranged substantially in the manner and for the purpose described.

137,832.—*Metallic Sky-Light.*—GEORGE E. DAYTON, Baltimore, Md. Application filed March 17, 1873.

An improvement upon the "Hayes" patents, by which the rabbet is dispensed with, fastening-wires being substituted, which perforate the polygonal cap and are bent down and soldered. The ridge-bar is of the form of a rhomboidal tube, capable of being altered in shape by pressure to accommodate it to different pitches of roof. The sash-bar J permits the sky-light to be opened. The cross-bar K prevents leakage between two successive panes.

Claim.—1. The glass-support bar B, made flat on top, as described, to avoid the necessity of a rabbet.

2. The fastening-wires applied to cap F, as and for the purpose set forth.

3. The ridge-bar G, constructed without rabbet and adapted to different pitch of roof, as specified.

4. The flashing I turned up on edge to form a gutter, *i*, and applied to the wooden curb H, as and for the purpose described.

5. The opening sash-bar J, constructed and applied, in connection with the glass-supporting bars, as and for the purpose set forth.

6. The cross-bar K, constructed, arranged, and applied between the bars B^2 B^2 and the two lengths of glass, as and for the purpose specified.

137,833.—*Construction of Houses.*—DAVID L. EMERSON, Oakland, Cal. Application filed December 16, 1872.

The walls are each braced by vertical rods or plates and by anchors passing through them, the plates and anchors being connected by strap-iron, which is also worked through the courses. The several walls are united and bound by horizontal tie-rods secured to vertical plates at the corners. Object—an earthquake-proof house.

Claim.—1. A structure composed of plane walls of masonry, wherein each wall is separately tied and braced, substantially as set forth, and is united to the adjacent wall by having the ends of its horizontal tie-rods joined to a vertical brace situated within or exterior to this adjacent wall, in the manner substantially as described.

2. The combination formed by the arrangement of the strap-iron with the uprights.

3. The combination and arrangement of the strap-iron with the anchors.

4. The combination and arrangement of the strap-iron, anchors, and uprights.

5. The combination and arrangement of the brace *s''*, or its equivalent, with the uprights and rods, or with one or more of either separately.

137,834.—*Bee-Hive.*—CHARLES FINN, Des Moines, Iowa. Application filed February 13, 1871.

An improvement on Patent No. 102,526, May 3, 1870, consisting of a double-wall bee-hive, the outer wall formed of a series of uprights lined with paper, the inner wall composed of alternate layers of wood and paper, the space between the walls to be filled with straw or its equivalent.

Claim.—The combination of the inner wall A A, when composed of alternate layers of wood and paper, substantially as described, the paper C, and the series of uprights B B, in the manner and for the purposes set forth.

137,835.—*Manufacture of Glue.*—OSCAR S. FOLLETT, Mont Clair, N. J. Application filed March 31, 1873.

The glue cake or jelly is placed in a close box or chamber with a water-absorbent, such as chloride of calcium.

Claim.—1. The process herein described for drying glue, the same consisting in inclosing it in a chamber with a water-absorbent material, substantially such as herein described.

2. The apparatus herein described for removing water from glue, consisting of a closed chamber, a series of removable frames for supporting the glue-cakes, and a series of boxes or trays for containing chloride of calcium or other hygrometric substance.

3. The method herein described for aiding in eliminating the water by forming perforations in the cakes of glue, as set forth.

4. The combination of a closed chamber, provided with frames for supporting the glue and trays or boxes for containing a water-absorbent material, with device for either heating or cooling the interior of the chamber so as to maintain a regulated temperature in the chamber, as set forth.

5. The improved article of glue in plain or perforated sheets.

137,836.—*Turbine Water-Wheel.*—JOHN C. GREEN, Flanders, N. J. Application filed December 21, 1872.

Each gate spindle or shaft has a head-piece with arms on opposite sides of the axes, a tooth between said arms, and a toothed segment of about four teeth immediately below the tooth which is larger and longer than the teeth of the segment. In connection with the head is arranged a disk having two notches with a toothed segment to each notch, placed diametrically opposite each other. The segments on the disk gear with the gates as they come to them, and open and close them successively, according to the way the disk is turned. The arms of the gate-spindle come against the face of the disk and prevent the gates from being turned too far.

Claim.—The combination of the disk N, having one or more notches, and toothed segments Q, as described, with the gates having arms J K, tooth L, and a toothed segment, M, substantially as specified.

137,837.—*Carving-Machine.*—HENRY GRUBENBECHER, New York, N. Y. Application filed October 26, 1872.

The pattern and work are fastened to a pantograph-frame and applied to a revolving guide-point and a cutting-tool which copies the pattern.

Claim.—1. The plate G that holds the block and pattern combined with a jointed frame, D, balanced in a horizontal position by weights or springs, as and for the purpose described.

2. The combination with plate G, supporting both block and pattern, of the tool *a* and pin *b*, operating therewith, as and for the purpose set forth.

3. A block and pattern-plate, G, provided with the brackets *t u v*, having centering-pins *w*, of which the middle one is swiveled, as and for the purpose specified.

137,838.—*Hot-Air Furnace.*—JOHN D. HALL, Brooklyn, N. Y., assignor to MARY E. J. HALL, same place. Application filed February 13, 1873.

The upper portion of the radiator or combustion-chamber is but a short distance above the surface of the burning fuel, and this radiator, in connection with the perforated sides D of the fire-pot, forms a lateral passage for the products of combustion, except when the damper E at the rear being open, the draft is direct. The central elevated portion of the grate within the upwardly-contracted portion of the fire-pot has a reciprocating motion.

Claim.—1. A hot-air furnace radiator or combustion-chamber A having its upper central portion brought down near to and about parallel with the surface of the fire and its sides or perimeter sufficiently extended laterally to admit of the formation of a horizontal smoke-flue therein by means of the plates D, substantially as set forth.

2. The combination of the lateral draft-plates D and the damper E with the herein-claimed radiator, substantially as shown and described.

3. The combination of the herein-claimed radiator with a fuel or feeding magazine, B, substantially as described.

4. The combination of a fire-grate, M' M'', having an elevated vibrating central part, M, with the radiator A, substantially as shown and described.

5. The combination of the upwardly-contracted fire-pot K with the herein-described radiator.

137,839.—*Coffee-Roaster.*—JAMES HART, Kekoskee, Wis. Application filed March 1, 1873.

As none of the volatile oils which give aroma to the coffee can escape, the roasted beans gradually absorb the same again.

Claim.—The coffee-roaster A, consisting of two shells joined by flanges *a* having opening *b*, cover B, and handle connection C, and lug *c*, substantially as and for the purpose described.

137,840.—*Manufacturing Matches.*—OLIVER H. HICKS, Baltimore, Md. Application filed March 7, 1873.

Dip in paraffine, or other equivalent, after the head or friction portion has been applied.

Claim.—A match, constructed substantially as herein described—that is to say, by dipping it in paraffine or other equivalent, after the head or frictional portion has been applied, substantially as and for the purpose specified.

137,841.—*Door-Bolt.*—ADOLPH G. HOFSTATTER, New York, N. Y. Application filed March 8, 1873.

A semi-cylindrical plate is interposed between the bolt and central or slotted keeper, and arranged to be moved so as to close the slot in the said keeper, and thus lock the bolt when it is thrown forward.

Claim.—The semi cylindrical plate E in combination with the plate A, bolt B, and keepers C D, of an ordinary slide-bolt, substantially as herein shown and described, and for the purpose set forth.

137,842.—*Corn-Sheller.*—FRANKLIN HOLLEN and AMOS C. HOLLAND, Marion, Ill. Application filed February 15, 1873.

The ear of corn is drawn across the fluted bars of the grate, the sharp edges of which remove the kernels from the cob, the box keeping the kernels from flying about and guiding them into a receiving bag or vessel.

Claim.—1. The shelling-grate B formed of a series of transverse bars fluted or grooved upon their upper sides to form sharp or cutting edges, as specified.

2. The combination of the box A a', shelling-grate B, bars C, short legs E, and adjustable long leg F, with each other, substantially as herein shown and described.

137,843.—*Cooking Apparatus.*—CORNELIUS HOOD, Seneca Falls, N. Y. Application filed February 12, 1873.

Steam and odors pass through the condensing-chamber and the central tube to the exit-flue of the heater on which the vessel is placed, or a pipe leading from the top of the vessel may connect with a section of pipe fixed in a stove-lid.

Claim.—1. In a culinary boiler or steaming apparatus, the combination of the condensing-chamber D provided with a removable top, c, and pipe E, the detachable tube A provided with a valve or stopper, a, and the exit-pipe B, all constructed and operating together as and for the purposes described.

2. A stove-cover provided with an aperture, as described, when combined with a tube connected with a boiler or other culinary vessel.

137,844.—*Crayon-Holder.*—ANDREW F. HOWARD, Waltham, Mass., assignor to ZENAS PARMENTER and AMORY H. WALKER, same place. Application filed March 29, 1873.

The slitted tapering end of a metallic cylinder is compressed by a tapering collar to clamp the projecting crayon introduced through the opposite end, which is closed by a cap.

Claim.—The improved article of manufacture or port-crayon, composed of the tapering and slitted tube A, the thimble or cap C, and the tapering or tubular collar B, constructed and arranged essentially as shown and described, the crayon receiving-mouth in such port-crayon being at the upper end or part of the article, as set forth.

137,845.—*Grain-Basket.*—HORACE C. JONES, Dowagiac, Mich. Application filed December 6, 1871.

One series of staves extending from side to side across the bottom, each stave overlapping each succeeding stave in such manner that each stave forms a portion of the inner and a portion of the outer surface of the sides of the basket. Two strengthening-staves are applied to either or both the outside and inside of the basket.

Claim.—1. A basket constructed of one series of staves, B, extending from side to side across the bottom, each stave overlapping each succeeding stave in such manner that each stave forms a portion of the inner and a portion of the outer surface of the sides of the basket, as and for the purposes set forth.

2. The staves C C, in combination with the lapped staves B, substantially as described.

137,846.—*Grain-Basket.*—HORACE C. JONES, Dowagiac, Mich. Application filed February 4, 1873.

The lining or inside series is composed of a series of short staves, which overlap one another, each alternate stave of such series terminating under the bottom hoop and the others extending beyond such point and terminating just within or near said hoop. The outside series extends from the top on one side across the bottom to the top on the other side.

Claim.—The stave basket, having an inside lining, A, composed of a series of short staves which overlap each other along one of their edges, each alternate stave of such series terminating under the bottom hoop B and the others extending beyond such point and terminating just within or near said hoop, in combination with an outside series of staves extending from the top on one side across the bottom to the top on the other side, substantially as described.

137,847.—*Wash-Board and Rubber.*—CHARLES KREBS, Wilmington, Del. Application filed February 1, 1873.

An elevated corrugated surface, at the upper part of which is a tube with openings connected with flexible pipe. The rubber is journaled to jointed shafts that are pivoted between the ends of the wash-board.

Claim.—1. In a combined wash-board and reciprocating rubber, the shaft D journaled between the ends of the corrugated portion A, and having its extremities bent, as shown and described, in combination with the reciprocating rubber E', and with the arm or shaft E having its ends bent and jointed to the shaft D, substantially as and for the purpose specified.

2. The combination, with the wash-board A, of the tubes B and C, constructed and arranged substantially as specified, to permit of a continuous flow of clean water over the surface of the board.

137,848.—*Handle for Sheet-Metal Ware.*—J. WARREN LAMB, Troy, N. Y. Application filed January 3, 1873.

Claim.—An inclosed handle for sheet-metal ware, having its base grooved for the reception of the edge of the vessel, and rigidly attached thereto, substantially as described.

137,849.—*Filter for Cane-Juice, Oils, and other Dense Liquids.*—ARCHIBALD K. LEE, Galveston, Tex. Application filed April 5, 1873.

The filters of different-sized meshes are connected to the removable kettle. The kettle is surrounded by a steam-chamber, from which a series of coils pass beneath the bottom of the lower filter to preserve an even temperature at the point where greatest liquidity of the material to be strained is required.

Claim.—1. The steam-pipes C C, arranged in connection with a strainer or filtering surface, as to operate substantially as described.

2. The vessel A, having a steam-chamber, B, formed as shown, and the pipes C C, the whole being combined and arranged to operate substantially as described.

3. In combination with the vessel A, the independent kettle D, having at its lower section a straining or filtering surface, E, the whole being constructed and arranged as to permit of the kettle being removed at pleasure, whereby a series of kettles can be used in connection with the same vessel, as and for the purpose specified.

4. The vessel A, kettle D, strainer E, having close meshes or small openings, and the coarse strainer F, the whole being so combined and arranged as to operate substantially as described.

137,850.—*Machine for Cutting and Perforating Cigars.*—JACQUES LEVY, THEODORE LEVY, and ARMAND LEVY, New York, N. Y. Application filed March 8, 1873.

The form-block containing the cigar-"bunches" is placed beneath a series of notched perforators attached to a cross-bar having guides at each end working upon slides and held up by spiral springs. The perforators are depressed by a treadle-movement beneath the table, and enter the cigar-forms in the block, which is held in place by a clamp-lever and adjustable plates. A blade acts in connection with a guide-roller to cut off the tuck.

Claim.—1. The needle-bar C having cylindrical guides d and ears e, in connection with standards B, springs D, and bolt treadle-connection f h i, substantially as described.

2. The notched cigar-perforators E, for the purpose specified.

3. Adjustable plates H having guides K, nuts n set by bolts l, and wheels m, substantially as set forth.

4. The clamp-lever I moving in recess p of table A, producing the rigid position of form-blocks G, substantially as described.

5. The blade F with guide-roller q at front edge of table, operating in combination with form-block G for cutting off tucks, as specified.

6. The combination of the cigar-perforators E, bar C, standards B, springs D, treadle mechanism form-blocks G, adjustable plates H, lever I, and table A, as shown and described.

137,851.—*Paper-File.*—CHARLES D. LINDSEY, Cincinnati, Ohio. Application filed August 10, 1872.

The paper is forced onto the paper-fasteners, supported on tongues, which are adjustable longitudinally on the base-plate by an upper spring-seated plate, J.

Claim.—A paper-file, consisting of frame A B C, plate D E, tongue-plates k i n, spring K, finger L, and thumb-piece M, each constructed and arranged substantially as described.

137,852.—*Machine for Grinding Horseshoe-Calks.*—JOHN LITTLE, Newburg, N. Y. Application filed February 24, 1873.

The grinding and cutting wheels are attached to same shaft, which is capable of adjustment to any desired position.

Claim.—The portable compound machine, consisting of the grinding-wheel A and cutter Y, arranged on the same shaft, and capable of being adjusted to any desired position by the means substantially as herein shown and described, and for the purpose set forth.

137,853.—*Station-Indicator.*—JAMES K. MAGIE, Canton, Ill. Application filed January 18, 1873.

A pin-wheel strikes a stop on track and its shaft gears with a vertical shaft, on which is fixed the four-lobed cam, which, in turning, forces asunder spring push-plates until their points pass the tips of the cam's lobes, when springs draw them together again, and the spoke of the pin-wheel having cleared the track this wheel completes its quarter-turn by the action of the spring. The vertical shaft gears with an upper horizontal shaft, on which is the name-strip. To prevent the springs carrying the cams too far arms are applied to the shaft and stop-blocks on the frame for said arms to strike against. That the arms may move on again, they are pivoted to the shaft so as to rise and fall, and an incline, also pivoted, is placed in front of each.

Claim.—The combination, with a railway-indicator apparatus, of pivoted arms M and two stops, N, and inclines O, the stops having a notch, P, in the lower part, the inclines being arranged relatively thereto, and pivoted as described.

137,854.—*Composition Paint-Oil.*—JAMES MCGAFFERTY, New York, N. Y. Application filed February 21, 1873.

Claim.—A prepared paint-oil formed of resin, oxide of manganese, linseed-oil, refined petroleum-oil, and liquid rubber, applied together in the manner and proportions specified.

137,855.—*Coal-Stove.*—HEINRICH MEIDINGER, Carlsruhe, Germany, assignor to himself and FREDERICK GUTZKOW, San Francisco, Cal. Application filed November 25, 1872.

The lower part of the fuel-chamber has a crescent-shaped throat-plate connecting with a bottom piece having a mouth-piece. The door and the mouth-piece are connected by a hinge so that the former can slide.

Claim.—1. The fuel-chamber A provided with the crescent-shaped plate d, or equivalent device, which forms a throat or contraction in its lower part, as set forth.

2. The bottom piece C, made in one piece with the plate d, and provided with the mouth-piece b, as shown.

137,856.—*Motive Power.*—GUSTAVUS MEYER, New Richmond, Mich. Application filed March 15, 1873.

Adjustable lever, in three parts, suspended by fulcrum-hook, operated by ropes connected with rocking-chair, alternate motion of which furnishes the motive power.

Claim.—1. The adjustable lever A B C F G, constructed substantially as herein shown and described.

2. The combination of the adjustable lever A B C F G, fulcrum-hook D, ropes H, guide-pulleys I and J, and rocking-chair K with each other, substantially as herein shown and described, and for the purpose set forth.

137,857.—*Trimming.*—WELWOOD MURRAY, New York, N. Y.—Case A. Application filed March 1, 1873.

The fabric is plaited into bias box-plaits and then folded on a longitudinal line to form two flounces of plaiting.

Claim.—As a new article of manufacture, the trimming composed of a bias box-plaited strip of plain lace or other suitable goods, with the edges trimmed with figured lace or other trimming, and folded, substantially as represented in Figs. 1 and 3.

137,858.—*Trimming.*—WELWOOD MURRAY, New York, N. Y.—Case B. Application filed March 1, 1873.

Claim.—As a new article of manufacture, the trimming composed of plaited ruching of net, whether known as illusion, Mechlin, bobbin, or Brussels net, combined with plaited and pointed muslin, substantially as described and represented in the drawing.

137,859.—*Artificial Stone.*—ADOLPH OTT, New York, N. Y., assignor to THOMAS F. WELLS, same place. Application filed March 27, 1873.

Claim.—The compound for and process of manufacturing artificial stone, composed of hydraulic cement, silex or minerals containing silex readily soluble in alkalies, lime, and dolomite, substantially as described, and in the proportions set forth.

137,860.—*Car-Coupling.*—DANIEL O. PENDER, Palmyra, Mich. Application filed February 20, 1873.

The coupling-hook is raised by the crank-shaft and sustained by a spring acting on the cam until its end is struck by the entering link.

Claim.—The crank-shaft E, having cam G and arm F and spring C, in combination with the trip-bar D of the draw-head, as described, and for the purpose set forth.

137,861.—*Cutter for Tonguing and Grooving Lumber.*—DANIEL PERRIN, McGregor, Iowa. Application filed December 14, 1872.

The side-cutting tools are combined with the cutter to form the tongue, and are joined together behind a suitable cutter to form the groove and clear both of the fuzz or splinters.

Claim.—The cutters C, made of equal breadth with, and of half the depth or thickness of, the cutters A B, to adapt them to be used in pairs, as herein shown and described, and for the purposes set forth.

137,862.—*Wheelbarrow Dumping-Car.*—HENRY J. PETERS, Quebec, Canada. Application filed January 11, 1873.

Claim.—The shell A of a dumping-car, constructed of a flat basin-like shape, and provided with suitable ears g, guide-segments e, bolsters B, caps h, and pivots f, as described, so that it requires no turning of doors at the sides, but merely a dumping.

137,863.—*Thrashing-Machine.*—CHARLES M. POWERS, Ridgewood, N. J. Application filed February 8, 1873.

Grain separated from the straw by means of a vertical beater and a stationary corrugated and perforated bed, through which the grain passes to the sieves, while the straw is carried off by an endless apron.

Claim.—1. A machine for thrashing grain, having a stationary bed and a vertical beater for beating out the grain, in combination with one or more endless aprons, arranged substantially as described.

2. The pin-wheel K, lever N, and transverse bar M, arranged in combination with the beater F, substantially as and for the purposes described.

3. The sieves T and fan U, in combination with the bed C and beater F, as and for the purposes described.

4. In combination with the beater F, bar M, lever N, and wheel K, the spring S, as and for the purposes described.

137,864.—*Animal Cage-Trap.*—SYLVESTER W. RICE, Roseburg, Oreg. Application filed February 1, 1873.

The tilt-lever plates, in connection with the adjacent end plates, admit of entrance at either end of the trap, which is also provided with a self-closing door to prevent return of the animal.

Claim.—The trap composed of the treadle B, which carries the perforated plates g and h, and which is arranged within a box, A, having the plates i j, to operate substantially as described.

137,865.—*Motor-Engine.*—THOMAS D. RICHARDSON, North Providence, R. I. Application filed December 16, 1872.

The conduit from the supply-pipe gradually diminishes in size until its top and bottom meet and entirely surrounds the wheel. Water is admitted from the conduit to the middle of the wheel through curved ports at regular distances apart. The buckets of the wheel are concavo-convex in form, being highest in the middle. The water is discharged from the extremities of the buckets into the surrounding case, whence it escapes by the waste-flume.

Claim.—1. The wheel E, with its concavo-convex buckets x x, arranged as shown.

2. The diminishing conduit D, with its series of ports F F, and surrounding the circumference of a wheel, for the purpose of discharging water or steam upon the same.

3. The combination of the diminishing conduit D with its ports F F, the wheel E with its concavo-convex buckets x x and axle G, the case A with its feed-pipe B, and waste-pipe C, all made and used substantially as described.

137,866.—*School Desk and Seat.*—JOHN B. SHERWOOD, Chicago, Ill. Application filed March 19, 1873.

The folding seat-arm is supported by a three-plate hinge. The plate attached to said arm rotates between the standard-plate and a cap-plate and strikes against rubber buffers dovetailed into projecting lugs, and the cap-plate is screwed fast to the standard plate, and kept from rotating by means of pins projecting out from said lugs.

Claim.—A hinge or joint for folding seats for school-desks, consisting of the standard-plate J, arm-plate I, and cap-plate F, when constructed and combined as and for the purpose set forth.

137,867.—*Refrigerator Water-Cooler.*—THOMAS SMITH, Brooklyn, N. Y. Application filed March 15, 1873.

A rectangular hollow casing surrounding the ice-chamber and having an inclined bottom, beginning at the highest point of the partition and running along the sides of the ice-chamber until it reaches a point below the starting-point, where there is an outlet for the liquid.

Claim.—In combination with the ice-chamber of a refrigerator, a cooler, C, having an inclined bottom, and funnel d and faucet e, as shown and described.

137,868.—*Cradle.*—DAVID SOUDER, Houston, Ohio. Application filed March 8, 1873.

Two frames crossed and pivoted at their center with bars across their ends, from which, by straps, is suspended the frame to which is attached the sacking bottom for the cradle, and made to adjust in its tension by holes, which are fitted to the holding-screw on the cross-bars.

Claim.—The combination of folding frame A with bottom frame B by means of buttons g and adjustable bands h, constructed substantially as and for the purpose described.

137,869.—*Stilt.*—GEORGE J. STEVENS, Charlestown, Mass. Application filed February 12, 1873.

To the usual foot-rest, sliding up and down the pole, is attached a toothed cam-wheel for adjusting said rest to any height desired.

Claim.—As an improved article of manufacture, the above-described stilt, consisting of the standard A, step B, sleeve C, braces D D, and cam E, the whole being formed, arranged, and operating together, in the manner as shown and described.

137,870.—*Plow.*—STEPHEN L. STOCKSTILL, Medway, Ohio, and HENRY D. KUTZ, Harrisburg, Pa. Application filed September 7, 1872.

Claim.—The plow-beam, provided with perforated ears a a, and the pin b formed on the end of the axle C, the sleeve c, and set-screw d, all arranged as shown and described, for the purpose of allowing vertical adjustment of the axle, as specified.

137,871.—*Convertible Freight-Car.*—WILLIAM WORSLEY, Little Falls, N. J. Application filed November 11, 1871.

Detachable sections forming a hopper-shaped floor are arranged in combination with a spout, through which the grain is discharged.

Claim.—1. The V-shaped detachable sections A B applied to a grain-car, substantially as and for the purpose described.

2. The nozzle E, combined, as described, with swiveled elbow-spout, so that the grain may be discharged on either side of the car from the same nozzle.

137,872.—*Vulcanizing Rubber-Coated Articles.*—ANDREW ALBRIGHT, Newark, N. J. Application filed February 8, 1873.

Buckles, harness-trimmings, and the like are coated with the compound to form hard rubber and suspended in the vulcanising-chamber.

Claim.—The process of vulcanising rubber-coated harness and carriage-trimmings by the direct action of steam or dry heat on separately-supported articles, substantially as described.

137,873.—*Manufacture of Rubber-Coated Harness-Trimmings.*—ANDREW ALBRIGHT, Newark, N. J. Application filed March 25, 1873.

The article to be coated, surrounded by the coating material, is placed in the die, which is so constructed that the pressure is applied equally on all sides; the coating material being compressed against the article, any extrusion of material avoided, and the use of cutting-edges on the dies dispensed with.

Claim.—1. The die A B, constructed substantially as described, for pressing and finishing composition-coated harness or carriage-trimmings without leaving any refuse material in them, as set forth.

2. The compound die C D E, constructed substantially as described, for pressing and finishing composition-coated harness and carriage-trimmings without leaving any refuse material in them, as set forth.

137,874.—*Hub for Heavy-Wheeled Vehicles.*—JAMES J. ANDERSON, Indianapolis, Ind., assignor of two-thirds his right to GARRETT H. SNOVER and GEORGE W. MILLER. Application filed January 16, 1873.

Claim.—The combination, with the arms a d arranged on both sides of the spokes e f, of the clamping-bands m n, arranged to clamp the arms at the bases thereof, as shown and described.

137,875.—*Magnetic Chuck for Lathes and Planers.*—JAMES ARCHIBALD JAQUES, Tottenham, JOHN THOMAS OAKLEY, Grange Road, Bermondsey, and LOUIS STERNE, Westminster, England. Application filed December 17, 1872.

The face-plate of the chuck is in two parts, and these are confined to the back plate by two pillars, around which are coils of insulated wires. Two grooved brass bands extend around the casing, but are insulated from it by rubber, and into their grooves are inserted contact-points on springs that conduct the current from the wires of the battery to the wires and coils inside of the casing, the effect of the current being that of converting the plates into powerful magnets.

Claim.—1. Constructing magnetic chucks for lathes in the manner herein set forth.

2. Constructing the beds or tables of planing, drilling, slotting, and surfacing machines as herein set forth, and adapting thereto electro-magnets, so that articles of iron or steel placed thereon to be operated upon may be securely held while under operation, as above described.

137,876.—*Exercising-Machine.*—SAMUEL M. BARNETT, New York, N. Y. Application filed February 8, 1873.

To a rectangular frame is attached flexible stirrup-straps for exercising the legs, flexible pulling-straps for the arms, and an index with lifting-straps for the development of the whole body.

Claim.—1. The truncated pyramidal frame provided with elastic straps *l* and handles, suspended from the cross-bar *m*, as set forth.

2. The elastic straps *r*, stirrups *s*, and hand-rail *u*, as and for the purposes set forth.

3. The metallic loops *n*, stirrups *r*, and cross-pins *o*, in combination with the India-rubber spring-straps having loops at their ends through which the pins *o* pass, as set forth.

4. The scale-bars *g*, handles *h*, and India-rubber springs *k*, connected to the platform *d* by the joint-pins *f*, as set forth.

137,877.—*Fishing-Torch.*—SETH BARTHOLOMEW, Sturgis, Mich. Application filed March 7, 1873.

The perforated cresset, adapted for holding fragments of brick, is surrounded by a series of concentric deflectors. A concave shield is interposed between the torch and supply-reservoir.

Claim.—1. The foraminous funnel or cresset A, adapted for holding broken brick, and having one or more deflectors, G, for the purpose set forth.

2. The combination of the downwardly-tapering and perforated shell A, axial rod B, bottom C, cap E, and nut D, constructed and arranged substantially as described, to constitute a casing of the form represented, adapted for the reception of broken brick or other suitable absorbent, to retain the oil.

3. The convex-faced shield N, interposed between the open lamp or cresset and the reservoir, to deflect the flame and heated gases out of contact with the latter.

137,878.—*Combined Heater and Filter.*—WILLIAM T. BATE, Norristown, Pa. Application filed July 31, 1872.

This invention filters the water before it enters the heater. Passing through the heater it is again filtered by the second filter before it enters the boiler, the water in both cases entering from the bottom of the respective filters. Each filter is so arranged that when they become muddy the sediment or mud is blown out by steam.

Claim.—The combination of a feed-water heater, filters B B′, and pipes or passages arranged to conduct the water through a filter both before and after it has passed through the heater, substantially as described.

137,879.—*Horse-Collar.*—EDWARD BATWELL, Ypsilanti, Mich. Application filed March 25, 1873.

The "throat" is strengthened or braced by a metallic plate to preserve shape of the collar and to prevent closing on the horse's shoulder.

Claim.—A plate, *a*, constructed as described, and attached to the inner lower end of a horse-collar, as and for the purpose set forth.

137,880.—*Whip-Socket.*—LORENZO D. BENNER, Boston, Mass. Application filed February 27, 1873.

To the lower end of a bent lever, which is pivoted within the whip-socket, is secured a notched latch. The whip, being inserted, presses back the lower end of the bent lever and the latch, the latter passing through a slot in the whip-socket, engaging with it, and securing the whip in place. The latch may be locked in place, if desired.

Claim.—1. A metal whip-socket, having the pivoted bar *c* with its flange *d*, the notched latch *e* being jointed to said bar, and securing it and through it the whip in position, substantially as described.

2. In combination with the pivoted bar *c* and its latch *e*, the bolt *f*, operated by a key, *m*, or other device, substantially as shown and described.

137,881.—*Hose-Pipe Nozzle.*—BAYARD A. BERRYMAN and ALANSON B. WAKEFIELD, St. Louis, Mo. Application filed March 17, 1873.

The interior of the hose-nozzle is formed with spiral creases, and has screwed upon the outer end a smooth-bore tip to impart a rotary motion to the water passing through the nozzle, which enables the water to be forced in a solid stream from the nozzle.

Claim.—1. The barrel A formed with spiral creases *a*, as and for the purpose set forth.

2. The barrel A having spiral creases *a*, in combination with the smooth bore tip C, as and for the purpose set forth.

3. The combination and arrangement of the barrel A, spiral creases *a*, and tip C with the chamber B, as and for the purpose set forth.

137,882.—*Railroad Frog.*—GEORGE W. BILLINGS, Chicago, Ill. Application filed October 8, 1872.

The spring-rail is re-enforced by a long elastic strip of angle-iron. The rails are held to the bed-plate by hooks headed beneath the bed-plate. The housing for the spring which returns the spring-rail has wings at the sides, which give an extended bearing on the rail at that point.

Claim.—1. The hooked rivet O, in combination with the rails and bed plate or plates G, as and for the purpose set forth.

2. A railway frog, consisting of the re-enforced spring-rail E, section B, stop J′, guide-bar J, in combination with the spring *c*, winged housing L, and rod or bolt K, substantially as and for the purpose set forth.

137,883.—*Sash-Fastener.*—GEORGE W. BISHOP, Saratoga Springs, N. Y. Application filed April 4, 1873.

A pivoted spring stop or fastener is locked, both when thrown forward and when withdrawn, by means of a double cam or eccentric tumbler, which is easily inserted in the case-opening when the spring-stop is removed. The stop is operated by a lever, which is close to the face-plate of the case, and works upon the stop through an arm which passes through a slot in the case.

Claim.—1. The tumbler H having double eccentrics, as shown, in combination with the lever B, the several parts being so arranged that said tumbler can only be attached and detached by the removal of said lever, substantially as specified.

2. In combination with the slotted plate A and lever B, the lever D with its projections, constructed and adapted to operate substantially as and for the purpose described.

137,884.—*Blast-Furnace.*—JAMES G. BLUNT, Leavenworth, Kans. Application filed April 5, 1873.

Surrounding the hearth are several combustion-chambers, into which the tuyeres deliver the blast at the base. Above the tuyeres are a series of jet-pipes for the introduction of hydrocarbon-gas and steam, the steam having been previously superheated in a coil of pipe located at a point of the combustion-chamber corresponding to the fire-bridge.

Claim.—1. The combustion-chamber D, in combination with the stack B, the bosh E, and hearth C, substantially as herein described, and for the purpose set forth.

2. The superheater *n*, in combination with the combustion-chamber D, the gas-pipe *b*, and tuyeres *a*, substantially as herein described, and for the purposes set forth.

137,885.—*Manufacture of Steel.*—JAMES G. BLUNT, Leavenworth, Kans. Application filed April 5, 1873.

Above the roof of the puddling-hearth, and communicating therewith by a series of flues, is a chamber containing a coil of pipe for heating the air-blast, which is delivered into the combustion flue or chamber at a point near the pipes, admitting the hydrocarbon-vapor and steam, the steam having been previously superheated in a coil of pipe located at a point corresponding to the fire-bridge. Passing through the furnace and surrounding the puddling-hearth is a pipe for introducing petroleum-vapors directly into the molten metal.

Claim.—1. The gas-pipe H and connections, in combination with the oven A, substantially as shown, and for the purposes set forth.

2. Superheater *m*, in combination with the combustion-chamber B, the gas-pipe C, and air-flues *b b*, substantially as shown, and for the purposes set forth.

3. The heating-chamber E, in combination with the oven A, the air flues or pipes *b b*, and the stack *f*, substantially as shown, and for the purposes set forth.

4. The process of manufacturing steel from pig or cast iron, the same consisting in boiling or puddling the iron to a point at or near what is known as "coming to nature," and then recarbonizing and converting the same into steel by means of petroleum-vapor or hydrocarbon-gas, substantially as set forth.

137,886.—*Manufacture of Sheet-Metal Vessels.*—JOHN G. L. BOETTCHER, Brooklyn, N. Y. Application filed January 30, 1873.

Claim.—The heads B B, formed with a groove, as shown, the inner wall *b* being vertical and the outer wall *c* inclined or V-shaped to receive the flange *a* of the vessel A, the whole being confined in place by solder, as herein set forth, for the purpose specified.

137,887.—*Turn-Table.*—ALFRED P. BOLLER, Orange, N. J. Application filed June 13, 1872.

The main carrying-girders are in pairs, to allow of the passage of the suspension-bolts between them, thus avoiding cutting and weakening the flanges. The shaft of the operating-pinion is supported in a vertical sleeve secured between a pair of channel-bars, which are bolted to the sides of the girders and braced by diagonal plates. The sleeve is further braced by stiffeners of angle-iron to aforesaid diagonal plates.

Claim.—1. The combination of double girders D D, beams M M, diagonal braces G G, and trucks F F F F, substantially as herein shown and described, and for the purpose set forth.

2. The sleeve I, shaft J, pinion K, secured to beams M M, forming a part of the structure of a turn-table, with angle or T iron braces H H, as and for the purposes herein described and shown.

137,888.—*Soldering-Machine.*—WILLIAM D. BROOKS, Baltimore, Md., assignor to MARY C. BROOKS and GEORGE D. BROOKS, same place. Application filed January 17, 1873.

The body to be soldered is clamped upon the hollow cylinder, wire solder placed along the seam, melted by a series of blow-pipes, and cooled by a horizontal air-pipe. The supply of gas and air is regulated by a three-way cock, operated by a single and double slotted bar and hand-slide.

Claim.—1. The hollow cylinder B, connected with the frame A by a small intermediate neck, *a*, and in contact therewith at no other point, as described, so that a minimum of the heat which the former receives from the blow-pipes will be lost by transmission to the latter.

2. The combination, with cylinder B that holds the can-body which is being soldered, of an air-pipe, J, arranged horizontally to force a current of cold air across the soldered seam of can, as and for the purpose specified.

3. The can-holding cylinder B, slotted at its top surface under the line of seaming, as described, to prevent the heat from being conducted too rapidly from the can-seam to the cylinder, and thus producing an imperfect joint.

4. The combination, with the cocks of air and gas pipes, of the single and double slotted bars M N and the hand-slide O, arranged to operate as and for the purpose described.

5. The air-pipe K and three-way cock L combined with burner, blow-pipes I g¹, and cooling-pipe J, as and for the purpose set forth.

137,889.—*Compressed-Air Motor.*—HENRY BUSHNELL, New Haven, Conn. Application filed February 21, 1873.

A jacket surrounds the cylinder, forming an annular chamber, into which air is forced by a suitable pump. A tube leads from this chamber, through a pressure-valve, to the exhaust-passage. The pressure is graduated so that the air will be compressed in the chamber until the desired degree of heat is obtained, when the heated air passes into the exhaust-passage, preventing the formation of ice in the exhaust.

Claim.—1. In a motor employing a compressed gaseous medium, the injection of heated air or its equivalent into the exhaust-passage from the said motor, substantially as and for the purpose described.

2. In combination with the cylinder A and its exhaust-passage N B, the air-pump E and pressure-valve H, substantially as and for the purpose specified.

3. In combination with the cylinder A and its exhaust-passage N B inclosed by a jacket, C, a valve, *f*, opening from the chamber formed by the said jacket into the valve-chamber *b*, substantially as and for the purpose specified.

4. In common with the cylinder A and its exhaust-passage N B inclosed by a jacket, C, a passage, L, leading from the chamber formed by the said jacket to said exhaust-passage, substantially as and for the purpose specified.

137,890.—*Tinner's Stove for Heating Soldering-Irons.*—CEPHAS A. BUTTLES, Milwaukee, Wis. Application filed August 21, 1872.

The opening for the reception of the soldering-irons in the front. The grate-bars and ash-pan placed transversely across the stove, and the double damper.

Claim.—1. The hearth F, constructed and applied substantially as and for the purpose set forth.

2. In a tinner's stove having an opening for the soldering-irons in the front, the application of the ash-pan transversely across the stove, with its opening at the side thereof, substantially as and for the purposes set forth.

3. In a tinner's stove having an opening for the soldering-irons in the front and an opening for the ash-pan in the side, the grate G, having its bars arranged transversely of the stove, or in line with the opening of the ash-pan, for the purpose of supporting and holding the soldering-irons in place, and at the same time facilitating the raking of the fire, substantially as set forth.

4. The ash-pan having its ends inclined, with the ledge *j* and projections *l*, to hold the door *k* in place, substantially as and for the purposes set forth.

5. The two-plate damper *r r′*, in combination with the double flue of a tinner's stove, substantially as described, for the purposes specified.

137,891.—*Horseshoe.*—MOSES C. CLARK, Manchester, N. H. Application filed February 3, 1873.

Claim.—1. Providing the common or ordinary horseshoe with a removable adjustable metal plate or pad, arranged between the two sides of the shoe, to support and protect the frog of a horse's foot, substantially as described.

2. In combination with the common horseshoe, a pad with two plates of metal, with India rubber or other cushion between the plates.

3. In combination with the metal plates or pads, two or more grooves in the inside corners of the heels of the shoe, to receive the edges of the plates, substantially as described.

137,892.—*Pigeon-Hole.*—CHARLES J. CLEMENTS and EDWIN P. FOWLER, New York, N. Y. Application filed March 12, 1873.

The partitions are united by means of a central grooved support of the same length as the partitions. A screw-rod passes through a hole in the center of the support and is fastened by a nut on one or each end. A washer is placed on each end of the rod before it is screwed up, and said washer has four points or teeth, one of which enters each of the four partitions. By unscrewing the desired number of rods both the lateral and the vertical sections or partitions may be removed.

Claim.—1. The sections B B, constructed to be used in combination with the support C, so that the sections, both vertical and lateral, may be removed as desired, substantially as and for the purpose specified.

2. The supports C, provided with grooves and central perforation *a*, for the purposes herein set forth.

3. The combination of the sections B, support C, and washer D with points or teeth *b*, and the whole united by a screw-rod and nut, substantially as and for the purposes herein set forth.

137,893.—*Corset.*—MORITZ COHN, New York, N. Y. Application filed January 30, 1873.

Claim.—A corset having the pockets for the reception of the bones formed in the weaving and varying in length relatively to each other, as desired, substantially in the manner and for the purpose set forth.

137,894.—*Plow.*—THOMAS L. COTTEN, Water Valley, Miss., assignor to MARTHA J. COTTEN, same place. Application filed January 29, 1873.

The subsoil-plow identical with applicant's patent of July 19, 1870, but having a saddle attached to the rear bar adjustable as to height, and arranged to carry a variety of shovels or plows.

Claim.—In combination with the device embraced in my patent of July 19, 1870, the slot and openings E in the standard D, saddle H, and bolts and nuts *c c* and A A, the whole being so constructed as to permit of the mold-board or blade being secured and adjusted substantially as described.

137,895.—*Fire-Extinguisher.*—GRITT A. COX, Jeffersonville, assignor of two-thirds his right to E. M. GARDNER, Bedford, Ind. Application filed December 14, 1872.

Secured to the two chambers by means of tubes is a mixing-chamber, divided by a diaphragm into two divisions. The diaphragm is secured to the upper part of the mixing-chamber and extends down half-way to prevent the union of the two liquids that may splash up from their respective chambers during transportation. Small air-tubes extend up into each chamber, which allow gas to escape upward so as to not interfere with the descending current of alkali through the connecting-tubes.

Claim.—1. The two holding-chambers A A′, in combination with the mixing-chamber D, when provided with the diaphragm E, the parts being arranged to operate substantially as set forth.

2. The combination of the chambers A A′ D D′, air-tubes B B′, tubes C C′, diaphragm E, and coupling F, when all are combined to operate substantially as shown.

137,896.—*Hobby-Horse.*—JESSE A. CRANDALL, Brooklyn, N. Y. Application filed January 30, 1873.

The seat is loosely hung upon crank-shaped levers, between two horse-like frames, the necks and tails of which, being pivoted, move with the swing of the seat. Reins attached to the neck-pieces assist the joint action of the whole.

Claim.—1. The frame A, when constructed with a circular socket for the reception of the circular lower end of a vibrating neck-piece, B, substantially in the manner herein shown and described.

2. The combination of the vibrating tails C C with the movable seat E, crank-rods *e*, and vibrating head and neck pieces B B, all arranged to operate substantially as herein described.

137,897.—*Shoe Pegging and Trimming Machine.*—ROBERT E. DRAPER, Enfield, N. C. Application filed December 12, 1872.

The vertically-moving carriage is slotted longitudinally that the follower may have free horizontal movement. The awl and driver are adjusted upon the lower end of a vertical stem which is attached to a standard rising from and supported by the follower. A knife is attached to the follower for trimming the edge of the sole as the pegging or nailing progresses. The shoe-carrier, by means of suitable mechanism, is enabled to present the entire outer surface of the sole to the action of the pegging mechanism.

Claim.—1. In a machine for pegging shoes, an up-and-down-moving carriage, B, containing a horizontally-reciprocating follower, C, to which the awl and the hammer or pegger are attached, whereby said implements are made to follow the contour of the sole of the shoe, as herein set forth.

2. The combination of the carriage B with projection *v*, follower C with projection and roller *w*, the springs *d d*, and the cam L, whereby the implements attached to the follower are moved up and down and back and forth at the proper times, for the purposes herein set forth.

3. The combination of the bevel-gears G H, shaft *l*, pinions *m n p*, and cogged shoe-carrier I, all constructed and arranged to operate substantially as and for the purposes herein set forth.

4. The combination of the bevel-gears G H, shaft *l*, pinions *m n p*, cogged shoe-carrier I with buttons *s s*, and the horizontal plane or table J having semicircular groove *r* and diametrical groove *t*, all substantially as and for the purposes herein set forth.

5. The combination of the stem K carrying the awl *z* and pegger *y*, the horizontally-reciprocating follower C, and the up-and-down-moving carriage B, all substantially as and for the purposes herein set forth.

6. The knife *f′* provided with a ball, *h′*, and attached to the follower C, substantially as and for the purposes herein set forth.

137,898.—*Loom.*—JOHN C. DUCKWORTH, Mount Carmel, Conn., assignor to himself, GEORGE DUCKWORTH, WILLIAM DUCKWORTH, and JAMES DUCKWORTH, assignors, by mesne assignments, to GEORGE CROMPTON, Worcester, Mass. Application filed February 15, 1867.

Claim.—1. In combination with the shifting shuttle-box rod and its lifting mechanism, the hook attached to said rod and the releasing-catch with its spring and connections, substantially as described, whereby the shuttle-boxes are lifted by a positive connection, which is disconnected whenever the shuttles or the boxes meet with obstruction to their upward movement to save breakage.

2. The arrangement of the double series of hooked jacks, in combination with the double lever or rocking arm, which gives motion to the stepped cam which controls the shuttle-boxes, said arrangement being and consisting of bringing the hooked ends of both series of jacks into line with each other, side by side below the pawl, so as to be operated by one pawl acting in one direction, substantially as hereinbefore described.

3. The combination and arrangement of the long upright side levers, one for each leaf of heddles and their respective leaves of heddles, with a series of hooked jacks attached to the upper part of the upper arms of said upright heddle-levers at one end of each jack, said jacks being arranged horizontally, or nearly so, and each jack having a hook on its upper edge and a hook on its lower

edge suitable to receive the knife or bevel edges of the reciprocating blades of the lifters and depressors, substantially as described.

4. In combination with said series of upright heddle-levers, one for each leaf of heddles hung in the middle at the side of the loom, and connected at each end with its leaf of heddles, the series of hooked jacks, constructed and arranged with respect to the levers as herein before described, and a pair of reciprocating knife or bevel edged blades, one above said jacks and the other below, and which move in opposite directions to each other in planes horizontal and parallel, or nearly so, for the purpose of lifting or depressing the heddles, the combination and arrangement being substantially as herein before described.

5. In combination with the leaves of heddles, long upright heddle-levers, and the hooked jacks, a pair of reciprocating parallel blades, commonly called lifters and depressors, when one of them is free to yield and move away from the other in case of obstruction by a jack getting caught between the blades, substantially as described.

6. The horizontal hooked jacks, when hinged to spurs or projections from the upper parts of the upper arms of the upright heddle-levers at the side of the loom, in combination with said heddle-levers and their respective heddles, substantially as described.

137,899.—*Torsion-Spring for Vehicles.*—RICHARD DUDLEY, Erie Pa. Application filed October 5, 1872.

The rocker-plates, which are confined in the curved cups, are grooved on top, that the springs may be kept in place. The bearings of the rocker-plates are so constructed, in combination with the cups, that the rocker may have lateral movement, which accommodates it to the surging of the vehicle and secures an easier motion.

Claim.—1. The curved cups B B and rocker-plates C C, so combined and arranged as to allow a lateral motion to the rocker in the cups and at its base, substantially as described.

2. The rocker-plates C C, having grooves *c c* on their convex heads, in combination with the lateral lever-arms A' A' of the spring, the whole being so arranged as to operate substantially as described.

137,900.—*Pen-and-Pencil Case.*—FREDERICK EGGELL, Buffalo, N. Y. Application filed October 7, 1872.

Rotating sleeves expose the names of the day and month through openings in a sleeve fixed upon the case, while the date of the month is exposed through an opening in a third sleeve.

Claim.—The stationary sleeve C having slots or opening *c*[1] and *c*[2], and secured to the pen-and-pencil holder A, as described, when combined with the sleeves *d d'* and B, substantially as and for the purpose shown.

137,901.—*Mold for Casting Molds.*—JOSIAH S. ELLIOTT, Chelsea, Mass., assignor to UNION STONE COMPANY. Application filed April 19, 1872.

Mold so constructed that a longitudinal half of the model can be reversed in the mold-frame and a complete mold made, in which articles can be cast.

Claim.—1. A mold for forming molds of soap-stone mixture or other similar material, in which the same model is used to form both faces of the soap-stone mold, substantially as specified.

2. The blocks A and D with their holes and pins, substantially as described, for the purpose specified.

3. The fac-simile or model *x*, arranged as described, in relation to the blocks D and A, so that it may be withdrawn from the soap-stone, substantially as and for the purpose described.

137,902.—*Wash-Boiler.*—WILLIAM EXNER, Harper's Ferry, W. Va. Application filed March 22, 1873.

A wash-boiler constructed with a closely-fitting conducting device to its ends and top, with openings at its end, with the opening at its bottom covered with side openings, and a valve under it to regulate the flow of water.

Claim.—The steam-washer, consisting of the casing A and the close-fitting current-washer D, having the tapering spouts E, with plane inner walls *a* extending entirely across the casing, the opening *a*, and the valve V, as described.

137,903.—*Welt-Edge Burnishing-Tool.*—MYRON J. FERREN, Stoneham, assignor to HENRY E. TOWNSEND, Boston, Mass. Application filed March 8, 1873.

A wheel with several arms, having peripheral grooves of varied form or size, is pivoted and clamped between two plates. A screw serves to tighten the plates or to loosen them, that the wheel may be held tightly in position or turned as required.

Claim.—1. A hand-tool for shaping and burnishing welt-edges, having the peripheral groove or grooves, substantially as shown and described.

2. In a tool for burnishing welt-edges, the adjustable wheel *f*, having the arms *h i k* with the respective grooves *o*.

137,904.—*Towel and Clothes Rack.*—LAUREN M. FITCH, Morrisville, N. Y. Application filed March 12, 1873.

A clothes rack constructed with the bar-holder in a single piece, with a back plate to attach it to the wall, with arms held by a wire connected with it and the arms having a slot, by which its end is passed under a detent, and when not in use to be dropped down out of the way.

Claim.—The plate A, made in one piece, with the back plate *a*, for attaching it to the wall, and the lugs *b*, the arms B having the slots *b* formed near their ends, all constructed and arranged as specified.

137,905.—*Gas-Burner.*—ELISHA FOOTE, Yonkers, N. Y. Application filed March 1, 1873.

Fitting, gas-tight, in each tip is a plug, through the center of which a deep orifice is formed for the issue of the gas. Above the plug is an expansion-chamber.

Claim.—1. A gas-burner composed of the several parts, and constructed substantially as shown, for the purposes specified.

2. The expansion-chamber A, constructed substantially as described, and with its center in the same straight line with the central line of the deep orifice.

3. The deep orifice B, when used in connection with a tube of larger size leading thereto and concentric therewith, as shown.

4. The several combinations hereinafter specified, to wit: First, the separate jets and deep orifices; second, the separate jets and the expansion-chambers, as above described; third, the separate jets, deep orifices, and expansion-chambers; and fourth, the deep orifices and expansion-chambers, all substantially as described.

137,906.—*Flour-Sieve.*—JOHN T. FOSTER, Jersey City, N. J., assignor to HARRY T. FOSTER and LUCIEN MILLS, same place. Application filed February 5, 1873.

Claim.—1. A flour sifter and strainer, consisting of a removable sieve, in combination with a bowl or dish so as to sift the flour into the bowl from the outside of the sieve instead of from the inside, as ordinarily, substantially as described.

2. The removable concave sieve A, having rings or hooks *a a*, in combination with the bowl B provided with pins *b b*, and bail C, substantially as shown, and for the purpose as set forth.

137,907.—*Reversible Cuff.*—LAVINIA H. FOY, New Haven, Conn. Application filed December 18, 1872.

Claim.—1. A reversible cuff, provided or made with one or more elongated slots or openings, *b*, for the insertion of the button, substantially as and for the purposes set forth.

2. The combination, with a reversible or other cuff, of a wedge-shaped slot, for the insertion of the button, as and for the purposes set forth.

3. The combination, with a reversible cuff, of a slot, *b*, for the insertion of the button, the edges of which are united in or near the center, substantially as and for the purposes set forth.

4. The combination, with a reversible cuff, of a slot, *b*, for the insertion of the button, the edges of which are united or connected at the center to form two wedged-shaped sections, substantially as shown in Fig. 4 of the accompanying drawing.

5. The combination, with a reversible cuff, of two slots, *b b*, for the insertion of the button, relatively arranged as shown in Fig. 5 of the accompanying drawing.

137,908.—*Screw-Wrench.*—DAVID FRANK, Allentown, Pa. Application filed March 21, 1873.

Two pinions are connected to the movable jaw and mesh into the teeth of each other and teeth arranged on the stationary jaw. When the pinions are in gear they are locked and hold the movable jaw in the desired position. They are thrown out of gear by means of a thumb-piece, and the movable jaw is then free to move.

Claim.—1. The combination, with the toothed shank A with jaw B, and the sliding case D with jaw E, of the stationary revolving pinion G and the movable revolving pinion G', as and for the purposes herein set forth.

2. The combination of the lever H, arms *d d* carrying the pinion G', and the spring I for moving the pinion G' up and down in the sliding case D, substantially as and for the purposes herein set forth.

137,909.—*Bed-Bottom.*—CAMILLE GENSE, Fouilloy, assignor to GUILLAUME PROSPER LANIER, Paris, France. Application filed March 21, 1873.

The slats are sustained by flat springs attached by flexible connections and fastened to a head and foot bar.

Claim.—A bed-bottom consisting of the longitudinal bars *i*, flat springs *f*, flexible connections *h*, and transverse stripe *j*, all combined as specified.

137,910.—*Railroad-Track Wrench.*—PIERRE L. GIBBS, Chicago, Ill. Application filed February 5, 1873.

Projections are formed on the interior of the circular socket A, whereby the wrench can be used for various-sized nuts.

Claim.—The circular socket A, furnished with the internal projections *a a*, substantially as and for the purpose specified.

137,911.—*Apparatus for the Manufacture of Starch.*—COLGATE GILBERT, Buffalo, N. Y. Application filed November 25, 1872.

Provides a series of adjustable supports, so that the table may always stand level, insuring a clear and uninterrupted flow of the liquids.

Claim.—In a starch-mill table or separator, the adjustable support C with the screw D and nut E, in combination with the timbers F or their equivalent, as and for the purpose hereinbefore fully set forth.

137,912.—*Starch-Mill.*—COLGATE GILBERT, Buffalo, N. Y. Application filed November 25, 1872.

The lead lining is set tightly around the stone and the metallic band put on hot, so that in cooling it will contract, forcing itself into the lead and clamping the lead against the stone. The lead lining covers the entire rim and gutter, preventing the escape of liquid.

Claim.—The lead (or its equivalent) lining *b*, arranged in and on the gutter C, and passing up between the band *a* and bed-stone A, as and for the purpose hereinbefore specified.

137,913.—*Bridle-Bit.*—CHARLES L. GINKINGER, Sterling, Ill. Application filed December 11, 1872.

The bit is cast in one piece with cheek-rings, by which the reins can be secured at varying distances from the horse's mouth to make a leverage.

Claim.—The "bar"-bit, having the mouth-piece B and loops C D E F, the whole being formed and arranged and constituting a single piece of casting, as and for the purposes set forth.

137,914.—*Carriage.*—LOUIS GLESENKAMP, Pittsburg, Pa., assignor of one-half his right to COLUMBUS WEST, same place. Application filed February 24, 1873.

The carriage presents a front protected by an extended top, the front having five sides in front of the door, in which glass may be placed.

Claim.—In close carriages, the pentagonal front, composed of the parts A, B, C, D, E, and F, in combination with the extended top H, substantially as and for the purpose set forth.

137,915.—*Plow.*—RICHARD B. GROUND, Edwardsville, assignor of one-half of his right to CHANCY G. SAUNDERS, assignor, by mesne assignments, to NELSON D. SWEENEY, Marine, Ill. Application filed June 27, 1872.

The axle of the wheel attachment is pivoted to the controlling-lever, and the plow is attached to said lever by a slotted connection, so that the plow may be adjusted in height to regulate the depth of cut.

Claim.—A plow in combination with the sulky attachment A F, clamp composed of the bolts *a b* and slotted plate *c c'*, slotted lever B *b'*, lock-lever E, elevated bar D, and perforated arc C, all the parts being constructed and arranged substantially as and for the purpose specified.

137,916.—*Torpedo for Oil-Wells.*—ALEXANDER HAMAR, Philadelphia, Pa. Application filed March 22, 1873.

Claim.—1. The combination, with a torpedo constructed and entirely closed, substantially as described, of the needle F, whereby the charge is ignited by perforating the cover of the fulminate-tube, as set forth.

2. In combination with the above, a spring for supporting the needle, substantially as described, for the purpose set forth.

137,917.—*Extension Table.*—EPHRAIM HAMBLOER, Detroit, Mich. Application filed February 8, 1873.

Each side of the table is provided with double leaves hinged together and supported by sliding extension supports, and a cross-brace is pivoted to the extension supports. One or both leaves may be raised.

Claim.—1. The extension bracket E, provided with leg F and brace G, for the purposes specified.

2. The arrangement of the table A with the leaves C D and bracket E, constructed and combined to operate substantially as and for the purposes described.

137,918.—*Corn-Husking Glove.*—PERRY N. HARTS, French Grove, Ill. Application filed October 24, 1872.

Metallic plates provided with rows of teeth are used on the thumb, fore and little fingers of the left hand, in connection with a common husking-pin in the right hand.

Claim.—The plate E having teeth *a*, plate G having teeth *g*, and plate H having the toothed pin A when secured to leathers, and arranged for operation on the left hand, in the manner substantially as and for the purpose specified.

137,919.—*Nut-Lock.*—MATHEW HAYS, Binghamton, N. Y. Application filed March 17, 1873.

A right and left hand thread is formed on the bolt. Two nuts are employed and turn in opposite directions. A rubber washer is placed between them and a pin passed through.

Claim.—The combination and arrangement of the bolt A and the nuts B and C, rubber washer E, and key-pin D, substantially as herein described and shown, for the purpose set forth.

137,920.—*Clamp for Paper-Cutting Machines.*—EZRA T. HAZELTINE and CHESTER PARK, Warren, Pa., assignors to RACHAEL DELIA HAZELTINE, same place. Application filed October 29, 1872.

Concave standards at either end of a table, screw threaded on their inner surfaces and placed opposite each other, forming parts of a circle, in which a combined screw and beveled gear engages, operating a clamp in an upward and downward motion.

Claim.—In a machine for cutting paper, the horizontal shaft *b* carrying the two bevel-wheels *c c*, and having its bearings in the journals *a a* rising from standards passing through and forming the axis of the combined bevel and worm wheels D D and carrying the clamp C, as set forth, said combined gear and worm wheels working in the segmental racks of the vertical standards B B B B, as shown, and all combined and arranged as and for the purpose specified.

137,921.—*Automatic Grain-Weigher.*—JOHN W. HILL, Dayton, Ohio. Application filed June 3, 1872.

From the short arm of the scale-beam of a grain-weigher is suspended an oscillating scale-pan divided into two compartments, which, in the process of weighing, are alternately brought into position to receive grain flowing from a stationary spout. When one compartment is filled the pan sinks, and in sinking lifts a latch, thus allowing the pan to tilt so that the grain will flow from the filled compartment and the empty one be brought directly under the spout. The sinking of the pan also works a valve to check the flow of grain from the spout until the weight is discharged from the filled compartment, and the pan rises with the other compartment, latched in position to receive its load.

Claim.—1. The combination of the oscillating pan hung upon the suspension-rods C C' of the beam of the balance, fixed catches on said pan, gravitating detents on the suspension-rods, and fixed brackets F, substantially as specified.

2. In combination with the foregoing elements, the stirrups *e'* and the shoulders *f*[2] on the catches, substantially as and for the purposes set forth.

137,922.—*Driving-Gear for Hand-Cars.*—JAMES D. HINCKLEY Adrian, Mich. Application filed November 13, 1872.

Two reverted cranks are secured to the spur-gear.

Claim.—The combination of the brakes G G' and levers H H' with the reverted cranks C C' and gear-wheel D, the wrist-pins of the cranks being secured to opposite faces of the gear-wheel, as described, for the purpose set forth.

137,923.—*Swage for Forming Horseshoes.*—DAVID F. HOFSTATTER and WILLIAM H. SHAW, New London, Ohio. Application filed February 12, 1873.

A block of metal having a flat base from which a square shank projects for insertion in the hardy-hole of the anvil, with a top, in part rounded and in part flat, the end of the swage adjoining the flat portion of its top being also rounded.

Claim.—The herein-described horseshoe swage, having a top transversely rounded or convex at A, flat at A[1], and a rounded or convex end, A[2], and the projecting shank B, substantially as and for the purpose specified.

137,924.—*Mechanical Movement.*—EUGENE C. HOPPING, Madison, N. J., assignor of one-half his right to E. A. ELY, same place. Application filed April 10, 1873.

Rotary motion of pawl-and-ratchet mechanism is transmitted to the pitman and connections with the cutter-bar, which receives a reciprocate motion.

Claim.—The combination, with a crank or rotary device, A, of pitman C, cross-head D sliding on fixed guides E, swiveling-pin F, connecting-rod G, bell-crank H turning on a fulcrum of an oscillatory support, I N, connecting-rod M, and a reciprocating device, K, carried upon the oscillatory support I N, substantially as and for the purpose specified.

137,925.—*Table-Leaf Support.*—HENRY IMHOF, Lockport, N. Y. Application filed November 29, 1872.

The fly is attached to a metallic yoke, having projecting arms for attachment to a board which is to be affixed to the frame of the table. The yoke has also a curved seat to receive the projection on the end of said board.

Claim.—In a table-leaf support, the yoke C formed with the arms *b b* and curved seat, and with pin or screw openings at right angles to each other, as set forth, in combination with the fly A and board D, having the projection *c*, all constructed as herein shown and described.

137,926.—*Harrow.*—DAVID L. JAQUES, Hudson, Mich. Application filed June 29, 1872.

A harrow constructed in the form of a triangle and provided with side bars, which are pivoted to the main bar by means of swivel-bolts, constructed with enlarged heads.

Claim.—The harrow tooth-bar C provided at its forward end with the swivel-bolt A, and furnished with an enlarged head, A', adapted to fit in a recess, *j*, formed in the bar A, substantially in the manner as set forth.

137,927.—*Breech-Loading Fire-Arm.*—ALPHONSE ETIENNE JARRE and PIERRE JOSEPH JARRE, Paris, France. Application filed July 20, 1872.

Fire-arm having a plurality of barrels or bores caused to traverse laterally on the movement of the hammers so as to bring the cartridges successively into position, and pivoted to a block having trunnions which work in grooves in the frame or stock, so that the barrels may be turned or folded away from the hammer and into a form convenient for being carried.

Claim.—1. The combination of the sliding block A and the stock, having an opening, C, adapted to receive the rear portion of the block, which projects from the said opening and beyond the end of the stock, as set forth.

2. The combination with the block A of the block B, pivoted to the block A, and having trunnions *b b'* adapted to recesses *r r'* in the stock, for the purpose set forth.

3. The block A, hung to a yoke, P, which is pivoted to a sliding and turning block, B, substantially as set forth.

4. The combination, with the stock of a fire-arm, of an automatically-sliding block, A, secured to the stock, substantially as described, so that, without being detached from the stock, the block may be turned to a position to expose the entire rear edge, as set forth.

137,928.—*Stove-Pipe.*—LOUIS JURGENS, Prescott, Wis. Application filed February 8, 1873.

The doors are provided on their inner surfaces with a depression, which fits within the orifice in the pipe.

Claim.—1. The door *a*, having the central depression *x*, in combination with a stove-pipe, as described, for the purpose set forth.

2. The arrangement of doors shown in Fig. 1, as and for the purpose set forth.

137,929.—*Grain-Drill.*—JOHN F. KELLER, Hagerstown, Md. Application filed February 27, 1873.

To change the drills from single to double ranks, they are attached alternately at their front ends to two lateral bars swinging on longitudinal axes, placed on one edge. On each there is a segmental pinion worked by a double-edged rack between them, this last being pivoted to a lever leading to the rear. This motion brings into a line or separates the points of attachment of the drills.

Claim.—The rocking bars D D provided with cogged segments, in combination with the double sliding rack-bar H and lever I and

the grooved metal standard J upon the frame A, as and for the purpose set forth.

137,930.—*Fish-Trap.*—CHARLES E. KETCHAM, Washington, D. C. Application filed February 25, 1873.

The ordinary pound-net has here an outside wire guard or fence to prevent its destruction by predaceous fishes, which bite at the gilled captives and cut the net into holes, through which the live fish escape.

Claim.—1. A protective wire screen or net, E, in connection with the ordinary net-pound A of a fish-trap, both being arranged with relation to each other in the manner and for the purpose specified.

2. The gate *f*, in combination with the mouth *a* of an ordinary fish-trap, and a protective wire screen or net, E, the whole being arranged and operated in the manner and for the purposes specified.

137,931.—*Potato-Digger.*—DAVID M. KING and GEORGE E. KING, Mantua Station, Ohio. Application filed February 4, 1873.

The share is supported on the rear end of a rectangular frame, which rests on bearing-wheels. A double set of fingers project rearwardly from the share, and are caused to vibrate in a vertical plane alternately by means of a set of cog-gears put in motion from the bearing-wheels.

Claim.—1. The cutter-stock C having the angle-piece *c'* combined with a standard, H, having the angular recess A^1, as and for the purpose specified.

2. The convex plate D applied to the teeth E and thin steel plate C to form a stop for the one and a stiffener for the other, as described.

3. The tooth E having end-threaded shank, the nut G, and the shaft F having notch *f* on front side, combined to form a rigid fastening that will also admit of ready removal, as set forth.

4. The two reversely and vertically moving sifters E F, applied directly in the rear of the shovels of a potato-digger, to operate as and for the purpose described.

5. The combination, with cutter-stock C and brace-stop D, of a standard, H, having the bearing-plate A, arranged in the manner described.

6. The standards H in a potato-digger, constructed with a concavity and a removable side, H', for receiving and protecting the arms J and rod K, in the manner set forth.

7. The vine-moving lever I' having the convex curve *p* applied on the standard H, as and for the purpose described.

8. The slotted standard H combined with clamp-screw pivot A^7 and clamp-bolt A^8, as and for the purpose set forth.

137,932.—*Machine for Boring Blind-Stiles.*—LEVERETT G. KIRKHAM, Derby, Conn. Application filed May 22, 1872.

An adjustable jointer is affixed to the bed which carries the boring-tools, and indicates the point at which the next hole is to be bored.

Claim.—In combination with one or more bits, E, and a support, I, to hold and present the stile to the bits, the stationary punch or pointer F adjusted relatively to the bit, substantially as and for the purpose specified.

137,933.—*Cultivator.*—JOHN M. KNOX, Rensselaer, Ind., assignor to himself and IRA C. KELLY, same place. Application filed August 6, 1872.

In the plows attached to any wheel-cultivator the standard enters a slight mortise in the under side of the beam, and is secured by links and clamp-hooks. Upright posts rise from the rear end of the beam and engage spring-levers extending backward from the cultivator-frame, for the purpose of regulating the depth of the plows, or by means of a spring-catch to hold them above the surface of the ground.

Claim.—1. The combination, with the beam G and standard G', of the saddles x^3 *y*, hook *x*, stirrup x^1, and links x^2 *z*, as described, for the purpose set forth.

2. The combination of the pivoted beam G with the post I, having the spring-catch, and the end bar J, as shown and described, for the purpose set forth.

137,934.—*Compound for Gas-Retorts.*—GEORGE F. KREISCHER and LUCIEN A. TARTIERE, New York, N. Y. Application filed March 28, 1873.

Ground fire-brick, clay, Teil hydraulic lime, carbon.

Claim.—A compound made of the ingredients herein described, and mixed together substantially as and about in the proportion herein set forth.

137,935.—*Compound for Preventing Incrustation in Steam-Boilers.*—JACOB J. LAVO, Wyandotte, Kans., assignor, by mesne assignments, to UNITED STATES CHEMICAL COMPOUND COMPANY, same place. Application filed August 23, 1872.

Claim.—The compound hereinbefore described, consisting of lye, oil, and sugar, when produced by boiling together the lye and oil to form a saponaceous liquid, and then adding the sugar, or its equivalent, in about the proportions specified.

137,936.—*Bed-Bug Trap for Bedsteads.*—CONSTANTINE LEGAL, Pittsburg, Pa. Application filed February 10, 1873.

To the head and foot boards of the bedstead are attached bifurcated upright standards, which are adjusted vertically by suitable screws. These uprights, at their tops, enter into holes in blocks which are adjustable horizontally on the under side of the cover, which is thus suspended over the entire bedstead. The cover has on its upper side suitable troughs to contain some liquid.

Claim.—1. The independent bifurcated uprights F F', slotted and adjustable on screws f^3, combined with cover D, foot-board a^2, and head-board a^3, as and for the purpose described.

2. The blocks E, having dovetailed grooves, and the tongued guide-pieces F' movable in ways G, combined with the cover D and uprights F, as and for the purpose set forth.

137,937.—*Shedding Mechanism for Looms.*—JOHN LOMAS, Kellyville, Pa. Application filed May 31, 1872.

The heddles are connected to vertical-sliding jacks, each having two shoulders on the opposite edges, against which the reciprocating knives or bars operate, one pair of shoulders being arranged for the shedding movement, the other for bringing the jacks into line. The actuating knives or bars are carried on sliding frames operated by duplex cams, arranged at right angles to each other, and the frames are connected by a strap over a loose pulley, so that the raising of one tends to lower the other. The pattern-cylinder is reversed by means of a vertically-sliding pawl, which is so connected with the driving-pawl that the latter is carried out of gear with the ratchet by the same movement of the workman which operates the former.

Claim.—1. The jacks having shoulder *h* h' *i* i', in combination with frames G G', and with the cams E E', arranged at right angles to each other, all operating as set forth.

2. The frames G G', operated directly by the cams E E', and maintained in contact therewith by means of the coupling-strap, or its equivalent, as described.

3. The combination, with the cylinder K and pawl Q, of the ratchet-wheel S, pawl R, and cords *t* and *u*, all arranged and operating substantially as and for the purpose set forth.

137,938.—*Smelling-Bottle Stopper.*—ENOS F. MARBLE and REUBEN W. GLIDDEN, Attleborough, Mass., assignors to WHITING MANUFACTURING COMPANY, New York, N. Y. Application filed January 15, 1873.

A perforated cap for smelling-bottles, consisting of a chambered top provided with a stopper, which may be withdrawn by unscrewing the cap without entirely removing it.

Claim.—A smelling-bottle provided with a perforated cap, *a*, containing a chamber, *c*, into which the odor is admitted by screwing the cap up without removing the same from the bottle, and which is closed by screwing the cap down.

137,939.—*Stone-Crusher.*—HENRY R. MARSDEN, Leeds, England, assignor to "THE BLAKE CRUSHER COMPANY" and ELI W. BLAKE, New Haven, Conn.—Case B. Application filed March 26, 1873.

The jaws are each provided with two sets of corrugations, the projections of the upper alternating with those of the lower, each jaw being constructed so that the projections of one fit into the depressions of the other. The lower set of corrugations will crush any pieces that escape through the upper.

Claim.—The faces of the jaws of a crushing-machine, constructed in two or more sections of corrugations, the sections being in the relative position to each other substantially as described.

137,940.—*Elevator.*—JOHN F. MARSH, Littleton, N. H. Application filed April 7, 1873.

At each landing is arranged an indicator, which is operated by the moving elevator, or its actuating device, to indicate the position of the elevator.

Claim.—The combination, with the elevator-car, of an indicating device or mechanism, substantially such as described, attached to some fixed or stationary part in the vicinity of the well or shaft in which the elevator-car moves, and connected with and operated by the elevator-car, or other moving part of the elevator apparatus, in the manner and by the means substantially as specified.

137,941.—*Device for Closing Bottles and other Vessels.*—JOHN MATTHEWS, New York, N. Y. Application filed April 10, 1873.

Claim.—1. The stem A, with smooth taper end *a*, and with or without the rings *b b*.

2. The combination of the rubber cap B and stem A, each of the form described and shown.

137,942.—*Corn-Sheller.*—ROBERT MCGRATH, La Fayette, Ind. Application filed July 8, 1872.

The sieves are so arranged under the sheller that the blast acts upon the whole surface of the sieve, and a sieve is arranged in a recess at bottom of the elevator for carrying up to regular sieves any grains blown over sieve.

Claim.—1. The combination and peculiar arrangement with the corn-sheller, consisting of the hopper *a*, toothed shaft *b*, and rod-cylinder *c*, of the sieves *k* and *l*, chutes *u* and *v*, plate *t*, and fan-blast *s*, substantially as herein set forth.

2. The arrangement of the perforated plate *o*, chute *p*, and recess *q* with the elevator *f*, as and for the purposes herein recited.

137,943.—*Window Frame and Sash.*—JOHN MCNAMEE, Philadelphia, Pa., assignor to himself and ENOCH W. CLOUD, same place. Application filed January 14, 1873.

The sash is suspended to the ends of the sash-cords by trunnions so as to be readily reversible. For this purpose the sash-stops are made retractable by means of eccentrics with arbors projecting from the casing, turned by keys.

Claim.—1. A window-sash suspended from or pivoted to the balancing-cords, in combination with adjustable ways at one or both sides of the frame, substantially as set forth.

2. The combination of the said adjustable ways with the eccentric spindles or equivalent device for operating the ways, as described.

3. The combination, substantially as described, of the trunnion *r*, secured to the sash, and having an enlarged outer end, with the plate *m* secured to the cord, and having a T-shaped slot adapted for the reception of the trunnion.

137,944.—*Apparatus for Heating Cranks.*—JAMES MILLER, New York, N. Y. Application filed February 17, 1873.

The cranks of large engines are placed in this box with their larger ends over a fire, and their smaller ends in another compartment, which is filled with water for keeping them cool; therefore only the larger ends become heated and expanded. The crank is then removed and fitted onto the shaft, where it becomes rigidly fastened by shrinking.

Claim.—1. The apparatus for warming cranks, when composed of a box, A, which contains the heating-apartment *b* and the cooling-compartment *d*, substantially as herein shown and described.

2. The metal frame C, applied, in connection with the apparatus for warming cranks, substantially as and for the purpose specified.

3. The chain D, arranged in combination with the crank to be heated and with a frame, C, and box A, substantially as set forth.

137,945.—*Nail-Extractor.*—DANIEL R. MORELAND and CLARK BLOCHER, Broad Ford, Pa. Application filed June 21, 1872.

The points of the jaws are made sharp to be driven into the wood around an embedded spike.

Claim.—The within-described nail and spike extractor, consisting of the handle A with jaw B and head *a'*, the pivoted jaw C with head *a*, and curved shank D with point *b*, all substantially as shown and described.

137,946.—*Combined Door-Plate and Letter-Chute.*—BERNARD MORNINGSTAR, Pittsburg, Pa. Application filed February 21, 1873.

A sliding chute fitted in an opening through the door, with its mouth covered by a door-plate hinged to its inner side, and both being jointly withdrawn before the plate is raised.

Claim.—The combination of the door-plate A A^1 A^2 A^3 *a a*, chute B B' *b b b' b'*, tube C, and bars D D, substantially as and for the purpose specified.

137,947.—*Thread-Cutter for Sewing-Machines.*—FRANCIS V. OBURG, Peoria, Ill. Application filed January 11, 1873.

The front plate of the head in which the needle slides is provided with a space and channel for receiving, and in which the shank of the cutting-blade is held when the front plate is in position.

Claim.—The front plate having the core-space *a*, with a downwardly-tapering channel, in combination with the knife B, having a downwardly-tapering shank, *c*, as specified.

137,948.—*Extension-Ladder.*—WILLIAM O'CONNOR, Berville, Mich. Application filed September 19, 1872.

In this ladder the extension may be above the platform or horizontally so as to form a staging.

Claim.—1. In combination with two ladders, A, the extension F, arranged as described, in order that it may be extended in any desired direction, substantially in the manner and for the purposes set forth.

2. The arrangement of the ladders A F, braces B G, adjustable feet C, and platform D, (the latter being provided with loops E and bolt *d*,) substantially as described, and for the purposes set forth.

137,949.—*Portable Fence.*—ALONZO W. OLDS, Green Oak Station, Mich. Application filed February 8, 1873.

The main post does not touch the ground, but is attached to an inclined sill which may be fixed at any angle to a transverse brace fastened to the upper part of the post. The rails may be held to this post by a batten, or may be secured thereto by other means.

Claim.—1. The combination of the sill A, brace B, posts C, and rails D, substantially as and for the purpose set forth.

2. The adjustable sills A, braces B, and the posts C, secured at their upper ends to the braces B, in combination with the ribs C' for fastening the rails D and preventing the wedging of the said rails and the lateral displacement of the posts C, as described.

137,950.—*Mortising-Machine.*—GEORGE F. OUTTEN, Norfolk, Va. Application filed March 18, 1873.

The mortising-tool, formed of steel plates, serrated on each edge, clamped together and held by a rod passing through their lower ends.

Claim.—The adjustable mortising-tool A, consisting of a series of blades, *a a*, serrated at each of their edges, and tapering in form from the middle, when the same are so constructed, arranged, and secured as to operate substantially as described.

137,951.—*Spring-Hinge.*—JOHN PALMER, Cincinnati, Ohio. Application filed September 24, 1872.

A wire spring is coiled around the pintle of an ordinary butt-hinge. The upper part of the pintle carries a pin which can be rotated over the teeth formed upon the upper surface of the hinge-eye. This pin and teeth serve as a pawl and ratchet to adjust the tension of the spring.

Claim.—The combination, in a spring-hinge, of the spring A, pintle B, stud *b* thereon, and ratchet-teeth *d* on one of the knuckles, to which the pintle is adjustably fastened, substantially as and for the purpose specified.

137,952.—*Machine for Cutting Leather.*—NAZARATH PAQUETTE, Summerfield, assignor of one-half his right to NELSON DAVIS, Ida, Mich. Application filed December 26, 1872.

The gage-bar is made adjustable. The shoe, upon the rear end of which the knife is supported, is beveled at its forward end, so that it will readily slide underneath the stock to be cut as the machine is moved forward, the stock being forced between two rolls up to the cutter.

Claim.—1. The guide-plate E, rollers H and J, shoe A, knife B, and gage-plate D, constructed and arranged as and for the purpose set forth.

2. The post G with its lever I and box *d*, in combination with the roller H, as and for the purpose set forth.

137,953.—*Steam-Generator.*—DAVID PARSELL, Saundersfoot, Wales. Application filed October 11, 1872.

A central main boiler is combined with a series of auxiliary boilers, and a side fuel-chamber with inclined bottom, and the main boiler with sloping grate-bars. Combined therewith is a heater and condenser, and a steam-drum over the whole, from which the steam is taken.

Claim.—1. The combination of the main boiler D with the series E F G and fuel-chamber A, as described.

2. In combination with the elements of the first claim, the heater H.

3. The generator described, consisting of furnace C, fuel-chamber A, the boilers D E F G, heater H, and condenser K, all combined and arranged as described, for the purpose set forth.

137,954.—*Clasp for Harness.*—MARTIN A. PENN, Washington, D. C. Application filed March 1, 1873.

A metallic clasp surrounding the ends of straps, and held in place by a slotted-head screw and nut.

Claim.—1. In bridles or harness, the within-described adjustable screw-rivet, consisting of the screw A provided with the slotted head *a*, and the thumb-screw B, substantially as and for the purpose shown.

2. In a harness halter or bridle, the combination of a slotted strap, S, with the slides C and adjustable screw-rivets B, substantially as and for the purposes herein set forth.

3. The combination of the swinging brow-band D, the slotted neck-strap E, and the screw-rivet rosette B', substantially as and for the purpose shown.

137,955.—*Folly.*—WILLIAM L. PERRY and ADONIRAM J. MATHEWS, Hartwell, Ga. Application filed November 30, 1872.

Claim.—The dovetail projections *a a* on the ends of the folly-sections A, in combination with the metal socket B having dovetail recesses at its ends to receive the projections *a a*, the wings *g g*, and spoke C, formed with a shoulder, *c*, the tire D, and the bolts E E, the whole being arranged, in relation with each other, as shown and described.

137,956.—*Bolt and Rod Cutter.*—SYLVESTER H. PERSTON, Worth, Pa. Application filed March 25, 1873.

A cutter is secured to the stationary arm by a bolt and flange. The lever is pivoted eccentrically, and is provided with an adjustable elbow-brace, which forms a stop to its movement.

Claim.—1. In combination with a bolt-cutter, the adjustable elbow-brace D, forming the stop E, substantially as and for the purposes herein set forth.

2. The lever A, provided with the flange *b*, aperture *c*, and stationary cutter C, in combination with the lever B pivoted eccentrically to the lever A, and its upper end forming the movable cutter D, all constructed and arranged substantially as and for the purposes herein set forth.

137,957.—*Tire-Tightener.*—WILLIAM D. G. QUIGLEY, Spring Valley, N. Y. Application filed October 19, 1872.

The jaws have grooves in which a hinged staple closes into an open-ended latch, and is held in position by a set-screw and nuts. The jaws and pads have grooved and flanged screws, into which are placed leather or other plates to adapt the device to spokes and fellies of different sizes.

Claim.—1. In apparatus for tightening the tires of carriage-wheels by forcing the fellies outward, the combination of the jaws A A having groove *u*, the staple B having hinge *x*, and the latch C having one open end, constructed and arranged substantially as specified.

2. In a tire-tightening machine, recessed jaws A having flanges or grooves *s* adapted to receive plates *y* of different thicknesses, substantially as and for the purpose herein set forth.

3. In a tire-tightening machine, the recessed pads G, constructed with holding-flanges, as described, and adapted to hold plates *f* of different thicknesses, substantially as and for the purpose specified.

137,958.—*Coffin-Handle.*—JAMES S. RAY, East Haddam, Conn. Application filed March 24, 1873.

A spring is secured in the socket, and serves, by resting against the ends of the handle-levers, to retain the handle in an elevated position. A slight push enables the ends to pass the spring and the handle to fall.

Claim.—The spring-rod D, secured transversely in the socket A, in combination with the pivoted arm B, substantially as and for the purpose herein shown and described.

137,959.—*Cotton-Cultivator.*—CORNELIUS F. REAMS, Raleigh, N. C. Application filed April 4, 1873.

A rectangular frame has within its sides two bearing-wheels, one of which is provided with cog-gears, which give motion to the revolving chopper. The forward barring-off plows, as well as the scrapers which return the soil to the roots of the plants after the chopper has thinned them out, are adjustable laterally.

Claim.—The bearing-wheels G G, arranged between the side frames A A and directly in rear of the adjustable scrapers P P, for the object specified, for operation in connection with shaft K,

pinion I, hoes L, and the rear hilling plows or wings S S, all arranged substantially as herein shown and described.

137,960.—*Towel-Rack.*—JOHN REARDEN, Brooklyn, N. Y., assignor to SAMUEL W. FOWLER, same place. Application filed March 17, 1873.

A towel-rack constructed with two uprights crossed at their center and pivoted with pieces across both ends, one for legs or supports, the other or upper one for the attachment of cords to control the form of it and hold the article to be exposed or dried.

Claim.—The towel-rack composed of the cross-bars A B, provided with suitable feet, the cross-heads C C, and flexible connections D D, substantially as herein described.

137,961.—*Baker's Oven.*—CHARLES ROBBINS, Charlestown, Mass., assignor to himself and JEROME A. ROBBINS, same place. Application filed February 27, 1873.

The products of combustion pass from the rear of the fire-chamber to the flue at the front; thence upwardly to the top, and through the top flue to the rear; thence downwardly at the rear to the entrance of the flue beneath; thence through this flue to the diving-flue at the corner, and through this corner-flue to the exit-flue at the bottom.

Claim.—1. In combination with the fire-pot and oven, located as described, the flues *u u*, extending from the fire-pot to the front flues *r r*.

2. The vertical escape-flues *s s* and bottom flue *t*, at the front of the structure, and arranged, with respect to the oven and fire-pot, substantially as shown and described.

3. The general arrangement and location of the fire-pot *a*, oven-flues *u u*, flue-chambers *i i*, vertical rear flues *v v*, and vertical front flues *r r*, substantially as shown and described.

137,962.—*Oil-Cloth-Printing Machine.*—CHARLES ROMMEL, Elizabeth, N. J., assignor to himself and WIENER H. TOWNSEND, New York, N. Y. Application filed March 8, 1873.

Coloring-rollers are arranged with boxes in a spider-frame in such manner that the requisite number of printing-blocks are successively colored, and the cloth is carried forward as soon as the printing of the blocks is completed. Shaft of printing-roller is connected, by pawl-and-ratchet arrangements, with the printing-bed and movable frame, which regulate the forward movement of the cloth and the return of the supporting-frame at the required time.

Claim.—1. The spider-frame D having arms *h* and slots *i*, in connection with ratchet-wheels *g*, pawls *f*, arms *e*, and wheels *d*, producing motion of frame D, substantially as set forth.

2. Coloring-rollers C, having mutilated pinions *r* and weighted boxes *q*, in connection with segments *t*, guide-pieces *m*, and springs *n*, for coloring printing-blocks, as described.

3. The connection of lever O and lug *p* of printing-roller B with pawl *f* to keep spider-frame D at rest for passage of finishing-block, as set forth.

4. The table-motion, produced by eccentrics *s*, pawls *t*, ratchet *u* and *u*¹, in connection with cloth-rollers F and F′ and movable frame G, substantially as described.

5. Eccentric cylinders H and H′, guiding clamp-levers *v* and *v*′, in connection with ratchet-wheels *u*² and *u*³, pawls *w*, frame G, and bed E to feed cloth, as set forth.

6. The combination of the parts of the foregoing clauses with printing-roller B and frame A, substantially as and for the purposes described.

137,963.—*Road-Wagon.*—CYRUS W. SALADEE, St. Catharine's, Canada. Application filed March 31, 1873.

The wagon-body is secured to the rear axle and front bolster. An independent spring-bottom is arranged within the body. The wagon-seat, having its front, bottom, and back made from one continuous strip of spring-steel, is secured to side springs, these springs being suspended outside of the body, and their ends have bearings upon links, which are secured to the under side of the wagon-body.

Claim.—1. In combination with road-wagon bodies A, the spring-bottom R, substantially as and for the purpose set forth.

2. The body A, having its rear end rigidly secured to the hind axle E, and the front end to the bolster F, thereby dispensing with perches, in combination with the seat J rigidly secured to the spring B suspended outside of the body A, substantially as and for the purpose set forth.

3. The links and bearings C D, with or without the connecting-rods C′, by which to secure and operate one or both ends of the springs B to the under side of the body A, all combined substantially as and for the purpose set forth.

4. In combination with a road-wagon wherein the seat-risers are secured to the side springs, the seat J, the front, bottom, and back of the end frames, made of a single strip of spring-steel or other equivalent material, constructed substantially as and for the purpose set forth.

137,964.—*Gas-Burner.*—IRA W. SEALER, Brooklyn, N. Y. Application filed February 5, 1873.

Longitudinal apertures are cut in the tip at right angles to the flame-slot. The inclination of the auxiliary flames to the burner is regulated by an adjustable collar moving upon the pillar.

Claim.—The pillar *a*, having adjustable collar *c*, in combination with the tip *b*, provided with the aperture *c*, substantially as shown and described.

137,965.—*Combined Seed-Separator and Drill.*—PARKINSON DODGE SHEPHERD, Telfair, Ga. Application filed April 12, 1873.

Devices for separating cockle, &c., from grain placed in hopper of drill.

Claim.—The combination, with the hopper and discharge-spouts of a grain-drill, of the cockle-seed attachment described, consisting essentially of the rollers, brushes, and chutes, arranged substantially as described, for the purpose set forth.

137,966.—*Mode of Forming Turned Seams.*—SAMUEL W. SHOREY Boston, Mass. Application filed March 5, 1873.

The edges of the material are first united by the wire staples of Shorey's patent No. 131,306, and then turned down upon them to flatten the seam.

Claim.—The improved mode of forming turned seams, consisting in uniting the edges by the staples, and turning and pressing the adjacent leather down upon said staples, substantially as shown and described.

137,967.—*Dress-Pattern.*—ELIZABETH P. SMITH, Chicago, Ill. Application filed February 10, 1873.

The larger pattern has different scales marked upon it, having figures, each with a corresponding perforation through which to mark the fabric according to the different measurements. The smaller pattern serves as a guide in drawing the lines between the dots thus made, by which the proper outline is obtained for cutting.

Claim.—The patterns for forming both the front and back of dress-waists arranged upon two separate sheets, with the scales and figures marked thereon, substantially as shown and described.

137,968.—*Revolving Fire-Arm.*—ORIS A. SMITH, Middlefield, Conn. Application filed September 27, 1872.

Combination of hammer having arranged therein a spring-stud, lever-catch, and cylinder, whereby the cylinder is locked in position and unlocked to allow it to be revolved as required. Also, combination of pintle arranged and operated by a spring to retain said pintle within the cylinder, and a bolt in the frame operated by a comparatively strong spring, which forces the bolt into the front end, and, thereby, the pintle from the rear end of the cylinder, whereby the same is conveniently removed from and replaced within the frame, as may be required.

Claim.—1. In combination with the hammer D and cylinder C, the lever E F and the stud *d* upon the hammer, operating together to release and lock the cylinder, substantially as set forth.

2. In combination with the cylinder C and its frame, the pintle *n* axially within the cylinder, and the bolt *s* in the frame, the said bolt and pintle together forming the axis upon which the cylinder turns, substantially as set forth.

137,969.—*Deodorizing Animal Matters for Fertilizers, &c.*—EDWARD C. C. STANFORD, Glasgow, Scotland. Application filed March 22, 1873.

Claim.—The process herein described of deodorizing solid or liquid matters by subjecting the same to the action of granulated charcoal, either alone or mixed with earthy matter, as described, the charcoal being afterward recovered and revivified for successive uses in the manner herein shown, for the purpose specified.

137,970.—*Cement-Lined Pipe.*—MELVIN STEPHENS, Brooklyn, N. Y. Application filed October 29, 1872.

Each section provided with concave and convex end, permitting a curved line of pipe being laid. Metal extends over convex end to interior to protect edge of cement lining. Strengthened at ends by a metallic ring applied edgewise.

Claim.—1. The sheet-metal cylinder *a*, lined with cement and provided with a short taper or cone, *c*, at one end, the sheet metal covering the taper or cone of the lining and extending to the inner surface, or nearly so, of the lining, substantially as and for the purpose set forth.

2. The thin metallic ring A applied edgewise to and combined with the metallic tube of the cement-lined pipe, for the purposes set forth.

137,971.—*Automatic Gate.*—GEORGE B. STEVENSON, Upper Sandusky, Ohio. Application filed January 25, 1873.

A bracket on the fixed post holds a perpendicular rod, on which one end of a bell-crank is pivoted, the operating rod or wire being pivoted centrally on said crank, and a pintle descending into the other end of said crank from a plate which shelters all these parts, and being bent at right angles is secured to the end of the gate below the crank-hinge.

Claim.—The elbow-lever H turning on the pivot h^3 attached to the plate I hung on the post D, with its front end perforated to receive the pintle i, which is attached to the corner of the plate J on the gate-post, and a pin, h^4, to engage with the rod F, substantially as shown, and for the purpose specified.

137,972.—*Gate-Hinge.*—JOHN H. STONE, Chapel Hill, Tex. Application filed March 10, 1873.

A comparatively strong and heavy bar swings at its inner end upon the pintle of the hinge. A rectangular strap forming three sides of a square is pivoted by a bolt to the outer end of the bar, and has its free end provided with a slot which allows it to pass over the inner end of the bar. This strap is turned outward, passed around the gate-post, and then bolted firmly to the inner end of the bar. Thus a gate may be hung or unshipped without cutting into the post with screws or bolts, and by simply unkeying the strap and passing it around the post.

Claim.—The combination of the bar A with the strap G having notches in its ends to receive said bar, the curled forks E F, the latter extending across and outside of the bar A, the pivot D, and removable pin G′, substantially as and for the purpose described.

137,973.—*Wood Pavement.*—HENRY M. STOW, San Francisco, Cal. Application filed December 13, 1872.

The spaces between the blocks are much narrower than usual in wood pavements, being formed by the interposition of strips of roofing-paper or small cords just sufficient to give elasticity under expansion and contraction from the weather. Coal-tar is applied in the usual manner.

Claim.—1. The method herein described of constructing wood pavements by interposing small cords or strips of paper between the rows of blocks for the purpose of forming narrow spaces between said rows, substantially as herein described.

2. A pavement composed of rectangular blocks separated by paper or cord, the same remaining and forming a part of the pavement, and the spaces filled with coal-tar, pitch, or some suitable cement, substantially as described.

137,974.—*Bread-Raising Apparatus.*—JOHN SUTTON, New York, N. Y. Application filed February 17, 1873.

Near the upper part of the case or chest is a rack for the reception of the pans of dough; under this a water-heater or pan, under which is arranged a lamp with an air-heater over it to concentrate the heat under the water-pan. Pipes are also used to convey the heat above the water-pan.

Claim.—1. The water-heater I, arranged above and in combination with the air-heater G and lamp F, and beneath the pan-support D, substantially as described.

2. The pipes *g*, extending from below through the heater and water-chamber and through the floor C, supporting the latter for operation, substantially as described.

137,975.—*Wheel-Plow.*—WILLIAM P. SWEENY, Marine, Ill. Application filed September 27, 1873.

On the release of the lever the plow is lifted from the ground by the forward progression.

Claim.—The beam of a wheel-plow in combination with caster-wheel A, lever B, a locking-latch attached to the lever, and a fixed notched arc, C′ *c*′, all arranged and operating substantially in the manner and for the purpose specified.

137,976.—*Dome for Stoves.*—AMMON TAYLOR, Newtown, Conn., assignor of one-half his right to HENRY G. CURTIS, same place. Application filed February 12, 1873.

Claim.—The herein-described dome, constructed to be set on and cover the openings in the top of a stove, when provided with the glazed openings E, substantially as set forth.

137,977.—*Railroad-Car Axle.*—THOMAS C. THEAKER, New York, N. Y. Application filed April 3, 1873.

The inner end of one of the divided axles is conical in form, and rotates within a socket formed as a part of its fellow axle, the two being secured by means of a ring and keeper. A collar is formed on one of the axles, and by transferring a washer from one side to the other of the collar the axle may be extended, if desired; the bearings also may be lengthened by means of a washer having a stop which engages in a groove in the axle, the washer being adjusted by an outside nut.

Claim.—1. A compound axle composed of two parts, one inserted in a tubular portion of the other so as to be capable of independent rotation therein, in combination with collar *b*, screw-cap *c*, and keeper *d*, constructed and arranged to operate substantially as described.

2. The compound axle composed of two parts, A and B, the part A being forged in one solid piece, with a tubular portion conical in form, except the two cylindrical ends, which constitute the bearings of the part B when inserted therein, and the said part B of corresponding form, fitting into the tubular portion of A, and the said two parts capable of rotating independently of each other, substantially as set forth.

3. In combination with a compound axle composed of two parts, one fitting within a tubular portion of the other and capable of independent rotation therein, the collar *b*, screw-cap *c* with its notches *i*′, and the clutch or keeper *d* with its tooth or teeth *i* and screw *j*, all constructed and arranged to operate substantially as described.

4. In combination with a compound axle composed of two parts, one fitting within the other, the collar *b*, screw-cap *c*, and the transferable washer *f*, to increase or diminish the extension of the axle by transferring it from one side to the other of said collar, substantially as described.

5. In combination with an extensible axle, the washer *g* with its internally-projecting tooth or stop, (fitting into a groove in the axle,) or equivalent devices to prevent said washer from turning, and the screw-nut *n* to extend or contract the journals to correspond with an extension or contraction of the axle, substantially as described.

137,978.—*Crosscut-Saw Handle.*—WILLIAM E. TRAVIS, Ypsilanti, Mich. Application filed February 18, 1873.

The clamp in which the saw is secured may be adjusted so that it will be in the same vertical line with the handle or form a right angle therewith.

Claim.—1. A detachable saw handle or tang, made so as to be adjustable, as described, to enable the operator to use the saw in different positions, substantially as set forth.

2. A detachable and adjustable handle or tang for crosscut-saws, wherein the handle A, nut B, coupling-bolt E, ferrule D, and jaw or clamp C are constructed and arranged to operate substantially as and for the purposes specified.

137,979.—*Stock for Millstone-Picks.*—FULLER TRUMP, Springfield, Ohio. Application filed March 8, 1873.

Claim.—1. A stock for securing the bit of a mill-pick consisting of a part, B, fixed to the handle, and a sliding part, C, bearing against the other face of the bit, said parts being respectively fitted with opposed inclined surfaces by which the parts are held in position griping the bit, substantially in the manner set forth.

2. The sliding piece C constructed with a projection, C′, to embrace the end of the bit, used in combination with the part B fixed to the handle; said parts being respectively formed with opposed inclined faces so as to compress the bit with a pressure due to the momentum of the handle and part B attached thereto, substantially as set forth.

3. The part B constructed with a recess to receive the bit on the surface at the bottom of the recess, and with overhanging lugs in combination with the movable part pressing the bit against the base of the recess by the action of opposed inclined surfaces, substantially in the manner set forth.

137,980.—*Combined Hanging-Basket and Bird-Cage.*—SAMUEL VANSTONE, Providence, R. I. Application filed March 24, 1873.

A bird-house constructed in the form of a cone provided with a door and ventilators; beneath the house is suspended a basket by means of wire hangers secured to the side of the house under the eaves, and beneath the basket is secured a pan for receiving the drip from the basket.

Claim.—The combination of the bird house or cage A, the basket B, and the pan C, the whole arranged in the manner substantially as described, for the purpose specified.

137,981.—*Faucet.*—HENRY VARWIG, Cincinnati, Ohio. Application filed August 20, 1872.

Improvement on Patent 116,396. A cap with a bayonet-joint replaces a screw-cap covering a spring-chamber in a ventidact.

Claim.—The combination of the detachable cap G′ with the valve-chamber G *g*, when the former is provided with the right-angular slots S S′ *s s*′, and the latter with the studs R R′, all constructed and arranged for operation as and for the purpose set forth.

137,982.—*Sad-Iron.*—JOHN J. VAUGHN and CHARLES J. BLANEY, Boston, Mass. Application filed March 29, 1873.

A sad-iron in ordinary form with a slot or mortise in its upper center, the handle attached to a sliding plate with a dovetailed tenon fitted to the slot, with a stop or detent on the point of the iron, and a spring in the back end to hold it in position.

Claim.—A sad-iron consisting of the base-section A having the tapering recess *a* and solid point B, and the handle-section C having the spring-catch *k* and tongue *e* tapering laterally from heel to front, and vertically in the opposite direction, substantially as specified.

137,983.—*Sewing-Machine Stand.*—RICHARD M. WANZER, Hamilton, Canada. Application filed January 13, 1873.

The machine is attached to a slab or weighted base, adapted for insertion in a recess formed in or on a table. The base is weighted so that the machine can be used as a hand-machine on any other table without fastening said machine thereto.

Claim.—The slab or weighted base C, carrying the operative mechanism A of a sewing-machine, and adapted for insertion into a recess, D, formed in or on the table B, as and for the purpose herein set forth.

137,984.—*Die-Rolling Machine.*—HERVEY WATERS, Northbridge, Mass. Application filed December 6, 1864.

The combination specified in the claim, and seen for the most part in the drawing, is designed to secure accurate matching of the revolving dies.

Claim.—The combination of the bed-piece A, housings *b b c c*, rolls *d d*, driving-gear *e*, driving-shaft *g*, driving-pinions *h h*, connecting-gears *i i*, and fast and adjustable boxes, when constructed and arranged substantially as shown and described.

137,985.—*Corset.*—AARON MOSES WEBER, Oshkosh, Wis. Application filed March 11, 1873.

Claim.—A corset closed at the back and open at the front or sides for lacing the same, and provided with the series of bones A, placed close together and running from top to bottom, and with or without the series of inclined bones A′, all arranged substantially as and for the purpose described.

137,986.—*Piston-Valve for Steam-Engines.*—GEORGE M. WEINMAN, Columbus, Ohio. Application filed January 21, 1873.

A main piston-valve has a chamber in its central portion, into which the steam is admitted and conducted by annular ports into the cylinder. A central exhaust-port is arranged in the lower side of the valve. Combined with the main valve is an auxiliary oscillating balanced cut-off valve operated by an arm and connecting-rod, and with suitable ports for reversing the main piston-valve.

Claim.—1. The valve D, when constructed in the form of a cylinder, and having in its central portion a chamber, into which the steam is admitted and from which it passes to the annular induction-ports F F, it also being provided with an exhaust-port, E, for the escape of steam from the cylinder.

2. The auxiliary valve C, when constructed with a beveled end and with steam-passages, substantially as and for the purpose set forth.

3. The combination and arrangement of the auxiliary valve C, the steam-induction ports B^1 B^1 B^4 B^4, and exhaust-ports B^2, substantially as and for the purpose set forth.

4. The combination of the cylindrical main valve D, auxiliary oscillating valve G, and steam-chest A, the parts being constructed and arranged substantially as and for the purpose set forth.

137,987.—*Revolving Horse-Rake.*—WILLIAM WELLS, Salem, Mass., assignor of one-half his right to ENOCH P. FULLER, same place. Application filed January 22, 1873.

A revolving rake, in two sections, is attached to and in rear of an axle by pivoting-rods, and operated by a system of levers,

the rear ends of which are pivoted to teeth eccentric to the rake-head.

Claim.—The rake-head *h*, suspended from the carriage A by the rods *l*, in combination with the rods *m* connected to the rake-teeth, as shown, the crank-arms *o*, angular arms *s*, and lever *q*, all constructed and arranged to operate substantially as described.

137,988.—*Gauntlet-Glove.*—ISAAC B. WHIPPLE, Gloversville, N. Y. Application filed February 21, 1873.

A purse or pocket on the gauntlet of a glove.

Claim.—A gauntlet-glove having a safety-pocket, B, formed on the outer surface of the wrist-piece or cuff, and upon the under or palm side thereof, the mouth of said pocket being provided with a suitable fastening device, all constructed substantially as and for the purpose set forth.

137,989.—*Swivel-Loop for Fire-Arms.*—ELI WHITNEY, JR., New Haven, Conn., assignor to THE WHITNEY ARMS COMPANY, same place. Application filed March 26, 1873.

Indicated by claim.

Claim.—The herein-described swivel-loop, consisting of the loop B, one end of which is headed, combined with the sleeve *b*, and secured into the lug against the said headed end, substantially as set forth.

137,990.—*Single-Tree for Horse-Cars.*—JOHN WILLS, Rock Island, Ill. Application filed March 25, 1873.

The single-tree is provided with a hook on which is a projection at right angle with the shaft. By turning the single-tree partly around this projection enters a corresponding slot in the draw-bar, and, being turned into place for service, is securely locked therein.

Claim.—The single-tree C provided with the hook D *d*, in combination with the pivoted bar B provided with opening *a b*, substantially as and for the purposes herein set forth.

137,991.—*Sheet-Metal Tubing.*—SAMUEL R. WILMOT, Bridgeport, Conn. Application filed March 1, 1873.

A peculiarity of this lock-seamed tubing, besides that of having been drawn through dies, is that the seam is drawn and consolidated in the direction of its folds as well as in that of its thickness.

Claim.—As an improved manufacture, lock-seamed, drawn, sheet-metal tubing, with joint or seam consolidated, and metal condensed, hardened, stiffened, and smoothed, as herein described, as results from drawing through a die or dies that impinge against, compress, consolidate, and draw upon all the exposed surfaces of the joint or seam and of the tube.

137,992.—*Manufacture of Sheet-Metal Tubing.*—SAMUEL R. WILMOT, Bridgeport, Conn. Application filed March 1, 1873.

An internal former and an external shell of corresponding shape separated by a space equal to the thickness of the metal, the shell abutting against a steel block having, in continuation of the shell, a smooth, tapered, but in cross-section cylindrical, hole; the former, at the end lying within the shell, being of like taper and cylindricity, but having also grooves converging into one, of peculiar shape, that bring the two edges of the metal together and force them to interlock; and, also, a terminal section that, with the walls of the hole at its smallest diameter, constitute a draw-die, that, besides drawing the tube in the manner common to other draw-dies, compresses and draws upon the seam in the direction of fold as well as in the direction of thickness.

Claim.—1. As an improvement in the art of manufacturing tubing of sheet-metal strips or skelps with interlocked joint or seam, the method of condensing and consolidating the joint or seam, and also the metal of the tube proper, by drawing the same through a die or dies that impinge against, compress, consolidate, and draw upon, all the exposed surfaces of the joint or seam, and of the tube itself, substantially as described.

2. An improved machine constructed, substantially as described, of formers, dies, and guides, organized so that as a strip of metal is drawn therethrough or between the same, to bend said strip into a tubular form, to turn its edges to interlock one with another, to close the seam thus produced, and to die-draw such locked-seam tube by pressure applied in every direction both to the seam and body of the tube circumferentially, inside and out.

3. The combination of the male former E and its overhanging plate or portion d with the female former F, and the tapering circular closing die H with its tapering core or extension of the male former E, essentially as herein set forth.

4. The combination with the tapering die H of the tapering section or portion *f*, having grooves *r r'* arranged to converge in a forwardly direction, substantially as specified.

5. The grooved tongue *n*, wing *w*, and jog *u*, in combination with the groove *o* in the section or portion A of the core, and the closing die H, essentially as described.

6. The combination, with the elements recited in the last preceding clause of claim, of the drawing-die I and its grooved core *k*, substantially as specified.

7. The sectionally-constructed core or core extension, composed of detachable sections *f*, *g*, *h*, *i*, and *k*, arranged in relation with each other and with the dies H I, essentially as described.

8. The detachable male former E, with its attached core or forward extension, in combination with a stop, *e*, arranged to resist the draft on said former E relatively to the tapering die H, substantially as specified.

137,993.—*Fire-Place Grate.*—JAMES M. WOODCOCK, Bridgeport, Ohio. Application filed February 7, 1873.

The lever G serves to agitate the grate-back both vertically and horizontally and to vibrate it. The lever E moves the grate-bottom horizontally, vibrates it, dumps it, and also, in connection with a pin, locks it in position.

Claim.—1. The inclined independent grate-back E provided with journals f^2 and combined with oblong slots *b* in bearing-bracket I or jambs B', as that the grate-back may be moved in a vertical or a horizontal direction, as and for the purpose specified.

2. The pivoted grate-back F, supported on oblong slots *b*, and provided with the pendent tenoned arm f^2, in combination with the lever G and fulcrum-bearing H, as and for the purpose specified.

3. The pivoted and laterally-movable grate-bottom D, provided at one end with pendent pin d^2, in combination with the lever E, fulcrum-bearing *c*, and side pin e^2, as and for the purpose specified.

4. The fire-place grate herein described, consisting essentially of the inclined pivoted fire-back F, the pivoted grate-bottom D, front C, and independent jambs B' or bearing-brackets I, combined and arranged as and for the purpose specified.

137,994.—*Bolt for Doors, &c.*—JOHN S. R. WRIGHT, Nichols, N. Y. Application filed October 19, 1872.

A vertical bolt, extending the whole length of the door, is pivoted at its lower end to an eccentric or cam lever; this elbowed lever is pivoted to the door near the bottom, and is furnished with a long handle, which, when lowered, projects the bolt upward, while the elbow part, pressing against a plate on the door-frame, relieves the strain upon the hinges, thus preventing sagging. A pin limits the movement of the lever when raised, and there is also provided a flanged plate to secure the door from being pried open at the bottom.

Claim.—1. The vertical bolt C and eccentric elbow-lever E attached to the door B, substantially as specified.

2. The flanged plate a^1, in combination with the eccentric elbow-lever E, door B, frame A, and bolt C, substantially as specified.

137,995.—*Jelly Glass.*—THEODOR A. ZELLERS, East Birmingham, Pa., assignor to THOMAS B. ATTERBURY and WILLIAM DOYLE. Application filed June 27, 1870.

The mouth of the glass is formed with a recess on the inside for supporting the cover, and a small part of the vertical rim of the glass is cut away to facilitate the removal of the cover.

Claim.—1. A jelly glass or tumbler provided with a recess or rabbet around the inside of its mouth to receive the edge of the cap or cover, as set forth.

2. In combination with the rabbet on the inside of the mouth of a jelly-glass, the break *c*, or its equivalent, made in the rim of the glass to facilitate the removal of the cover.

REISSUE PATENTS.

5,350.—*Wash-Boiler.*—JACOB DAVIS, Florida, Mass.—Patent No. 131,212, dated September 10, 1872. Application filed February 5, 1873.

A boiler has an elevated false bottom with a slot across the center that has a cap over it. The bottom has continuous ends that form tubes at the ends of the boiler, and have holes near the top for the ejection of the water and steam.

Claim.—1. The arrangement of the inclined bottom B with the slot *b'*, raised cover E, and plate F, as and for the purposes above described.

2. The construction and arrangement of the flues G as above specified, for the purpose of forcing the hot water through the holes *d'* upon the clothes.

3. A bottom, B, having slot *b'*, raised cover E, and plates D, with perforations *d'* at the top only, applied in combination with any suitable vessel, substantially as and for the purpose described.

5,351.—*Distilling Turpentine.*—ARCHIBALD K. LEE, Galveston, Tex.—Patent No. 131,550, dated September 24, 1872. Application filed April 8, 1873.

Steam is let into the jacket beneath the still, is superheated, passes into the coil within the still, and thence to a second and third perforated coil located within the reservoir and liquidising-chamber. On the pipe through which the vapors pass from the still to the separator is an egg-shaped or expanded joint for arresting and retaining the heavier vapors. The oil condensed may be drawn off. Any vapors given off in the liquidizing-chamber are conducted directly to the separator, from which the pyroligneous acid falls into a receptacle below from the worm; the turpentine is drawn through a series of vessels, where the water is separated, and the oil barreled without exposure.

Claim.—1. The still B, closed coil B', jacket C, and pipes C^2 C^3, when the same are combined as shown, and arranged in connection with a suitable furnace to operate substantially as described.

2. In combination with the coil B', the pipe G, the same being arranged to operate in connection with the still B, reservoir E, and liquidizing-chamber D^1, substantially as described.

3. The liquidizing-chamber D^1, having its interior wall surrounded with a perforated coil, F^2, and the revolving rake F, when the same are so combined and arranged as to operate substantially as described.

4. The chamber D^1, reservoir E, still B, valves D^2 and E^1, and the jacketed pipe E^2, the whole being constructed and arranged to operate substantially as described.

5. The vapor-pipe I, having an expanded joint, I^2, and cock I^3, when the same is connected with the still and separator in such manner as to operate substantially as described.

6. The separator H, vessel K, condensing-worm L^1, pipes L K^1, the same being so constructed, combined, and arranged as to operate substantially as described.

7. The condensing-worm L^1, vessels M N, and pipes M^1 N^1, the same being so constructed, combined, and arranged as to operate substantially as described.

5,352.—*Hasp for Trunk-Locks.*—LOUIS HILLEBRAND and DANIEL WOLF, Philadelphia, Pa., assignees of SAMUEL CROFT and JOHN C. SCHUELLERMANN, executors of CONRAD LIEBRICH, deceased.—Patent No. 10,862, dated May 2, 1854; extended seven years; reissue No. 4,170, dated November 1, 1870. Application filed February 12, 1873.

The two parts of the hasp are hinged together by means of solid trunnions on one part and recesses in the other part, the said trunnions being held into the recesses by a spring attached to the upper part of the hasp. The spring also serves to throw out and hold out the lower portion of the hasp, thereby preventing the catch from striking the edge of the trunk inclosing the lid.

Claim.—1. The combination, with a hinged trunk-hasp, of a spring attached thereto for operating the lower or hinged portion thereof, substantially as described.

2. The combination, with a hinged trunk-hasp, of a spring which is attached to the upper or fixed portion and throws out the lower or movable portion thereof, substantially as described.

3. The combination, with a hinged trunk-hasp, of a spring which serves to hold the parts together and also to throw out the lower or movable portion thereof, substantially as described.

4. The combination, with a hasp, of the solid trunnions *c* and recesses *b*, substantially as and for the purpose described.

5. The hasp-catch secured to a solid projection on the hinged portion of the hasp, substantially as and for the purpose described.

5,353.—*Oscillating Steam-Engine.*—AUGUST NITTINGER, Jr., Philadelphia, Pa.—Patent No. 106,860, dated August 30, 1870. Application filed September 27, 1872.

The valve-seat is made with a rounded concavity, into which the lower cylinder-head, with suitable ports, fits, and is held in place by springs and bolts to a plate with suitable ports in it for reversing the engine. The base plate is provided with uprights and catches to hold the reversing-plate in any position.

Claim.—1. The construction and arrangement of the bearings H, bolts *a*, nuts J, springs K, and the plate I, substantially as shown and described.

2. In combination with the above, the steam-chest A, base O, uprights N N', plate I, and the catches M, in the manner and for the purpose herein specified.

5,354.—*Windmill.*—WILLIAM I. TUSTIN, San Francisco, Cal.—Patent No. 97,136, dated November 23, 1869. Application filed January 16, 1873.

The wind-wheel and rudder are in two parts, connected together by a turn-table, so that the wheel can be turned about to stand at any angle to the rudder by means of a vertical rod, to which is attached an arrangement by which a person standing on the ground can easily shift the wheel.

Claim.—1. The table F with its projecting segmental rack *e*, turning on the flange *a*, in combination with the wheel E and rudder D, substantially as and for the purpose herein described.

2. The vertical connecting-rod I, wind-wheel E, and rudder D, in combination with the toothed wheel Q, pinion *g*, pulley G, endless cord, and weights P, substantially as and for the purpose above described.

3. The pulley G with its toothed pinion *g* and rudder-projecting lugs or pins *u*, the same being raised by means of the curved lever L, and operated by the endless cord *o* passing over pulleys N and O, and kept taut by the weight P, substantially as described, for the purpose herein set forth.

4. In connection with a windmill having a slewing-rudder for the purpose of adjusting the wind-wheel to the wind, the rod I, applied substantially as described, for changing the relative position of the wind-wheel and rudder from the ground, as set forth.

5,355.—*Corpse-Preserving Case.*—JOSEPH S. WATERMAN, Boston, Mass.—Patent No. 76,568, dated April 7, 1868. Application filed March 17, 1873.

Improvement on Patent No. 76,568, April 7, 1868.

Claim.—1. Making the ice-box B adjustable within the case A, so that it can be raised or lowered to increase or diminish the size of the corpse-chamber, for the purposes set forth.

2. The combination of the inclined metallic bottom *h* of the ice-box with conductors *k o*, when said conductors are covered with wood or its equivalent, substantially in the manner described, as and for the purposes set forth.

5,356.—*Jelly-Glass.*—WILLIAM DOYLE, Birmingham, Pa.—Patent No. 136,492, dated March 4, 1873. Application filed April 11, 1873.

Claim.—1. A jelly-glass adapted for the reception of a cap or cover of sheet metal or equivalent material, by leaving it substantially in the condition in which it comes from the molds, without being subjected to the ordinary finishing processes, as above set forth.

2. A jelly-glass adapted for the reception of a flanged cap or cover of sheet metal or equivalent material, substantially as hereinbefore described.

3. As an article of manufacture, a jelly-glass provided with a flanged cap or cover of sheet metal or equivalent material.

4. As an article of manufacture, a jelly-glass provided with a cap or cover of sheet metal or equivalent material capable of being secured to the glass without the use of cement, or of rubber bands or rings.

5,357.—*Smoothing and Fluting Iron.*—JOHN HEWITT, Pittsburg, Pa.—Patent No. 135,335, dated January 28, 1873. Division A. Application filed February 25, 1873.

An iron in two sections; when together for smoothing by the lower section, and when detached for fluting by the upper section; have corrugations for that purpose.

Claim.—An iron consisting of two independent sections, A and B, one having a plain and the other a fluting ironing-face, substantially as hereinbefore described.

5,358.—*Fluting-Iron.*—JOHN HEWITT, Pittsburg, Pa.—Patent No. 135,335, dated January 28, 1873. Division B. Application filed April 8, 1873.

The iron is constructed in the form of the ordinary sad-iron, but having face provided with fluting-ribs.

Claim.—A fluting-iron with corrugations extending the entire length of its ironing-surface, the contour of said iron being the same as the ordinary sad or smoothing iron, having a conform point, substantially as herein described, and for the purpose set forth.

5,359.—*Spring for Vehicles.*—CYRUS W. SALADEE, St. Catharine's, Canada, assignor of one-half interest to LEANDER DOBBINS, Erie, Pa.—Patent No. 132,603, dated October 29, 1872. Application filed April 4, 1873.

Upon the bolster of a car-truck are arranged torsional springs which have their ends bent to form a crank or lever; these cranks engage with other cranks which are rigidly secured to an equalizing-shaft, the latter being secured to the bed-plate of the truck. By this arrangement the body of the car rides evenly, although the weight is unequally distributed.

Claim.—1. In combination with bolster D and bed-plate D' of a railway-car truck, springs A A with the equalising-shafts B B, the latter carrying on their opposite ends the cranks C C, all substantially as and for the purpose set forth.

2. In combination with the lever ends of the torsional springs, cranks C, arranged and operating substantially as and for the purpose set forth.

3. The arrangement of torsional springs A in pairs, so that the bearings J and J' shall be on a parallel line with each other and with the edges of the bed-plate, as and for the purpose set forth.

INDEX OF INVENTIONS PATENTED APRIL 15, 1873.

[The numbers in parentheses denote the classification of patents.]

Air motor, compressed, (2,) H. Bushnell 137,899
Animal matter for fertilizers, &c., deodorizing, (96,) E. C. C. Stanford 137,969
Awning, (30,) G. W. Geran 137,772
Basket, grain, (169,) H. C. Jones 137,845
Basket, grain, (169,) H. C. Jones 137,846
Basket and bird cage, combined hanging, (63,) S. Vanstone 137,980
Bed bottom, (92,) C. Gense 137,909
Bedstead, invalid, (2,) O. G. Cosby ..... 137,[illegible]
Bee hive, (9,) S. T. Davis 137,831
Bee hive, (9,) C. Finn 137,834
Biscuits, manufacture of sweet, (58,) H. Even 137,766
Boiler tube scraper, (148,) J. B. Christoffel 137,826
Boiler, wash, (136,) J. Davis, (reissue) 5,350
Boiler, wash, (136,) W. Exner 137,902
Boilers, compound for preventing incrustations in steam, (148,) J. J. Lavo 137,935
Boilers, manhole lid for, (148,) R. Tippett 137,806
Bolt, door, (24,) A. G. Hofstatter 137,841
Bolt for doors, &c., (24,) J. S. R. Wright 137,964
Bolt and rod cutter, (14,) S. H. Preston 137,956
Boot, (16,) G. S. Lee 137,781
Boot and shoe last, (16,) W. H. Rounds 137,799
Boring blind stiles, machine for, (30,) L. G. Kirkham 137,932
Bottle stopper, smelling, (1,) Marble and Glidden 137,938
Bottles and other vessels, device for closing, (58,) J. Matthews 137,941
Bread raising apparatus, (88,) J. Sutton 137,974
Bridle bit, (72,) C. L. Ginkinger 137,913
Broom protector, (22,) G. Hunt 137,774
Burner, gas, (64,) E. Foote 137,905
Burner, gas, (64,) L. W. Shaler 137,964
Burnishing tool, welt edge, (16,) M. J. Ferren 137,903
Butter package, (45,) J. Andrews 137,752
Button, (23,) M. P. Carpenter 137,824
Car axle, railroad, (122,) T. C. Theaker 137,977
Car, convertible freight, (121,) W. Worsley 137,871
Car coupling, (122,) D. O. Pender 137,860
Car spring for vehicles, (31,) C. W. Saladee, (reissue) 5,359
Car, wheelbarrow dumping, (31,) H. J. Peters 137,862
Cars, driving gear for hand, (122,) J. D. Hinckley 137,922
Cars, single tree for horse, (122,) J. Wills 137,990
Carriage, (31,) L. Gleseukamp 137,914
Carriage axles, machine for turning, (100,) H. E. Forrest 137,769
Cart loading apparatus, (79,) B. G. Fitzhugh 137,768
Carving machine, (173,) H. Grubenbecher 137,837
Cigars, machine for cutting and perforating, (160,) J., T., and A. Levy 137,850
Cloth measuring register, (37,) S. Crocker 137,829
Coal dust as fuel in furnaces, using anthracite, (61,) A. Berney 137,820
Coffee roaster, (154,) J. Hart 137,839
Coffin handle, (39,) J. S. Ray 137,958
Collar button or stud, (23,) J. I. Waddell 137,807
Cooking apparatus, (154,) C. Hood 137,843
Cooler, refrigerator water, (58,) T. Smith 137,967

Corn husking glove, (59,) P. N. Harts 137,918
Corn husking thimble, (59,) Gash and Owens 137,771
Corn sheller, (59,) Hollen and Holland 137,842
Corn sheller, (59,) R. M. McGrath 137,942
Corpse preserving case, (39,) J. S. Waterman, (reissue) 5,355
Corset, (80,) M. Cohn 137,893
Corset, (80,) A. M. Weber 137,985
Cotton cultivator, (43,) C. F. Reams 137,959
Cotton stalk knocker, (173,) M. M. Carruth 137,825
Cradle, (62,) D. Sonder 137,868
Cranks, apparatus for heating, (60,) J. Miller 137,944
Crayon holder, (146,) A. F. Howard 137,844
Cuff, reversible, (38,) L. H. Foy 137,907
Cultivator, (43,) J. M. Knox 137,933
Cultivator, (43,) A. Leonard 137,782
Desk and seat, school, (62,) J. B. Sherwood 137,866
Die rolling machine, (125,) H. Waters 137,984
Digger, potato, (114,) D. M. and G. E. King 137,931
Distilling turpentine, (47,) A. K. Lee, (reissue) 5,351
Door plate and letter chute, combined, (24,) B. Morningstar 137,946
Dovetailing machine, (173,) T. Cullen 137,830
Drain, sink, (8,) G. R. Moore 137,788
Drawers, supporter for men's, (23,) E. R. Cleaveland 137,761
Dress pattern, (38,) E. P. Smith 137,967
Drill, grain, (133,) F. Keller 137,929
Duster, broom corn, (22,) J. L. Stranahan 137,805
Egg carrier, (116,) E. L. Mueller 137,791
Electrical apparatus, connecting post for, (50,) T. Wishart 137,810
Elevator, (79,) J. F. Marsh 137,940
Elevator, (79,) W. A. Morrison 137,789
Engine, hydrodynamic steam, (152,) W. Burnett 137,759
Engine, motor, (118,) T. D. Richardson 137,865
Engine, oscillating steam, (150,) A. Nittinger, Jr., (reissue) 5,353
Engine piston valve, steam, (152,) G. M. Weinman 137,986
Engine, rotary steam, (150,) L. F. Parker 137,795
Exercising machine, (143,) S. M. Barnett 137,876
Fan, automatic, (165,) H. T. McCormick 137,785
Faucet, (167,) H. Varwig 137,981
Felly, (31,) Perryman and Mathews 137,955
Fence, portable, (52,) A. W. Olds 137,949
File, paper, (146,) C. D. Lindsey 137,851
Filter for cane juice, oil, &c., (155,) A. K. Lee 137,849
Fire arm, breech loading, (18,) A. E. and P. J. Jarre 137,927
Fire arm, revolving, (123,) O. A. Smith 137,968
Fire arms, hook attachment to bands of, (55,) I. Merrill 137,786
Fire arms, swivel loop for, (55,) E. Whitney, Jr 137,989
Fire extinguisher, (35,) C. A. Cox 137 895
Fire place grate, (154,) J. M. Woodcock 137,993
Fishing torch, (90,) S. Bartholomew 137,877
Fluting iron, (38,) J. Hewitt, (reissue) 5,358
Fruit press, (19,) O. Metcalf 137,787
Furnace, blast, (85,) J. G. Blunt 137,884
Furnace, gas retort, (37,) W. C. Wren 137,811
Furnace, hot air, (154,) J. D. Hall 137,838
Furnace, hot air, (154,) B. C. Sayre 137,800
Gang plank, (137,) F. G. Johnson 137,776
Gas retort compound, (64,) Kreischer and Tartiere 137,934
Gate, automatic, (58,) G. B. Stevenson 137,971
Generator, steam, (150,) D. Parsell 137,953
Glove, gauntlet, (38,) L. B. Whipple 137,988
Glue, (26,) O. S. Follett 137,835
Grain weigher, (132,) J. W. Hill 137,921
Harness clasp, (72,) M. A. Penn 137,954
Harness trimming, manufacture of rubber coated, (84,) A. Albright 137,873
Harrow, (73,) D. L. Jaques 137,926
Harvester, (74,) G. W. N. Yost 137,812
Harvester, (74,) G. W. N. Yost 137,813
Harvester, (74,) G. W. N. Yost 137,814
Harvester, (74,) G. W. N. Yost 137,815
Harvester seat, (74,) G. W. N. Yost 137,816
Hasp for trunk locks, (93,) C. Liebrich, (reissue) 5,359
Heater and filter, combined, (148,) W. T. Bate 137,878
Hinge, gate, (24,) J. H. Stone 137,973
Hinge, spring, (24,) J. Palmer 137,951
Hobby horse, (143,) J. A. Crandall 137,896
Hoe, (141,) H. R. Barnes 137,755
Horse collar, (72,) E. Batwell 137,879
Horseshoe, (60,) M. C. Clark 137,891
Horseshoe attachment, (60,) P. H. O'Neill 137,794
Horseshoe calk, machine for grinding, (60,) J. Little 137,852
Horseshoe nails, manufacture of, (60,) H. D. Cowles 137,762
Horseshoes, swage for forming, (60,) Hofstatter and Shaw 137,923
Hose holder, garden, (63,) H. C. Smith 137,802
Hose and pipe coupling, (167,) T. R. Button 137,823
Hose pipe nozzle, (167,) Berryman and Wakefield 137,881
Houses, construction of, (39,) D. L. Emerson 137,833
Hub for heavy wheeled vehicles, (31,) J. J. Anderson 137,874
Indicator, station, (146,) J. K. Magie 137,853
Jack, hydraulic, (118,) R. Dudgeon 137,765
Jelly glass, (88,) W. Doyle, (reissue) 5,356
Jelly-glass, (88,) T. A. Zellers 137,995
Knitting machines, weight hook for, (89,) C. H. Koegel 137,778
Ladder, extension, (92,) W. O'Connor 137,948
Lathes and planers, magnetic chuck for, (100,) J. A. Jaques, J. T. Oakley, and L. Sterne 137,875
Leather, machine for cutting, (92,) N. Paquette 137,952
Loom, (95,) J. C. Duckworth 137,898
Loom picking mechanism, (95,) R. Ross 137,798
Loom shedding mechanism, (95,) J. Lomas 137,935
Lumber, cutter for tonguing and grooving, (29,) D. Perrin 137,861
Matches, manufacturing, (71,) O. H. Hicks 137,840
Meat or fruit press, (19,) L. S. Starrett 137,803
Mechanical movement, (67,) E. C. Hopping 137,924
Mill, starch, (145,) C. Gilbert 137,912
Millstone picks, stock for, (57,) F. Trump 137,979
Mold for casting molds, (33,) J. S. Elliott 137,901
Mortising machine, (173,) G. F. Outten 137,950
Motive power, (67,) G. Meyer 137,856
Mowing machine, (74,) G. W. N. Yost 137,817

Sewing machine stand, (134) R. M. Wanzer 137,983
Sewing machine thread cutter, (134,) F. V. Oburg 137,947
Sheet metal vessels, manufacture of, (136,) J. G. L. Boettcher 137,826
Sheet metal wares, handle for, (136,) J. W. Lamb 137,848
Shoe pegging and trimming machine, (16,) R. E. Draper 137,887
Shutters, manufacture of corrugated metal, (4,) A. Clark 137,827
Sieve, flour, (170,) J. T. Foster 137,906
Signal for railroad crossings, automatic, (120,) R. Walker 137,803
Skate, (143,) J. T. Larkin 137,780
Sky light, metallic, (4,) G. E. Dayton 137,832
Sleighs, combined rave and fender for, (31,) S. M. Stewart 137,804
Smoothing and fluting iron, (38,) J. Hewitt, (reissue) 5,357
Sofas, &c., bottom for, (62,) I. Mason 137,784
Soldering machine, (136,) W. D. Brooks 137,888
Spinning jack, self-acting, (142,) J. E. Knight 137,777
Spring, door and gate, (24,) J. T. Foster 137,770
Spring, vehicle torsion, (31,) R. Dudley 137,899
Starch, apparatus for the manufacture of, (145,) C. Gilbert 137,911
Steel, manufacture of, (65,) J. G. Blunt 137,885
Stills, (142,) G. J. Stevens 137,869
Stone, artificial, (153,) A. Ott 137,859
Stone crusher, (3,) H. R. Marsden 137,939
Stove, coal, (154,) H. Meidinger 137,855
Stove dome, (154,) A. Taylor 137,976
Stove, heating, (154,) Akers and Johnson 137,818
Stove pipe, (154,) L. Jurgens 137,928
Stove for heating soldering irons, tinner's, (136,) C. A. Buttles 137,890
Table, dining, (62,) A. Land 137,779
Table, extension, (62,) E. Hambuljer 137,917
Table leaf support, (62,) H. Imhof 137,925
Thrashing machine, (159,) C. M. Powers 137,863
Thrashing machine, (159,) A. Wemple 137,809
Tire tightener, (31,) W. D. G. Quigley 137,957
Tobacco plant cutter, (63,) J. N. Cady 137,760
Torpedo for oil wells, (124,) A. Hamar 137,916
Trap, animal cage, (143,) S. W. Rice 137,864
Trap, fish, (143,) C. E. Ketcham 137,930
Trap for bedsteads, bed bug, (62,) C. Legab 137,936
Trimming, (38,) W. Murray 137,857
Trimming, (38,) W. Murray 137,858
Tube sockets, machine for bending, (163,) W. L. Newsham 137,792
Tubing, sheet metal, (163,) S. R. Wilmot 137,991
Tubing, manufacture of sheet metal, (163,) S. R. Wilmot 137,992
Turn table, (121,) A. P. Boller 137,887
Vulcanizing rubber coated articles, (84,) A. Albright 137,872
Wagon, road, (31,) C. W. Faladee 137,963
Wash board and rubber, (91,) C. Krebs 137,847
Water elevator, (118,) J. A. Ayres 137,754
Water wheel gate, (168,) J. M. Burgbardt 137,822
Water wheel, turbine, (168,) J. C. Green 137,836
Whip socket, (31,) L. D. Benner 137,880
Winding wads, machine for, (109,) A. C. Hobbs 137,773
Windmill, (118,) W. D. Nichols 137,793
Windmill, (118,) W. L. Tustin, (reissue) 5,354

Window frame and sash, (30,) J. McNamee 137,943
Wrench, screw, (100,) D. Frank 137,908
Wrench, railroad track, (100,) P. L. Gibbs 137,910

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED APRIL 15, 1873.

Acme Mower and Reaper Company, assignee 137,812, 137,813, 137,814, 137,815, 137,816, 137,817
Akers, W. R., and J. E. Johnson, Heating stove 137,818

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125 00 per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

COMMISSIONER'S DECISIONS.

WM. E. LOCKWOOD.—*Extension.*

[*Appeal from principal Examiner in the matter of the application of Wm. E. Lockwood for extension of patent No.* 23,771, *granted April* 26, 1859; *reissued, Nos.* 1,981, 1,982, *and* 1,983, *June* 6, 1865, *and No.* 5,259, *dated January* 29, 1873, *for* IMPROVEMENT IN COLLARS AND CUFFS, *Decided April* 22, 1873.]

Although there may be donbts as to the patentability of a supposed invention, and there has been a decision of the Circuit Court against it, yet, if an appeal has been taken from the decision, and is pending, and if the invention has created and supplied an extensive demand in market, and has been recognized by the public as one of great utility, a patent for it will be extended.

It would seem that a collar, specified as having a paper surface imitative of the textile face and fiber of a dressed linen collar, is the same thing as an embossed collar when the embossing is explained in the specification to mean a process by which the inequalities upon the surface of a linen collar are reproduced on the surface of a paper collar, and it is made to look like a linen collar.

The extension of a patent refused because there was no sufficient proof of the value and importance of the invention.

LEGGETT, *Commissioner:*

The invention shown in the original patent is a collar or cuff made of a suitable fabric inclosed between two layers of paper, upon which is impressed the counterpart of the figure and fabric of a linen collar or cuff, thus producing an exact imitation of the linen article. This is ornamented by perforations, by printing, and by interlacing ribbon in slits made for the purpose. The claims of the existing reissued patents are:

No. 1,981.—"An ornamental collar or cuff made of a fabric composed of paper and muslin, or of an equivalent fabric, ornamented by printing, or otherwise marking on the surface plain or colored devices."

No. 1,982.—"An ornamental collar or cuff made of a fabric composed of paper and muslin, or an equivalent fabric, ornamented by perforations, as set forth."

No. 1,983.—"An ornamental collar or cuff made of a fabric composed of paper and muslin, or of an equivalent fabric, ornamented by the interlacing of colored tapes or ribbons, as set forth."

No. 5,259.—"A collar having a paper surface imitative of the textile face and fiber of a dressed linen collar, as set forth."

There was a reissue, No. 1,980, granted June 6, 1865, with the following claim:

"An embossed collar or cuff made of a fabric composed of paper and muslin, or an equivalent fabric."

This patent and reissue, No. 1,981, were held by Judge Blatchford in *Union Paper Collar Co.* vs. *Van Deusen* et al., *Pat. Off. Gaz., vol.* 2, *p.* 361, to be invalid. The learned Judge said: "It is impossible to uphold either of these reissues. No. 1,980 is merely for embossing on a surface which imitates starched linen. * As like embossing had been done on starched linen, the result of producing such embossing on a smooth, white, polished, or enameled surface, representing that of starched linen, cannot be patented as an invention, when nothing is claimed as new in the appliance, machinery, or process for producing the embossing. A starched linen collar with its surface embossed existed before. There was nothing of patentable novelty in the idea that the imitative surface being provided it would be well to emboss it. The patent does not claim the invention of the imitative surface, or of any means of producing it. The fabric of paper and muslin was old. The same observations apply to No. 1,981. It is merely for printing plain or colored devices on a surface which imitates starched linen. * * Printing had been done before on a smooth, white, enameled surface, * and the surface imitating starched linen being provided there was nothing of patentable novelty in the idea of printing upon such surface. The invention of the imitative surface is not claimed, nor is any means of producing such surface claimed, and the fabric to be printed upon was old."

Precisely the same reasoning applies to the claims of reissues Nos. 1,982 and 1,983, provided, as the Examiner assumes, ornamental perforations and interlacing colored tapes or ribbons had previously been used in linen

collars or cuffs. This probably presents the adverse view of the validity of the patents Nos. 1,981, 1,982, and 1,983 in the strongest light. With respect to patent No. 1,983, no sufficient proof of the value and importance of the invention claimed is presented, and an extension must be refused for that reason. An appeal to the Supreme Court of the United States is pending upon reissue No. 1,981. No. 1,980 was surrendered, and No. 5,259 was issued in lieu thereof on appeal to the Board of Examiners-in-Chief, covering, as is alleged in argument, the "imitative surface"—the omission of claim to which the Court repeatedly referred to. In view of the interpretation placed upon the claim of patent No. 1,980, however, it is not clear that the imitative surface referred to in this claim is anything but the embossed surface which the Court held to furnish no ground for a reissued patent to Lockwood. The Court said the specification (No. 1,980) "defines the embossing to be a representation of embroidery, or of ornamentation whereby portions of the surface are depressed and portions are in relief. It describes a mode of effecting the embossing, * * whereby all projections, depressions, stitches, and marks on the original linen collar or cuff are reproduced, and the plain surface looks like starched linen." With that explanation "an embossed collar" (claim No. 1,980) and "a collar having an imitative surface," &c., (claim No. 5,259,) are the same thing. The reasoning of the Court, therefore, apparently applies with equal force to patent No. 5,259.

I shall not attempt to controvert the opinion of the learned judge who is so justly eminent in the department of patent law. On the other hand, an appeal having been taken to the Supreme Court, I am not disposed to be so far controlled by it as to cut off the remedy there relied on by refusing an extension. It is undeniable that Lockwood has produced articles which have created and supplied a distinctive and extensive demand in the market. They are recognized by the public as a definite class of products of great utility. Precisely the same things did not exist before. The additions to the Walter Hunt fabric which they exhibit are certainly important in connection with it, if not vital to the permanent popularity and usefulness of paper collars and cuffs. Whether or not Lockwood's devices as claimed are so different from what preceded them as to evince invention in their production, I think is a point upon which at least a reasonable doubt may be entertained, and I am inclined to hold that they are. If I am correct in holding the claims valid, the proof upon other points is sufficient to warrant the extension of patents Nos. 1,981, 1,982, and 5,259. These patents will therefore be extended upon compliance with the rules.

CARR *vs.* DAVIDS.

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the application of Thomas Carr and the patent of G. B. Davids, granted December 14, 1869, for a* DISINTEGRATING-MILL.—*Decided April 24, 1873.*]

The right of an inventor to a patent will not be prejudiced by the existence of the invention abroad, unless it was patented or described in some printed publication before he originated it.

LEGGETT, *Commissioner:*

It is proved and admitted on the part of Carr that Davids made his invention in September, 1868. Carr obtained a patent for his invention in England, which was enrolled April 6, 1869. He introduces testimony to show that he made the invention in England long before that date, which testimony has been ruled out by the Examiner of interferences and the Board, in conformity with the established practice of the courts and the Office. (See *Howe* vs. *Morton*, 1 Fish., 595; *Brooks* vs. *Norcross*, 2 Fish., 661; *Bain* vs. *Morse*, 1 B. app., p. 222; *ex parte* Jno. Cochrane, Com'rs D. 1869, p. 60; *Tucker* vs. *Davis*, O. G., vol. 2, p. 224)

I do not find sufficient ground in the argument presented in behalf of Carr for a departure from this practice. The statute is explicit in declaring that any inventor may obtain a patent for his invention, provided it has not been patented or described in a printed publication in a foreign country before the date of his invention. Davids made the invention before it was so patented or described, and his right to a patent is clear.

No evidence of the date of an invention in a foreign country, other than that of a patent or a description in a printed publication, ever has been or can be received under the law. Inventions abroad are ignored by the statute until made to appear through one or the other of the channels named. Therefore Carr did not make the invention in contemplation of law till he patented it, April 6, 1869, and Davids preceded him. Without the light of controlling precedents, I should be unable to place any other interpretation upon the statute than that which constitutes the established practice of the Office in like cases.

The decision of the Board is affirmed.

JOHN B. WELPTON.—*Motion.*

[*In the matter of the application of John B. Welpton for the reissue of Letters Patent No. 125,237, for* IMPROVEMENT IN TUG-CLIPS, *granted him April 2, 1872.—Decided February 3, 1873.*]

Where, in answer to an application by A, reference is made to a rejected joint application of A and B, the affidavits of both that B had no part in making the invention are not sufficient to remove the objection.

An interference should be declared in such a case, and the question settled on testimony, or on formal concessions in accordance with the rules.

THACHER, *Acting Commissioner:*

It appears that in 1870 applicant joined with one Templeton in an application for a patent for an invention somewhat similar to the present. This application was finally rejected in February, 1871, since which nothing further has been done in prosecution of the case. The patent now sought to be reissued contained no claim to anything shown in the former application of Templeton and Welpton, and therefore no conflict at the time of its issue arose. In the present application for reissue a claim is made which the Examiner holds to be anticipated by the prior joint application.

Affidavits of both parties to the joint application have been filed, setting forth the fact that Templeton had no part in the invention of devices therein claimed or described, and motion is made that on this showing the application for reissue be relieved from the operation of the reference. I believe this would be wrong practice, which might in some cases prejudice the rights of third parties. The correct practice in cases of this kind, and one which is now well established in the Office, is to declare an interference with the prior joint application, when the rights of the respective parties may be settled by testimony as to the facts, or formal concessions in accordance with provisions of official rules.

The motion is denied, and the application is remanded to the Examiner with instructions to declare an interference with the rejected application.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

LEVI DECKER *vs.* THE NEW YORK BELTING AND PACKING COMPANY.

[*In Equity.—Before Blatchford, Judge.—Decided April 9, 1873.*]

A circuit court of the United States cannot through service of process in its district upon an officer of a corporation created under the laws of another State acquire jurisdiction over the corporation.

A corporation does not in consequence of appearing by attorney, and pleading to the jurisdiction of the court, waive the objection.

This was a motion for a provisional injunction in a suit in equity under reissued letters patent granted to Levi Decker, March 9, 1869, for improvement in cushions for billiard-tables.

It appeared that the defendant was a Connecticut corporation. Process had been served on one of its officers in the city of New York. The defendant had appeared by solicitors and filed a plea to the jurisdiction.

W. J. A. Fuller, for the plaintiff.
B. F. Lee, for the defendants.]

BLATCHFORD, *J.:*

The case of *The Commercial and Railroad Bank of Vicksburg* vs. *Slocumb*, (14 Peters, 60, 64, 65,) is a decisive authority that a corporation does not waive an objection to the jurisdiction of the court over it by appearing and pleading by an attorney to the jurisdiction of the court. That jurisdiction over a Connecticut corporation cannot be acquired by this court by service of process on one of its officers in this district, is settled by the cases of *Day* vs. *The Newark India Rubber Manufacturing Company* (1 Blatchf., C. C. R., 628) and *Pomeroy* vs. *The New York and New Haven R. R. Co.* (4 Id., 120.)

The motion for an injunction is denied for want of jurisdiction of the court over the defendants.

U. S. CIRCUIT COURT—DISTRICT OF CALIFORNIA, NINTH JUDICIAL CIRCUIT.

DAVID McKAY *vs.* JOHN B. WOOSTER *et al.*

[*In Equity.—Before Sawyer, Judge.—Decided April 7, 1873.*]

A patented article purchased from one who has unqualified authority to sell it becomes like other property, and the purchaser may use it as he pleases, without any liability under the patent.

Where the assignee of the entire interest in a patent for a specified territory sells the patented article therein, the purchaser is not restricted in his use of it to that territory, neither is he liable to the patentee for using it in the territory reserved.

Neither is he liable to one to whom the right for the territory reserved is sold by an assignment subsequent to the other.

Doubted whether an assignee of a territorial right under a patent could sell the patented article so as to authorize the use of it in territory the right to which had been sold to another before he purchased.

Doubted what the effect would be of a clause in a deed of a territorial right expressly restricting the right to sell for use so that only sales for use in the territory shall be made under it.

[*Holland and Spencer*, for complainants.
Churchill and Haight, for defendants.]

SAWYER, *J.:*

Bill to restrain infringement of patent.

The following facts appear from the stipulation of the parties filed in the case:

On February 26, 1867, a patent was duly issued to J. L. and G. W. Stevens, of San Francisco, for an "improvement in cases for transporting eggs."

In August, 1872, said patentees, by deed, granted and assigned to H. F. Billings, of Chicago, in the State of Illinois, "for, to, and in all the States and Territories of the United States east of the Rocky Mountains, all the right, title, and interest which they, the said John L. and George W. Stevens, had in and to the said letters patent, and the invention as secured to them by said letters patent, and all their rights, liberties, privileges, and franchises which they had or might acquire by or under the said letters patent," which said deed was duly recorded. Since said assignment said Billings has erected a manufactory for said patent cases for the transportation of eggs at Chicago, in the State of Illinois, and has manufactured, in accordance with the specifications of said patent, and he still continues to manufacture said cases; and he has sold and continues to sell the same "to the public, or to whomsoever desires or desired to purchase them, without any restriction or reservation whatsoever."

On the 17th of October, 1872, said J. L. and Geo. W. Stevens made a similar transfer of all their right, title, and interest in said patent and invention, in and to all the States and Territories lying west of the Rocky Mountains, to the complainant, David McKay, who thereupon entered upon the manufacture of said patent cases at San Francisco, and he has ever since continued to manufacture and sell the same for use in that portion of the United States lying west of the Rocky Mountains.

The defendants are commission merchants doing business at San Francisco, receiving goods consigned by merchants east of the Rocky Mountains and selling the same on commission. M. Evans & Co. are merchants doing business at Ames, in the State of Iowa, and a part of their business is dealing in eggs. Said Evans & Co., between the 17th of October, 1872, and the filing of the bill in this case, purchased in the usual course of business at Chicago, of said Billings, [illegible] any restriction or reservation on the part of [illegible] of said patent cases manufactured by him as aforesaid, filled them with eggs in the State of Iowa for the purpose of transportation, and shipped about [illegible] with eggs to defendants at San Francisco, who received them and sold the eggs on commission in the regular course of their business as commission merchants. [illegible] the use of the aforesaid cases in the transportation of eggs from the Rocky Mountains to San Francisco, the said complainant complained of, and the threatened

continuance of the practice, and further use and sale of the cases so received, the injuries sought to be restrained. Numerous other parties are engaged in similar transactions.

Under the view I take, the only question necessary to determine seems to be precisely the same decided by Shepley, Circuit Judge, in *Adams* vs. *Burke*, 4 Fisher's Patent Cases, 393, viz: "Does the purchase of a patented artice, *lawfully* manufactured, and *sold without restriction or condition*, within his territory by the territorial assignee of a patent right, convey to the purchaser the right to use or sell the article in another territory for which another person has taken an assignment of the same patent?"

The learned judge answers the question in the affirmative. This is the only case I have found in which the precise question has ever been considered. One would suppose that a question of so much importance, and so likely to arise, would long since have been presented to the Supreme Court and authoritatively determined, but it does not appear to have been done. It is insisted that the case cited is not correctly decided, and argued with a great deal of force, that since Lockhart and Seeley, in that case, and Billings in this, only purchased the right of the patentees in a limited territory, they did not themselves have the right to supply, either directly or indirectly, other territory than that purchased; that their right only extended to making, using, and vending *to be used* in the specific territory purchased; that, as they had themselves no right to use in other territory, their vendees could acquire no greater right than they themselves owned; that their purchase of the right to a specific territory necessarily limited their power to sell the machine to be used in that territory alone; that this limitation and restriction is necessarily implied in the sale, even without any express stipulation to that effect; that the patent under the fifth section of the act of Congress of 1836 in terms gives the patentee "the full exclusive right and liberty of making, using, and *vending to others to be used*" the said invention throughout the jurisdiction of the United States; that the eleventh section authorizes him to assign the whole or part of his interest for "any specific part or portion of the United States;" that when he assigns his entire interest for a specified part he assigns the right acquired under the fifth section of "making, using, and vending to others *to be used*" in that specific part, and "to be used as well as to make and use in that part *alone;*" that, therefore, when an assignee of a specific territory sells a machine in that territory the machine so sold is taken out of the monopoly as to that territory only, there being no power in the vendor to withdraw it from the monopoly as to other territory in which he has no monopoly or control, and that he can only dispose of his own share of the monopoly, or liberate therefrom to the extent of his own interest therein. This, it is argued, is the reasonable construction of the law, and the contract of assignment of the right of the patentee to a specific part of the territory authorized by the act. The consequences of a different view are also urged in support of the position taken, some of which, it is said, find a striking illustration in this case. Thus, it is argued that labor and materials being cheaper, and the other facilities for cheap manufacture being greater at Chicago than at San Francisco, the patent cases for transporting eggs can be made at a cost so much lower at Chicago than at San Francisco, that the purchaser of the Chicago manufacture could undersell the complainant in his own territory. Eggs also being so much cheaper east than west of the Rocky Mountains, large quantities are there purchased and sent to these western markets. The transportation of the patent cases costs nothing, because it is necessary in shipping to use boxes or cases of some kind, and these require no more room than others.

The freight is paid on the eggs as merchandise, and the greater security against breakage and the improved condition of the eggs brought in these cases more than compensate for their cost at Chicago. Those dealing in eggs, therefore, can purchase these patent cases at Chicago, ship them with eggs from any part of the United States east to parts westward of the Rocky Mountains, and after disposing of their contents sell them at half cost, or even give them away, and still make a remunerative profit on their transactions. There is no use for the cases for return freight. Thus the entire market west of the Rocky Mountains, including nearly one-third of the territory of the United States, can be wholly supplied, indirectly, through middlemen, at prices less than it is possible to make the article for here, by parties who have only purchased the territory east, to the utter loss or ruin of those who have purchased and paid for the territory west of the Rocky Mountains. So, again, it is said it may well be in the case of many inventions that some particular locality affords such facilities for cheap manufacture that the whole United States may be supplied from that point at prices that would defy competition in any other locality, so that it would only be necessary to purchase the right for the territory on which the factory is located in order, through middlemen, to practically enjoy a monopoly of the whole country.

It is easy to see that the result of supplying the whole country indirectly through the merchant, who is usually the seller to the consumer, is precisely the same as though the maker himself directly sells to the consumer.

It must be confessed that these arguments are entitled to grave consideration. Enough has been said in this, and in the case cited, to render it manifest that great practical inconvenience may result from either view.

In the absence of an authoritative adjudication, I should hesitate long before venturing to dissent from a well-considered decision of so learned, experienced, and eminent a jurist as Judge Shepley. But in this instance I can perceive no good ground for doubting the soundness of the proposition laid down in the guarded form in which it is stated in the case cited.

An important question not discussed by the learned judge may, however, arise as to when, or under what state of facts, a patented machine may be regarded as "*lawfully * * * * sold without restriction or condition within his territory, by the territorial assignee of a patent right.*"

In the case now under consideration it will be seen by reference to the stipulated facts that the assignment to Billings was made in August, 1872, while that to complainant was not made till October following. If

there is any conflict, therefore, in the rights claimed by the parties, the complainant's assignment, so far as the conflict is concerned, being subsequent in time, was taken in subordination to the prior grant to Billings—that is to say, he could only take by his assignment what was left after Billings' interest had been carved out. At the date of the assignment to Billings the patentees were still the holders of the entire interest under the patent. Had they at that time, at Chicago, sold one of the patented articles in question without restriction or condition, that undoubtedly would have been a lawful sale without restriction or condition, and the article so sold would have been taken out of the monopoly, and the purchaser, or any one deriving title through him, would have been entitled to use it till worn out in any part of the United States. The patentee himself could not by a subsequent assignment of his patent have limited the right of the purchaser already vested. The vendor being at that time entitled to the whole monopoly for the entire jurisdiction of the United States, it was competent for him to wholly emancipate the article sold by taking the entire royalty for the use in any part of the territory. And a sale without restriction or limitation would work such emancipation. In such case any party subsequently purchasing the right to any specific portion of territory would take that right subject to the use of the machine so sold at any point within the territory purchased. What the patentees could do with respect to one machine, they could do as to any number of machines in existence or to be brought into existence. What they could do themselves they could by contract authorize or convey the right to any other party to do. As the patentees themselves could *lawfully sell* these patented articles at Chicago *without restriction or condition*, so as to authorize the purchasers, or those claiming under them, to use the machines anywhere in the United States, they could convey the right to Billings to lawfully do the same. This authority to emancipate from the monopoly by an unrestricted sale was a part of their "right, title, and interest in the invention secured by the patent," that could be exercised and enjoyed at Chicago or other place east of the Rocky Mountains as well as elsewhere. The assignment to Billings is in the broadest terms. It is of "all the right, title, and interest which the said John L. and George W. Stevens had in and to the said letters patent, and the invention as secured to them by said letters patent, and all their rights, liberties, privileges, and franchises which they had or might acquire by or under said letters patent," "for, to, and in all the States and Territories of the United States east of the Rocky Mountains." There is no limitation of the power to vend within the territory. The patentees could lawfully make without restriction or condition, could use without restriction or condition, or could *vend without restriction or condition* anywhere within the specified territory, and all their rights they conveyed to Billings *without restriction or condition*, who thereupon stepped into the shoes of the patentees as to the territory sold. Had they intended to limit the right of vending "to vending to be used" by the purchasers within the territory sold only, they should at least have so specified the intention, and by some apt words restricted the right of use in the deed of assignment. This unrestricted assignment of the right to vend put it in the power of Billings to *lawfully* vend the patented article within his territory without restriction or condition, and thereby wholly emancipate from the monopoly the articles so sold. The complainant subsequently purchased his territory, and, whatever the terms of his grant, he could of course only obtain what was left of the franchise or monopoly. As the patentees, after their sale to Billings, could not object to sales by him without restrictions or conditions, their subsequent assignee cannot object. The latter's right is subject to the right of Billings and those who have lawfully purchased without restriction or condition from him. This is as far as it is necessary to go in this case. It is unnecessary now to consider the effect of an express limitation in the deed of assignment of the right to vend for the purpose of use only within the purchased territory, or how far the complainant, being a subsequent purchaser of territory, can lawfully vend without restriction or condition, so as to wholly emancipate the article sold from the monopoly, and enable the purchasers of the patented article of his manufacture to use it in the territory of Billings.

If there is any practical hardship in the construction adopted of the law and contract under it, and it should turn out to be the correct construction, then the patentee, when he desires to assign, must consider whether he can afford to do so without restriction, and the subsequent purchaser, when he wishes to buy, must determine whether he can afford to do so with the burden entailed upon his territory by a prior grant unlimited in the particulars indicated. There must be a decree for defendants. Let the bill be dismissed with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,094.—*Apparatus for Heating the Feed-Water of Steam-Boilers.* Granted to JOHN F. BROOKS, May 24, 1859. Hearing May 7, 1873.

24,098.—*Sewing-Machines.*—Granted to PETER S. CARHART, May 24, 1859. Hearing May 7, 1873.

24,102.—*Platform-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSE, May 24, 1859. Hearing May 7, 1873.

24,182.—*Machines for Channeling and Edging Soles of Boots and Shoes.*—Granted to MARTIN WESSON, May 24, 1859. Hearing May 7, 1873.

24,199.—*Gas-Regulators.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,200.—*Hydro-Carbon Vapor-Apparatus.*—Granted to E. HALL COVEL, May 31, 1859. Hearing May 14, 1873.

24,227.—*Cultivators.*—Granted to R. M. MELTON, May 31, 1859; reissued April 16, 1872. Hearing May 14, 1873.

24,257.—*Seats and Couches for Railroad Cars.*—Granted to THEODORE T. WOODRUFF, May 31, 1859. Hearing May 14, 1873.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT F. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL F. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALMER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABBATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHNEBLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, JR., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 16, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,683.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, JR., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 30, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread in Balls.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,750.—*Improvement in Animal-Traps*, granted to A. S. BLAKE, April 26, 1859.

Claim.—A trap having its spring D attached below the jaws *c c*, and the spring brought within or nearly within the diameter of the jaws, as and for the purpose herein shown and described.

23,771.—*Improvement in Ladies' Collars and Cuffs*, granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued June 6, 1865, numbered 1,980; reissued January 28, 1873, numbered 5,259.

Claim.—A collar having a paper surface imitative of the textile face and fiber of a dressed linen collar, as set forth.

23,771.—*Improvement in Ladies' Collars and Cuffs*, granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued June 6, 1865, numbered 1,961.

Claim.—An ornamental collar or cuff, made of a fabric composed of paper and muslin, or of an equivalent fabric, ornamented by printing or otherwise marking on the surface plain or colored devices.

23,771.—*Improvement in Ladies' Collars and Cuffs*, granted to WILLIAM E. LOCKWOOD, April 26, 1859; reissued June 6, 1865, numbered 1,962.

Claim.—An ornamental collar or cuff made of a fabric composed of paper and muslin, or an equivalent fabric, ornamented by perforations, as set forth.

23,792.—*Improvement in Gas-Pipe Cutters*, granted to JOSEPH E. STANWOOD, April 26, 1859.

Claim.—1. An improved pipe or round rod cutter, as provided, with a rotary cutting-wheel to operate in conjunction with the claw or pipe-rest, as specified.

2. The arrangement of the cutting-wheel carrier in a recess, C, formed in the claw-block B, in combination with the arrangement of the adjustable screws *d e*, and handle-rod F, with respect to the said recess and the cutter-wheel carrier, the whole being as specified.

23,795.—*Improvement in Pump-Boxes*, granted to FRANCIS STOCK and JOHN STOCK, April 26, 1859.

Claim.—The arrangement of the parts *j k l* of the box D, in connection with the bolts or rods *p p* and valve E, substantially as herein shown and described.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date April 22, 1873.]

6,594.—*Carpet.*—JOHN FISHER, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,595.—*Coffin-Handle.*—NEHEMIAH HAYDEN, Essex, Conn. Application filed April 12, 1873.

6,596.—*Carpet.*—HENRY HORAN, Newark, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,597.—*Carpet.*—HENRY HORAN, Newark, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,598.—*Carpet.*—HENRY HORAN, Newark, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,599.—*Carpet.*—HENRY HORAN, Newark, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,600.—*Carpet.*—HENRY HORAN, Newark, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,601.—*Carpet.*—HENRY HORAN, Newark, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,602.—*Carpet.*—HENRY HORAN, Newark, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,603.—*Reed-Organ Case.*—JOHN R. LOMAS, New Haven, Conn., assignor to BERNARD SHONINGER, same place. Application filed March 15, 1873.

6,604.—*Carpet.*—LEVI G. MALKIN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,605.—*Carpet.*—LEVI G. MALKIN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,606.—*Carpet.*—ELEMIR J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,607.—*Carpet.*—ELEMIR J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,608.—*Carpet.*—HENRY NORDMANN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,609.—*Picture-Frame.*—BURT H. SLUMBER and LORENZO PEARSON, South Bend, Ind. Application filed March 17, 1873.

6,610.—*Carpet.*—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,611.—*Carpet.*—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

6,612.—*Carpet.*—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 11, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date April 22, 1873.]

1,218.—*Soap.*—R. W. BELL & Co., Buffalo, N. Y. Application filed January 29, 1873.

1,219.—*Bourbon Whisky.*—DU VIVIER & Co., New York, N. Y. Application filed April 14, 1873.

1,220.—*Rye Whisky.*—DU VIVIER & Co., New York, N. Y. Application filed April 14, 1873.

1,221.—*Bourbon Whisky.*—DU VIVIER & Co., New York, N. Y. Application filed April 14, 1873.

1,222.—*Rye Whiskey.*—DU VIVIER & Co., New York, N. Y. Application filed April 14, 1873.

1,223.—*Hair-Dressing.*—EDWARD A. E. MEYER, Watertown, N. Y. Application filed April 12, 1873.

1,224.—*Cosmetic.*—MILLER BROTHERS, New York, N. Y. Application filed April 10, 1873.

1,225.—*Yeast-Powder.*—PRESTON & MERRILL, Boston, Mass. Application filed February 4, 1873.

1,226.—*Starch.*—PROCTOR & GAMBLE, Cincinnati, Ohio. Application filed March 31, 1873.

1,227.—*Cigars.*—SEIDENBERG & Co., New York, N. Y. Application filed April 12, 1873.

1,228.—*Mineral Water.*—ALONZO L. KANE, Milwaukee, Wis., doing business as THE SILOAM MINERAL-SPRING COMPANY. Application filed March 20, 1873.

1,229.—*Flour.*—JONES, WILLIAMS & FAXON, Boston, Mass. Application filed April 18, 1873.

1,230.—*Grinding-Mills.*—THE STRAUB MILL COMPANY, Cincinnati, Ohio. Application filed March 19, 1873.

1,231.—*Opera-Glasses, Field-Glasses, and other Telescopes.*—SUESFIELD, LORSCH & Co., New York, N. Y. Application filed April 18, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date April 22, 1873.]

ORIGINAL PATENTS.

137,926.—*Cooking-Stove.*—AMOS C. BARSTOW, Providence, R. I. Application filed March 14, 1873.

A horizontal sliding shelf placed at the side or rear of the stove or range and beneath the oven-flue, and so arranged as to be self-supporting in any position.

Claim.—1. In ranges or cooking-stoves, of whatever construction, but having a baking-oven with or without a warming closet, the arrangement of a shelf sliding in horizontal guides under the oven, so that it may be slid out for use, and back if not needed, substantially as herein shown and set forth.

2. A sliding shelf, arranged to run in horizontal guides or ways beneath or within the oven-heating flue, and formed with a lug or stop, or its equivalent, so located as to prevent the shelf from being drawn entirely out, and to arrest its outward movement at a point where it will still engage with its guides or ways to such an extent as to be self-supporting, substantially as shown and set forth.

137,927.—*Machine for Uniting the Selvages of Knit Fabrics.*—THOMAS BEVEN, Ward's End, Loughborough, assignor to JOHN MUNDELLA, Nottingham, England. Application filed November 4, 1872.

Two sets of points are used and the loops of one selvage are set up on each. As the points come together and one set laps the other, the loops of one selvage are transferred to the points which hold the other, and both are then fed to a sewing mechanism.

Claim.—The arrangement and combination of the two sets of points or holding instruments acting substantially as described, whereby parts of looped fabrics to be united are brought together for that purpose, as set forth.

137,928.—*Dredger.*—EPHRAIM B. BISHOP, San Francisco, Cal. Application filed August 15, 1872.

The conical screws are attached to the prow of a boat and are rotated through the gear-wheels. A central screw is placed below the two usual main screws, which cuts a passage for the keel of the vessel. A screw point or bit is attached to the front end of the screw C to open the way for it.

Claim.—1. The screw C placed below the plane and inclination of the screws A B, in combination with the screws A B, substantially as and for the purpose set forth and described.

2. The auxiliary screw-point or bit I, substantially as described, for the purpose set forth.

137,929.—*Turning-Lathe for Wood.*—CHARLES A. BLESSING, Philadelphia, Pa. Application filed February 7, 1873.

The material from which the article is to be formed is placed between revolving centers and operated upon by a revolving cutter which is secured in an oscillating frame.

Claim.—1. The vibrating frame E, cords or chains and weights *m' m'* and M' M', and cams N N, when the same are connected, combined, and arranged, as herein described, so that the weights constantly act to draw the frame forward, yet its approach shall be regulated, and at the proper time its return impelled, through the action of the cam, substantially as described.

2. The cams N N, shaft N^1, worm-wheel N^2, shaft O having worm O' and bevel-gear *o*, and the bevel-gear A attached to the shaft H, when the same are combined and arranged to operate substantially as described.

3. The shaft H, loose pulley and clutch P P^1, clutch P^2, lever R, spring S, chain S^1, weight T, and pawl-lever W, the whole being combined and arranged to operate substantially as described.

4. The pinion-shaft F, disk G, pawl-plates G' G', springs *g g*, and the tube E^2, having irregular surfaces *f f'*, when the whole is combined and arranged to operate substantially as described.

5. The knives or cutters D D', having their edges formed as shown in Figs. 1 and 3, and secured to the shaft C, to operate substantially as and for the purpose specified.

138,000.—*Trunk.*—MARTIN H. BLISS, Dalton, Mass. Application filed May 17, 1872.

The hinged section, when open, lies back upon the uppermost part of the trunk and brings the carved board, carrying the mirror, upright into position for use; when closed, it completes the face of the trunk-lid and engages with the hinged section to close the recess for the pigeon-holes.

Claim.—1. In the construction of a bureau-trunk, the hinged section a, carrying the carved board *b* and glass *c*, in the manner described, and for the purposes specified.

2. In the construction of a bureau-trunk, the hinged section a and the hinged lid C, when combined and operated together, to close and conceal the series of pigeon-holes 5 6 7 8, while at the same time adapted for independent uses—the first as a support for the glass *c*, and the second to form the writing-desk C C.

3. As an improved article of manufacture, the transformable piece of furniture described, when formed and adapted for the alternate uses of a trunk, bureau, and desk, in the specific manner set forth.

138,001.—*Capping Piano-Hammers.*—ISAAC BULLARD, Readville, assignor of one-half his right to JOHN B. WARREN, Boston, Mass. Application filed February 8, 1873.

Claim.—The method of attaching the caps to piano-forte hammers by means of an elastic cement, substantially as described.

138,002.—*Beer Attachment for Soda-Water Apparatus.*—WILLIAM R. CADY, Lowell, assignor to JAMES W. TUFTS, Medford, Mass. Application filed April 4, 1873.

Within the apparatus is a receptacle, into which the beer is admitted through an inlet pipe leading from the barrel or fountain and provided with a stop-cock, the beer being drawn by its own gravity from the bottom of the receptacle without foam. An auxiliary draft cock, connected with that portion of the inlet-pipe containing beer under pressure, may be employed, if desired, to produce a little foam at the top of the beer in the glass.

Claim.—1. The beer vessel or receptacle C, arranged within a soda-water apparatus, and provided with an outlet or delivery pipe, A, and draft-cock *i*, in combination with the inlet-pipe D leading from the barrel or fountain, and the cut-off or stop-cock E, all operating substantially in the manner and for the purpose set forth.

2. In combination with the above, the auxiliary pipe *l* with its draft cock *k* connected with the inlet-pipe D between the stop-cock E and the barrel or fountain, substantially as and for the purpose described.

138,003.—*Check-Hook for Harness.*—HIRAM A. CARLTON, Chelsea, Mass. Application filed August 14, 1872.

The hook is intended to be secured to the back-band of double harness, and in lieu of a saddle or pad.

Claim.—The said harness check-hook, made substantially as described, viz., of the hook, the slide, and the holding stud or button, arranged and combined essentially as set forth.

138,004.—*Loom-Temple.*—NATHAN CHAPMAN, Hopedale, Mass. Application filed March 31, 1873.

Claim.—1. The hinged trough H, in combination with the horizontal arm I and spring-bolt I^1, for locking the trough at its free end.

2. The stud E fastened in the stock D, in combination with the roller E' and the hinged cap F, provided with a lug for holding the roller on the stud and allowing it to be removed to clean and oil it.

3. The spring D^1, in combination with the stock D, when arranged to raise the rear end of the stock when it is pushed back and bring the notches D^2 against the cap of the rear stud, and lock the stock back.

138,005.—*Machine for Finishing Slate-Frames.*—JAMES H. COFFIN and GEORGE S. COFFIN, Danielsville, Pa. Application filed February 25, 1873.

The corners and edges of slate-frames are rounded without removal from the cutters in the complete process by the slot and pivot-screw.

Claim.—The frame G having rounded corner *a*, flanges *b b*, diagonal slot *d* with screw *e*, in combination with the cutter-head D and gage E, substantially as and for the purpose specified.

138,006.—*Making Rubber Stereotypes.*—GEORGE K. COOKE, New York, N. Y. Application filed September 2, 1872.

The sheet of rubber is clamped between a plate and a plaster cast of the type, and vulcanized over a suitable heating apparatus.

Claim.—The process, hereinbefore described, for producing flexible printing-forms from vulcanized-rubber composition by the combined agency of dry heat and pressure, applied substantially as specified.

138,007.—*Soluble Chocolate.*—JOHN CORELL, New York, assignor of one-half his right to GEORGE W. CLEMINSON, Brooklyn, N. Y. Application filed April 4, 1873.

Cacao-beans are roasted, then ground to an impalpable liquid paste and then mixed with uncrystallisable sugar.

Claim.—The new article of manufacture of soluble chocolate made in the manner and of the ingredients substantially as hereinbefore set forth.

138,008.—*Carriage-Door.*—JAMES CUNNINGHAM, Rochester, N. Y. Application filed August 11, 1871.

With the door and sash of a landau-carriage are combined slides, which hold the sash and are raised automatically by it from the interior of the door.

Claim.—1. The separate slides C C, combined with the sash B and door A, as herein described, said slides being operated automatically by the sash itself in raising or lowering, and the whole folding compactly with the body of the door, as specified.

2. The slides C C constructed with the bearings *c c* for holding the sash in a vertical position when lowered, and with the offset *d* to allow the sash to be set at an angular position when raised, as herein described.

138,009.—*Window.*—SAMUEL DARLING, Providence, R. I. Application filed August 21, 1872.

Layers of colored muslin, or its equivalent, are introduced between two thicknesses of glass, either fluted or plain, to give the effect of colored or stained glass.

Claim.—1. A window having two thicknesses of glass, with fine muslin or its equivalent between them, substantially as described.

2. A window having two thicknesses of clear glass, one or both fluted, with muslin between, substantially as and for the purpose set forth.

3. A window having one or more thicknesses of fluted arranged with colored glass, substantially as described.

138,010.—*Heel-Stiffening for Boots and Shoes.*—FRANKLIN E. DARROW and OSCAR E. WAIT, Rockport, Mass. Application filed January 13, 1873.

Claim.—A molded or shaped heel-stiffener made entirely of rawhide, and by means of heated dies, substantially as described.

138,011.—*Anti-Friction Journal.*—MELVILLE E. DAYTON, Syracuse, assignor of part interest to HAMILTON B. TOMPKINS and WILLIAM H. WIETING, New York, N. Y., and HENRY A. BRANCH, Hilladale, Mich. Application filed September 21, 1872.

The rollers upon the shaft are held in place by means of a yielding metallic box, made of a single coil of spring-steel, or by forming a plate of metal into a cylinder, the edges of which being so shaped as to interlap—the object being to keep the shaft, rollers, and box always in close contact.

Claim.—1. The yielding or adjustable case E, in combination with anti-friction rollers, substantially as described, and for the purposes specified.

2. In combination with the yielding case E, the adjustable jaws F F, substantially as described, and for the purposes set forth.

3. The solid annular guide M, constructed separately, substantially as described, and for the purpose set forth.

4. The spacing-strap X, with oblong perforations or open slots, substantially as described, and for the purposes set forth.

5. The spacing-straps with open slots, joined by connections *e e*, substantially as described, and for the purposes set forth.

6. In combination with the slotted spacing-strap X, the collar *d* upon the gudgeons *c* of the rollers B, substantially as described, and for the purpose set forth.

138,012.—*Piano-Forte Bridge.*—WILLIAM C. ELLIS, Worcester, Mass. Application filed September 10, 1872.

Glass or other solid plates are interposed between bridge and tuning-pin block to insulate the vibrations of the string.

Claim.—The bridge *a*, in combination with the block *b* and insulator *d*, substantially as specified.

138,013.—*Dumping-Cart.*—BENJAMIN G. FITZHUGH, Frederick, assignor to MATHIAS MARTIN, Baltimore, Md. Application filed August 23, 1872.

Claim.—1. The weighted automatic locking-lever F, having a fulcrum-bearing, E, in the body of the cart, and an arm or arms, *b*, which serve to lock the body with the shafts automatically and to maintain the lock, as described.

2. In combination with the lever F, arranged and connected with the body as described, the cord H, by which the body is dumped and brought up into position after being dumped, as described.

3. The cart having its supporting-wheels G, rear end D of the body C, axle-tree B, and shaft-hinges *a*, in such relation to each other that when the body is dumped its rear upper edge will strike the ground and arrest the body to dump the load, as described, and shown in the drawing.

138,014.—*Curtain-Roller Holder.*—BENJAMIN G. FITZHUGH, Frederick, assignor to MATHIAS MARTIN, Baltimore, Md. Application filed October 7, 1872.

The holder is in place of the ordinary bracket, and is made of India rubber, has a hole for the axis of the curtain-roller to run in, the hole being much smaller than said axis so as to grasp and hold the roller and curtain in any desired position, but yielding sufficiently to be moved by the cord of the roller.

Claim.—The combination, with a curtain-roller, of a rubber-bracket binding-bearing, to hold the curtain, as described.

138,015.—*Molding-Machine.*—JOHN W. GHEER, Wilmington, Del. Application filed May 18, 1872.

The feed-rollers of India rubber are inclined to the table to bind the "stuff" thereto when passing under the cutter. Provision is made for their adjustment outwardly by the slots in the the supporting-brackets, while the lower ends continue in gear with the driving-wheels.

Claim.—1. The feed-rolls G' G' made with elastic surfaces and mounted upon shafts, arranged as shown and described, to permit a lateral adjustment of the rolls to and from the cutter-head, and a lateral adjustment of the table, as specified.

2. In combination with the collars F having arms F' F', the shafts E and G G, slotted bars H H, and wheels *e e'* and *g g'*, so as to permit a vibratory or swivel motion of the shafts G G, for the purpose of accommodating the feed-rollers to different thickness of stuff while retaining the wheels *g g' e e'* in gear.

3. In combination with the table I, the arm I', collar *i*, rod *k*, arm *i'*, and screw L, substantially as specified.

138,016.—*Gas Light and Pressure Indicator.*—WILLIAM W. GOODWIN, Camden, N. J. Application filed August 9, 1871.

On an ordinary gas-pressure dial an additional scale is inscribed, showing the candle-light power corresponding to the graduations of pressure.

Claim.—In photometers, the combination of the two scales *a'* and *h''* with the index, as shown in the drawing, for the purpose hereinbefore set forth.

138,017.—*Drawers.*—BENJAMIN J. GREELY, Boston, Mass. Application filed June 28, 1872.

With bottoms stiffened to hold the pants in place and body cut away, except as to side extensions by which they are hung.

Claim.—1. Drawers without a waistband, constructed, as above described, by cutting away the front or back, or both, so that they will have no binding-action around the waist of the wearer.

2. The stiffened drawers-legs, constructed and operating as described.

138,018.—*Roller-Skate.*—WASHINGTON PARKER GREGG, Boston, Mass. Application filed October 21, 1869.

To a parlor-skate of four rollers is added a convertible arrangement for two large center-wheels.

Claim.—1. In roller-skates having four wheels, arranging the journals of the two large side wheels above the stock, substantially as shown in Fig. 5, for the purpose described.

2. As a new article of manufacture, a convertible skate, which can be used either with or without the large side wheels D E, Figs. 6 and 7, at the option of the wearer, becoming, when said wheels are dispensed with, the four-wheeled skate represented in Figs. 1 and 2, and when they are applied the skate represented in Figs. 6 and 7.

138,019.—*Middlings-Separator.*—ABSALOM R. GUILDER, Minneapolis, Minn. Application filed January 25, 1873.

Peculiar construction of bolting-reel, as shown, air-cylinder inside of reel, and such an arrangement of air-passages that all of the flour is subjected to a current of cool air, whether the flour is in the bolt-chamber, in the bolt, or in falling from the bolt after having been bolted; these air-passages and air-cylinder communicating with an eddy-chamber above the bolting-reel for separating the heavy particles of bran from the air before being drawn off by the suction-fan.

Claim.—1. The bolt-reel F, constructed with the short shaft a^6, spider K, ribs *f'*, truss-rods *f''*, and head F''', in the manner and for the purposes substantially as described.

2. The arrangement, in a flour-bolt, of the swinging doors *c*, air-passage *c'*, aperture *d'''*, stops *g''*, openings controlled by slides b^5 and b^6, eddy-chamber A' with compartments *i*, *i'*, *i''*, and *i'''*, and openings *j* and *j'* in partitions *b''*, with the exhaust-fan *a''* and eduction-air opening a^6, in the manner and for the purpose described.

3. The arrangement, in a flour-bolt, of the swinging doors *c*, air-passages *c'* and *c''*, horizontal air-conduit *c'*, flues *c' c''*, and *c'''* having valve c^6 therein, eddy-chamber A', with compartments *i*, *i'*, *i''*, and *i'''*, and openings *j* and *j'* in partitions *b''*, with the exhaust-fan A'' and eduction-air opening a^6, in the manner and for the purposes described.

4. The air-cylinder G, when constructed and arranged, with relation to the bolt-reel F, eddy-chamber A', exhaust-fan A'', and air-exit a^6, substantially as shown.

5. The eddy-chamber A', composed of compartments *i*, *i'*, *i''*, and *i'''* and openings *j* and *j'* and ingress-air chambers *b'''* by way of apertures controlled by slides b^5 and b^6, when arranged upon the top of a bolt-chest, A, and used in combination with a revolving bolt-reel, F, and air-exhaust fan A'', in the manner substantially as described.

138,020.—*Shuttle-Binder for Looms.*—GARDINER B. HAMMOND, Putnam, Conn., and JOHN A. TUCKER, Attleborough, Mass. Application filed March 26, 1873.

For the easy removal and attachment of the binder a knuckle-joint is used, consisting of two interlocking pieces held in position by a button, which is fastened by a screw. By loosening the screw sufficiently to give the button a half revolution the binder can be at once removed.

Claim.—A fastening for a shuttle-binder, consisting of the jointed pieces E and F and the button G, constructed and used substantially in the manner and for the purpose set forth.

138,021.—*Millstone-Dress.*—JOHN P. HARRIS, Greensborough, Ga. Application filed March 31, 1873.

Grinding-surface diminished toward periphery and enlarged at center, where the leverage is greatest.

Claim.—The millstone-dress, consisting of the furrows C C', deepest at the center, and widening toward the periphery of the stone, in combination with the lands D D widening toward the center of the stone, substantially as and for the purposes set forth.

138,022.—*Folding Book-Case.*—EZRA HASKELL, Dover, N. H. Application filed September 4, 1872.

The case is formed by two upright sides, which are in two parts and hinged together, and have compound grooves in them for the reception of shelves. To iron projections on the shelves backs are attached by hinges, so that the whole can be taken apart and packed into a small compass.

Claim.—The combination of the upright folding sides A B and grooves C with the shelves and backs E having the projections *a*, as and for the purpose specified.

138,023.—*Composition Pavement.*—DANIEL C. HELLER, Reading, Pa. Application filed January 3, 1873.

The lower stratum or foundation of the pavement is composed of coal-tar, one-half gallon; gravel, one-half bushel; dry earth, one-fourth gallon, mixed. This is then spread and rolled, and upon it is laid a surface-dressing composed of dry sand, one-fourth bushel; sifted coal-ashes, one-half gallon; dry slaked lime, one-fourth gallon; coal-tar, five-eighths gallon. The surface is finished by rolling.

Claim.—A composition pavement formed by combining coal-tar, lime, sand, dry earth, sifted coal-ashes, and broken stone or gravel, or their equivalents, substantially in the manner herein described, and for the purpose set forth.

138,024.—*Clothes-Pounder.*—SAMUEL HINKEL, Goodville, Pa. Application filed March 25, 1873.

A wash-pounder constructed with its outer form beveled or funnel-shaped, with outside air-conductors, and a center one connected with the handle, which is surrounded by a hoop or outer ring, perforated for the free circulation of water. To the bottom of the handle is attached a valve over an opening in it and an opening above for the admission of the air.

Claim.—The combination of the central cylinder C and valve E of the handle H and air-passages F *f*, together with the perforated intermediate cylinder B, conic or funnel form portion A with its air pipes and passages D, all arranged substantially in the manner and for the purpose mentioned.

138,025.—*Steam-Generator.*—ROBERT HOOPER, Baltimore, Md. Application filed January 31, 1873.

A diaphragm arranged near the bottom of the boiler is combined with channels, which extend along the side to near the surface of the water, for creating a better circulation. Pipes in the furnace connect the crown-sheet and front water-leg below the diaphragm, while other pipes connect the rear water-leg above the diaphragm and others below the grate-bars.

Claim.—1. The diaphragm E, with the channels K, in combination with the front tube-head *c'*, substantially as and for the purpose herein set forth.

2. The combination of the crown-sheet of the furnace, circulating-pipes G, front tube-head *c'*, and diaphragm E, substantially as herein set forth, for the purpose specified.

3. The combination of the tubes F and circulating-pipes H with the inside front sheet of the furnace, front tube-head *c'*, and diaphragm E, relatively arranged, substantially as and for the purpose herein set forth.

4. The combination of the diaphragm E and channels K with the engine feed-pipes L, as and for the purpose specified.

138,026.—*Bundling Kindling-Wood and other Substances.*—HENRY A. HOUSE, Bridgeport, Conn.—Case B. Application filed December 6, 1872.

The wood is packed in gage-rings, which are successively fed into the machine and then forced, by a plunger, through a compressing-cylinder, and at the outlet the bundles are tied with a cord, fastened with metallic clasps.

Claim.—1. The gage-seat P', in combination with a charging-gage, P, which is open at both ends, and a tubular compressing-chamber, C, which opens into said seat, substantially as and for the purpose described.

2. The inclined feeding-guides N, combined with the tubular compressing-chamber C and gage-seat P', substantially as described.

3. The ring-discharger T, arranged below the bed, and under the perforated seat P', in combination with the plunger D, chamber C, and guides N^1 N^1, substantially as and for the purpose described.

4. The combination of the chamber C, plunger or pressing head D, wrapping devices, and clinching devices, substantially as and for the purposes specified.

5. The combination of the wrapping devices, the clinching devices, and a cutter, c^1, as herein described, with a chamber, C, substantially as specified.

6. The combination of the tension devices *c c²* and a wrapping device, *a*, with the tapered compressing-chamber C, substantially as described.

7. The chamber C, in combination with the wrapping and clinching devices, substantially as described.

8. The flier-arm *a*, in combination with the chamber C, and the plunger D, and devices for crossing and holding the cord, substantially as described.

9. The inclined chute or guide N^2, in combination with the gage-seat P, for conveying the empty ring-gages back into the filling-boxes, substantially as described.

10. The combination of the wrapping mechanism, the clinching mechanism, and the compressing mechanism, shaft B, cams D^5 E, and tripping-plate G, all substantially as set forth.

138,027.—*Machine for Bundling Kindling-Wood and other Substances.*—HENRY A. HOUSE, Bridgeport, Conn.—Case C. Application filed December 6, 1872.

The material being forced through the compressing-cylinder, a binding apparatus carries a cord around the bundle as it protrudes from the outer end of the cylinder, and by the action of a spring-hammer a metallic clasp around the crossed ends of the cord is clinched against a small anvil; a knife then severs the cord.

Claim.—1. The intermittent flier-arm *a*, for carrying a cord or band and applying the same around bundles of kindling-wood or other substance, in combination with the clinching mechanism, substantially as described.

2. The tubular shaft a^2, carrying the flier-arm *a* and receiving through it the binding material, and acted on by a check-spring, *e*, in combination with the clinching mechanism, substantially as described.

3. The combination of the tension device, flier-arm *a*, and the clinching mechanism, substantially as described.

4. The cam-plate E on shaft B, having teeth *b'* on its periphery, for giving intermittent motion to the shaft a^2 of the flier-arm *a*, substantially as described.

5. The cam-tail a^3 on the flier-arm *a*, in combination with a lever, *d*, for actuating the staple-carrier *s*, substantially as described.

6. The slotted sliding staple-carrier *s*, receiving through it the clinching-tool *i*, and operating substantially as described.

7. The combination of the anvil *p*, staple-carrier *s*, and clinching-tool *i*, substantially as described.

8. The staple-feeder A, combined with and arranged over a sliding staple-carrier, *s*, which has a clinching-tool moving through it, substantially as described.

9. The hammer f^1 on arm *f*, actuated by a spring, f^2, tripping-lever f^3, and tripping-cam G, in combination with the clinching-tool *i*, substantially as described.

10. The cutter c^1 applied to the lever *c*, and operating substantially as described.

11. The intermittently-rotating plate *k*, carrying jaws *w* and lugs 2 on its periphery, for griping the binding-cord from the flier-arm *a*, substantially as described.

12. The beveled guides *k'*, in combination with the jaw *w*, substantially as and for the purposes described.

13. The cam-plate *g*, in combination with the griping-jaws *w*, for the purpose of causing these jaws to gripe and release the binding-cord at the proper times, substantially as described.

14. The lever J^1, actuated by the cam-plate E, and carrying the pawl *j* and the connecting-rod *j'*, substantially in the manner and for the purposes described.

138,028.—*Postal-Card Machine.*—JOHN M. D. KEATING, New York, N. Y. Application filed July 3, 1872.

The paper is fed intermittingly under the shears and cut into cards, which are deposited on a fly. At the same time a blank, gummed on one edge, is fed by a supporting-table under the plunger, which reciprocating movement trips the fly and raises the card to a vertical position, when its lower edge rests on the gummed end of the blank and its upper edge lies under the hooks of the plunger side. The plunger, descending, bends up the four flaps of the blank within right-angular folding-guides, causing the gummed one to adhere to the card, and deposits the two in this relative position within the folders and retreats. The three free flaps of the blank are then folded down, followed by the card which lies upon them.

Claim.—1. The combination, with the plunger J and plate K, of the fly-plate *g*, for receiving and delivering the card in proper position to be united to the envelope or flap, substantially as described and specified.

2. The hooks *t t* or equivalents upon the plunger-plate K, to insure the cards being carried downward with the envelope or flap as the plunger descends, substantially as described and specified.

3. In combination with the plunger J, plate K, and fly *g*, the finger-bars *f f*, constructed and operating substantially as described and specified.

4. In combination, a reciprocating carriage to convey the envelope-blanks under a plunger, a feeding device and cutting mechanism for feeding and cutting the cards, a mechanism for receiving and delivering the cards, and a mechanism for uniting the cards by adhesion, all co-operating together substantially in the manner described and specified.

138,029.—*Wrought-Iron Beam.*—LANCELOT KIRKUP, East New York, N. Y., assignor of two-thirds his right to STEELE & CONDICT, Jersey City, N. J., and HARRIS WILSON, Brooklyn, N. Y. Application filed February 7, 1873.

Beam constructed to avoid lateral strain, and the capacity of the beam made greater.

Claim.—The combination of the web A, top plate B, bottom plate C, braces D, and angle-irons E, constructed and operating substantially as and for the purposes described.

138,030.—*Laying Concrete Pavement.*—JOHN W. KRAUSE and HENRY W. KRAUSE, Jr., Philadelphia, Pa. Application filed March 18, 1873.

Claim.—The within-described mode of laying artificial pavements, the same consisting in covering the entire space to be occupied by the pavement with a single solid mass of material in a soft state, then cutting said mass into blocks separate and distinct from each other, with interstices between them, as shown and set forth.

138,031.—*Universal Coupling.*—HERBERT S. LELAND, Canton, Ohio. Application filed March 28, 1873.

The coupling-sleeve is provided with suitable bearings upon its inside for the reception of gudgeons of the connecting-ring. This ring is also provided with bearings similar to those of the coupling-sleeve, for the reception of the gudgeons of the spherical socket, which is arranged within.

Claim.—1. In a shaft-coupling, the combination of a coupling-sleeve, coupling-ring, and spherical socket, constructed and arranged so that the coupling-ring may be revolved on its bearings in the coupling-sleeve; and also so that the spherical socket may be revolved on its bearings in the coupling-ring, substantially as and for the purpose specified.

2. The combination, with the coupling-ring of a shaft-coupling, of a spherical socket, made of a sufficient size to admit and hold one of the shafts to be coupled without the aid of a side sleeve, and so arranged that it may be revolved on its bearings in the coupling-ring, substantially and for the purpose specified.

3. A spherical socket for shaft-couplings with gudgeons cast thereon of an elongated form, substantially as and for the purpose specified.

4. The combination of a spherical socket with elongated gudgeons with a coupling-ring having circular inner bearings connected by grooves with its outer edges, substantially as and for the purpose specified.

5. A coupling-ring for shaft-couplings with gudgeons cast thereon of an elongated form, substantially as and for the purpose specified.

6. A coupling-sleeve for shaft-couplings, with circular inner bearings cast thereon, with grooves connecting said bearings with the end of said coupling, substantially as and for the purpose specified.

7. The combination of a coupling-ring with elongated gudgeons with a coupling-sleeve having circular inner bearings, connected by grooves with its end edge, substantially as and for the purpose herein specified.

138,032.—*Cigar-Holder.*—T. JOHN LEWIS, Chicago, Ill. Application filed December 16, 1872.

The mouth-piece or holder is retained in the mouth by a bent-wire attachment resting within the cheek. A spur secures the cigar in the holder.

Claim.—1. The cigar-holder A provided with a retainer, E, as and for the purpose set forth.

2. The combination of the holder A, spur B, and retainer E, substantially as and for the purpose set forth.

138,033.—*Automatic Gate.*—NATHAN LONG, Muncie, Ind. Application filed January 27, 1873.

The gate is hung upon a rod resting or supported in a short lever, which is connected to horizontal rods and cranks, operated by the vehicle. The rod has a lower bearing in the hinge-post, and inclines outward toward the top of the gate, with its upper end hooked into another bearing on hinge-post.

Claim.—The inclined rod C with crank *d*, eyes *a a*, hinges *b b'*, lever *e*, rods and cranks D E, and gate B, all constructed and arranged as and for the purpose specified.

138,034.—*Apparatus for Cleaning Cess-Pools, &c.*—WILLIAM C. MCCARTHY, Pittsburg, Pa. Application filed December 2, 1872.

The arrangement and construction of the several globe-valves and pipe-connections. The filling and discharging openings are such that the tank may be used as a vacuum-tank, or may be filled by buckets, as becomes necessary.

Claim.—1. The air-tight tank B provided with a discharging-orifice, M, in combination with a movable or detachable door, N, as and for the purposes set forth.

2. The air-tight tank B, discharging-orifice M, movable or detachable door N, in combination with the receiving-pipe K and valve L, as and for the purposes set forth.

3. The air-tight tank B, discharging-orifice M, movable door N, in combination with the valves C C', as and for the purposes set forth.

4. The tank B, discharging-orifice M, movable door N, in combination with the opening D and its lid E, as and for the purposes set forth.

5. The large discharging-orifice M, in combination with a detachable door, N, and circumferential collar P, as and for the purposes set forth.

6. The combination and arrangement, with the top of the tank, of the central opening D, provided with a detachable lid, E, held in place by a circumferential screw-collar, F, as and for the purpose set forth.

7. The combination and arrangement of the opening D and lid E with the funnel G, as and for the purposes set forth.

8. The opening H in the front end of the tank, in combination with its lid J and collar *i*, as and for the purposes set forth.

9. The catches S S and lugs *o e*, in combination with the orifice M, movable door N, and its surrounding frame, as and for the purposes set forth.

10. The tank B, discharging-orifice M, movable door N, opening D, and its lid E, in combination with the wagon A, substantially as shown.

138,035.—*Mold for Earthen Pipes.*—PETER MCINTYRE, Hartford, Conn. Application filed December 2, 1872.

Central plug can be manipulated so as to free foot of core and allow sectional core to be withdrawn.

Claim.—The combination of the base *c*, the sectional core *d*, the plug *d'* arranged to move downward in order to release the foot of the core, the rod *h*, the cap *d'*, and the thumb-screw *h'*, all arranged as described, for the purpose set forth.

138,036.—*Car-Wheel.*—HELEM MERRILL, Brooklyn, N. Y. Application filed September 24, 1872.

The stationary hubs are surrounded by friction-rollers, which have conical ends. The tire is so recessed that it has its bearings upon the friction-rollers, and its flanges are prevented from coming into contact with the flanges of the hub.

Claim.—1. In combination with the stationary hub *b*, its outer periphery channeled to receive the friction-rollers *c*, the same having conical ends, of the tire *a*, correspondingly recessed so that the outer edges of the tire shall not come into contact with the sides of the hub, all substantially as shown and described.

2. The construction of a car-wheel with a stationary hub that can vibrate in a horizontal plane to adjust itself to a curve in the manner described.

3. The two parallel-motion bars attached to the opposite sides of the stationary hub of each wheel, and connecting them substantially as shown and described.

138,037.—*Mining-Pump.*—GEORGE E. MILLS, New York, N. Y. Application filed January 13, 1873.

The suction-pipes are provided with sliding sleeves. At proper intervals clamping-bars are attached to the discharge-pipes, and are provided with tapering arbors for the working-beams.

Claim.—1. The two water-reservoirs A A, as constructed and combined with the double cylinders B B, valve-plungers C C, suction-pipes D D, and the movable sleeves E E, substantially as herein shown and described.

2. The clamping-bars H H, tapering arbor *h*, in combination with the vertical tubes G G, through which the water is elevated for constructing the frame of mining-pumps, substantially as herein shown and described.

138,038.—*Toy.*—THOMAS MORLEY, Newark, N. J. Application filed February 21, 1873.

The toy battle-field is provided at each end with a company of soldiers, separately hinged to the said field, and arranged to stand upright and be knocked down by the balls from the cannons opposed to them.

Claim.—1. In a toy battle-field, the figures *a*, representing artificial soldiers, secured by hinges to the field A, in the manner substantially as described, and for the purposes set forth.

2. The combination of the field A, guns C, and artificial soldiers *a*, in the manner substantially as described, and for the purposes set forth.

138,039.—*Breast-Collar for Harness.*—HIRAM B. MORRISON, Le Roy, N. Y. Application filed December 19, 1872.

The clamping-plates are situated on each side of the breast-collar, and are united by the screw which contains the pole-strap ring.

Claim.—The combination of the two clamping-plates C D, situated on opposite sides of a breast-collar, and united by a screw, or equivalent, when the same form a portable attachment, and is otherwise constructed and arranged as herein described.

138,040.—*Ear-Covering for Hats and Caps.*—BENJAMIN R. MORSE, Galesburg, Ill. Application filed March 15, 1873.

A spring-frame is covered and hinged to a metallic plate attached to the cap at the sides thereof, and is capable of sustaining itself up against the side rim or down on the ears.

Claim.—1. An ear-flap for hats or caps, consisting of a spring-frame so attached to a base-plate that it shall remain in two positions, viz., extended over the ear or erect against the side of hat or cap.

2. The ear-flap, consisting of the base-plate B, contractile springs *h h*, extending springs *g g*, and connecting-plate *k*, arranged and operating substantially as described.

138,041.—*Boat-Detaching Apparatus.*—FREDERICK M. MUNGER, United States Revenue Service, assignor of one-half his right to EDWARD L. DEANE, Hampden, Me. Application filed January 13, 1873.

Two stanchions, firmly secured in a boat, (one in the bow and the other in the stern,) have each pivoted to them a lever weighted at its lower end, and its upper end formed into a hook, so that the weight of the lower end keeps this hook pressed against the stanchion, and thus forms a jaw for the reception of the tackle-block, hook, or ring. An independent lever is pivoted to each weighted lever, and connection is made between the independent levers by a rod operated by an upright bar, the said rod running fore and aft in the boat. Thus both weighted levers may be operated simultaneously or independently of each other.

Claim.—1. In a boat-detaching apparatus, the combination of the standard B and lever *c*, having a hook at one end and weighted at the other, with the shoulders *i* on said standards, said parts being so constructed and arranged as to form a jaw, *h*, for the reception of the tackle-hook, solid on both sides and on the bottom, substantially as described and shown.

2. In combination with the above, the levers *d*, rods *g g*, and rocker *f*, substantially as set forth.

138,042.—*Bake-Oven.*—JAMES J. PICCOTT, St. Louis, Mo. Application filed October 18, 1872.

Claim.—1. The bake-oven A, provided with the supports *c c*, in combination with the pan D, provided with the guides *d d*, all arranged and operated as specified.

2. In a bake-oven, constructed and operated as described, a safety-valve, G, substantially as described and shown.

3. In a bake-oven, constructed and operated as set forth, an indicator, H, substantially as described.

138,043.—*Cotton-Planter.*—WHITMAN PRICE, Mount Olive, N. C. Application filed January 31, 1873.

Pivoted inside near the fore part of a quadrangular frame is another frame, having a slight vertical angular motion, in which are pivoted, on one axis, two hollow frustums of cones, their smaller bases closing the ends, their larger ones taken away. Between their peripheries is a flat hook rigidly attached in front and rear to the inner frame. A portion of the hoop is cut out in one place for the exit of the seed. The cones are not in contact with the ground, but have attached to them short radial arms and a hoop which rolls on the ground, carrying with it the cones. An opener is in front and a coverer behind the machine.

Claim.—The annular plate C, provided with the sleeve K, in combination with the vibrating supporting-frame *f* and *f'* and rotating hopper D and D', substantially as and for the purpose specified.

138,044.—*Clothes-Pounder.*—DAVID W. RAWSON, Croydon, N. H. Application filed October 16, 1872.

The tube has a valve near the top. On the under side of the foot are slots. The foot is tapering and has a succession of beads. The tube passes through the foot and serves as a handle.

Claim.—The valve V, in combination with the tube F and the foot D, constructed substantially as and for the purpose herein set forth.

138,045.—*School Desk and Seat.*—ALBERT E. ROBERTS, Des Moines, Iowa. Application filed February 17, 1873.

To the boards of the desk top and back are attached metallic straps, having projecting hooks that engage with corresponding slots in the end frames. The bolt confining the two parts of the seat-joint has a washer of a wrench-shape, the point of which works in a slot on the projecting seat-arm. The projecting arm has also a recess for a rubber cushion, combined with a metallic friction-plate, which is forced outward when the rubber cushion is pressed into the recess, and thereby friction is caused on the seat-frame arm.

Claim.—1. Constructing a school-desk in separate complete movable sections, by means of the metal straps B and C, with the projecting hooks *a a* and the corresponding slots *b b* in the end frame A, substantially as described, and for the purposes specified.

2. Constructing an automatically expansive and contractive hinge-joint for adjustable seats by combining and co-operating the parts D and E by means of a common bolt, the elastic cushion *f*, friction-plate *g*, slot *k*, wrench-form washer *m*, nut *n*, and shoulder *o*, substantially as described.

138,046.—*Bottle-Washing Apparatus.*—FREDERICK SCHLICH and ADRIAN FETH, New York, N. Y. Application filed July 11, 1872.

A number of jet-nipples are attached to a water-pipe, and each is provided with a ring carrying uprights or fingers, which form supports to steady the bottle centrally over the jet-nipple.

Claim.—The bottle-washing apparatus, made of the jet-nipples *a*, and bottle-supporting fingers *d*, arranged in the manner and for the purposes specified.

138,047.—*Revolving Fire-Arm.*—GEORGE W. SCHOFIELD, United States Army. Application filed March 21, 1873.

Claim.—1. The combination of an extractor having a hollow or tubular stem and a spring having suitable stops or abutments arranged within said stem, the combination being and operating substantially as set forth.

2. A hollow extractor-stem having slots *e e*, the spring-stop described, spring, and the shoulders *u*, when combined for operation as and for the purposes described.

3. The combination of the extractor-stem, lifter, and lifter-catch, said catch being provided with ears *k k*, so that it may be thrown out of catch with the lifter, as desired, and as specified.

4. In combination with the hammer R and the hand D pivoted thereto, the crank O, and the nose *w*, and slot *s* for revolving the cylinder, substantially as described.

5. In combination with the hammer, hand, and crank, the recoil-plate interposed between the head of the crank or the crank-arm and the ratchet or semi-clutch on the shank or axle of said crank, so as to rotate the cylinder and at the same time cut off all escape for the gas between the cylinder and the lock mechanism, substantially as described.

138,048.—*Strike or Keeper for Door-Locks.*—JOHN SCOTT, Philadelphia, Pa. Application filed March 1, 1873.

A bolt, connected to a sliding block by means of a pivoted lever, is arranged within the strike or keeper so that the sliding block will be forced back and the bolt thrown into a recess in the lock-case, when the lock-bolt is thrown forward. The bolt in the keeper is provided with a rack, in which engages a pawl, for the purpose of holding it in the locked position. This pawl is attached to the inner end of a knob-shaft, and is released from the bolt by turning the knob, when the bolt will be withdrawn by a spring arranged for that purpose. To prevent the knob from being turned and the pawl released, another pawl, pivoted to the outside of the keeper, may be made to engage with the ratchet-teeth on the knob-shaft.

Claim.—1. The bolt box or keeper G of a lock constructed as described, and with the pawl *q*, spring S, knob K, rack *r*, bolt *d*, block *b'*, and lever D, applied within it, in combination with a lock, A *b*, which has passages for independent bolts from and into it, substantially as described.

2. The combination of the exposed pawl *h'*, and ratchet *h*, and the internally-located pawl *q* with the rack *r* on bolt *d*, the latter being connected to the block *b'*, substantially as described.

138,049.—*Baluster for Iron-Bridge Railings.*—SAMUEL SELLERS and MARCUS M. MANLY, Philadelphia, Pa. Application filed January 29, 1873.

Balusters of bridge-railings, made of rolled iron or steel, of ✳, H, or + section, plain or twisted, to give increased tightness and ornamental appearance, combined with strength.

Claim.—As a new article of manufacture, the balusters of bridges and other railings, made of rolled mouldings and of rolled flanged iron or steel, substantially as specified.

138,050.—*Device for Cooling Millstones.*—EDWARD D. SHANTON and SILAS SHAVER, Minneapolis, Minn. Application filed December 17, 1872.

A circular box, having a feeding-tube and an air-conducting tube, is set in the eye of the upper stone. The box has also a flap-valve for letting air into the eye of the millstone when, from any cause, the current of air being forced through the air-tube is stopped. A conical flange on the feeding-tube will, when the millstone is stopped and the current of air through the air-tube not stopped, prevent blowing out of the eye of the stone the grain that has passed through the feeding-tube.

Claim.—1. The box B having the flap-valve *b''*, in combination with the feeding-tube *a*, constructed, arranged, and operating substantially in the manner described.

2. The box B having the air-inlet tube *b'*, in combination with the feeding-tube *a* having the projecting conical flange C, constructed, arranged, and operating substantially as and for the purpose described.

138,051.—*Fire-Escape.*—GEORGE H. SHAW, Phelps, N. Y. Application filed February 11, 1873.

A friction-block, sling, and strap controlled by a friction-screw brake, for affording a retarded descent from the windows of burning buildings.

Claim.—The block C, having grooved cross-bolt *a*, friction-bolt *b*, and clamp-piece D, controlled by the thumb-screw F, adapted to be used in combination with the strap A and sling G, when arranged substantially as set forth.

138,052.—*Pocket-Knife.*—HENRY STAUDE, Troy, N. Y. Application filed December 30, 1872.

A screw-bolt and nut, such as is used in carpenters' saws, confines the blade of the pocket-knife. By means of this device a broken blade can be readily removed and a new one inserted.

Claim.—1. In combination with the handle and blade of a knife, the detachable screw-bolt and nut, all arranged as and for the purposes set forth.

2. In a knife-handle, the construction of the spring and detachable blade, as described, in combination with a removable screw-bolt and nut, substantially as and for the purposes set forth.

138,053.—*Instrument for Drawing Scrolls.*—EDWARD E. STEBBINS, Meadville, Pa. Application filed December 12, 1872.

The upright leg or staff of the instrument is provided with a right and left screw, upon the upper of which a nut or head is carried, to which the drafting-leg is hinged, while upon the lower screw-thread a sleeve is carried, to which an arm is pivoted, as well as to the hinged leg, thus forming therewith a kind of toggle-joint. As the hinged drafting-leg is moved around the stationary upright leg it is caused to approach to or recede from it by the conjoined action of the reversed screws.

Claim.—An instrument for drafting scrolls, with a center-rod, A B, with a right-and-left screw thereon, in combination with the collars D C, the rod S, and the leg L jointed to the screw-head H, all constructed as described.

138,054.—*Curtain-Fixture.*—THOMAS SYMONDS, Portland, Me. Application filed February 6, 1873.

A frame to support the curtain-rollers, made of wire, having a spiral spring at the two corners and eyes or loops at the two ends. The curtain-cords are attached to the wire at the spiral corners, and the frame is attached to the ends of the curtain-roller by means of the end eyes.

Claim.—The detachable wire-frame *c* with spring-corners, and eyes at the ends, as and for the purposes described.

138,055.—*Implement for Rolling, Guiding, and Controlling Barrels, &c.*—BENJAMIN V. TAMPLIN, Peoria, Ill. Application filed March 15, 1873.

The blade has a beveled edge transverse of the handle, one on either side elongated at right angles from the chisel-edge and parallel with the handle, and designed to catch the chimes of the barrel to turn the course of the same in rolling, the chisel-edge being used to obtain a hold on the bilge of the barrel in rolling it forward.

Claim.—1. An implement or tool for rolling barrels or casks having a chisel shape and a similar beveled edge, whether serrated or curved between the outer corners, with a lateral hook, *c*, on one or on either side, or on both sides of the blade B, substantially as and for the purposes described.

2. The implement for rolling, checking, and turning barrels or casks, having a straight chisel-edge, *a*, in combination with a lateral hook, *c*, forming part of the same, set in the handle A, substantially as described.

138,058.—*Spring Bed-Bottom.*—SILAS A. THOMPSON, Manchester, Mich., and CHARLES T. KENDRICK, Brooklyn, N. Y. Application filed April 16, 1873.

The springs are held to the cross-bar by a grooved plate or washer, and to the slats by a flat hook. The head-elevator is pivoted to the under side of the side rails and hinged to the top of them. Cords are run through the upper and lower bars, which are grooved, and it is held to an inclination by ratchet and pawl.

Claim.—1. The washer E with its two side grooves, for clasping over the contiguous arms of the springs, with a tooth upon one end, and held to the bar by means of a screw, as described.

2. The spring-holder D, made of band-iron or other flat metal, and forming a reversible hook, in combination with the mortised slat C, spring O, and washer E, as described.

3. The head-elevator or invalid attachment, fastened to the side rails of the bed-bottom by the castings and to the upper edge of the rails by the hinges, with a cord passing through the holes in the grooved pieces, and having the webbing, pawl, and ratchet, which engage with a pin driven in the side rails, as described.

4. The combination of the slats with the grooved washer for fastening the springs, the pin, the hook, or loop, the invalid attachment with the grooved head-piece and cross-bar, the webbing, cord, ratchet, and pawl, all constructed as described, and for the purposes set forth.

138,057.—*Sash-Holder.*—LYMON A. TUTTLE, Berea, Ohio. Application filed March 3, 1873.

A friction-plate sash-holder, slotted to form two angular-inclined planes, is combined with an eccentric cam, which has a convenient handle, and is secured to the sash by means of a screw passing through it and into and through the slot, the cam working on this screw as a pivot, while the screw at the same time serves to attach and hold the combined device in position.

Claim.—The plate A, slot B, and incline planes F G, as arranged, in combination with the cam C working on the screw *a*, substantially in the manner as described, and for the purpose set forth.

138,058.—*Machine for Pointing Spikes.*—JAMES WALDRON and DOUGLASS G. MOORE, Elizabeth Port, N. J. Application filed October 7, 1872.

Claim.—In a rotary machine for the fabrication of spikes and other similar articles from bars of metal, the combination of two shaping-rolls, C D, having the shaping-surfaces of their peripheries both concentric with and eccentric to their axes, substantially as described, and each roll having upon its periphery, and forming a part of itself, friction driving and guiding gears *b b c c*, whereby the said rolls are both rotated and guided, substantially as and for the purposes described.

138,059.—*Lifting-Jack.*—HENRY H. WARREN, Buffalo, N. Y. Application filed January 22, 1873.

Claim.—1. The standard A having double slots or openings B B, bearing-pins *c c*, and the catches or lugs *a b* or their equivalents, in combination with the lever C and pawl F, all arranged and operating substantially as described.

2. In combination therewith the button or catch *g*, toe *d*, recess *e*, and loop *f*, arranged and operating as and for the purpose set forth.

138,060.—*Apparatus for Drying Painted Wire-Cloth.*—CHARLES H. WATERS, Groton, Mass. Application filed February 28, 1873.

The skeleton-cylinder is provided with a hollow perforated shaft, through which is passed the artificial current of air for drying the painted wire-cloth.

Claim.—The method of drying painted wire-cloth or other reticulated fabric by winding it into a cylinder and passing an artificial current of air through the meshes thereof, as described.

138,061.—*Scissors.*—AMOS WHITTEMORE, Cambridgeport, Mass. Application filed October 9, 1872.

Additional cutting-edges are furnished upon the inner side of the fulcrum or pivoted point. When the scissors are held in the left hand for cutting the nails of the right the pressure of the thumb in the bow forces these cutting-edges more closely together, whereas this same pressure would force the regular cutting-edges beyond the pivot, further apart upon the outer sides of the blades. Near the bows are placed curved points for cleaning the nails.

Claim.—1. The cutting-edges *a a'* combined with the cutting-edges *b b'*, substantially in the manner and for the purpose described.

2. The curved edges *i*, terminating in cleaning-points *g*, substantially as described.

138,062.—*Railroad-Car Heater and Ventilator.*—CHARLES F. WHORF, St. Louis, Mo. Application filed December 19, 1872.

The inner air-heating chamber about the stove is supplied with air from outside. The top pipes pass through the outer chamber and deliver the heated air into the car. In these pipes are openings, controlled by valves, to regulate the flow of hot air. The outer air-chamber, taking the air of the car through the perforations in its base, delivers it outside through the cowl.

Claim.—1. The combination of base B, the heater A, and casing C, the base having the central opening *a* communicating with the outer air, and with the chamber formed between the heater A and casing C, this chamber being provided with apertures discharging into the car and into the ventilating-shaft, the discharge being regulated and controlled by dampers, as described.

2. The combination of the base B provided with openings *d'*, with the chamber between the casings C and D and the ventilator-shaft, by which means impure air is drawn from the room and discharged into the open air, as described.

3. The combination of base B, rims *b b'*, opening *a*, orifices *d'*, casings C and D, tubes or pipes E, dampers *e*, ventilating-shaft F, when arranged to operate as and for the purpose set forth.

138,063.—*Shoemaker's Finishing-Tool.*—WILLIAM WILSON and JOHN FOSTER, Charlton, Iowa. Application filed October 11, 1872.

The collocation, in a hand-tool, of the various devices requisite for setting the edges and burnishing the soles and heels of boots and shoes.

Claim.—1. The adjustable guard C carrying the shank-wheel *d* and fudge-wheel *f* and stamp *g*, when combined and operated with the fore-part iron B and handle A, substantially as described, and for the purposes specified.

2. The adjustable guard A carrying the seat-wheel *k*, when combined and operated with the heel-iron G and shank-iron H and handle A, substantially as described, and for the purposes specified.

138,064.—*Hammer.*—ENOCH S. YENTZER, Ottawa, Ill. Application filed February 11, 1873.

A blank of peculiar form is cut from a sheet of metal and then bent to form shoulders and scrolls, as shown. The long portion of the blank forms the spring-shank, and is secured to the presser. The stop which projects from the spring-arm regulates the position of the hammer with reference to the bottom of the presser.

Claim.—1. The hammer constructed and operating as herein specified, supported on the spring-shank, and adapted for application to the pressure-foot of a sewing-machine, in the manner set forth.

2. The combination of the flexible pressure-regulating stop *g* with the described hammer and spring-shank and the pressure-foot, in the manner set forth.

138,065.—*Weather-Strip.*—JEROME BACON and GILBERT BACON, Medina, Wis. Application filed February 15, 1873.

Claim.—The triangular pieces A B hinged together and having spring D, rubber E *g*, and hook J, combined and arranged on a door with the lug I, as and for the purpose described.

138,066.—*Nut-Machine.*—JOHN BRAUN, Philadelphia, Pa., assignor to GOODELL, BRAUN & CO., same place. Application filed January 4, 1873.

The punch that cuts the blank from the bar acts simultaneously with the center punch. A horizontal bar is made adjustable as to height so that a discharging-pin in the punch will, as the latter rises, strike the bar and eject the nut, no matter what may be its thickness.

Claim.—1. The sliding pins *z*, in combination with the die-piece E, slotted at *g*, and the stop-bar G, substantially as and for the purpose specified.

2. The combination of the die-piece E, slotted at *g*, and holding the sliding plus *z* and die-socket *k*, with the horizontal stop-bar G, bolts *m*, and springs *n*, substantially as and for the purpose specified.

138,067.—*Machine for Making Machine-Screws.*—JOHN BRAUN, Philadelphia, Pa., assignor to GOODELL, BRAUN & CO., same place. Application filed January 4, 1873.

Cutters for milling the end of the rod, and dies for threading the same, are arranged in a rotatable disk, which, together with a knife-operative by a hand-lever for cutting off the finished screw, is supported by a frame which is moved to feed, as the work progresses, by two feed-screws, through the medium of two portable sectional nuts or tongs. At the termination of the threading operation the end of the screw forces back a plunger that releases a latch upon the tongs, and allows them to open and disengage the nuts with the screws.

Claim.—1. In combination with the worm-shaft B B, the feeder D, substantially as shown and described.

2. The tongs F, constructed and arranged substantially as set forth.

3. In combination with the tongs F, the sliding shaft e^2 for automatically unlocking said tongs, as described.

4. The combination of the hollow revolving shaft *e'*, the worm-shafts B B, the tongs F, sliding shaft e^2, and frame E bearing the cutting-tool and die-disk, substantially as described.

5. In combination with the block K and shaft L, the plunger *m*, substantially as shown.

6. In combination with the plunger *m*, the lever N, substantially as described.

7. In combination with the shaft L, arranged to operate as shown and set forth, the hollow shaft *e'*, as shown.

8. The combination of the block K, shaft L, plunger *m*, and lever N, substantially as shown and set forth.

9. The combination of the base-piece A^1, slide D', and standard O^2 with the frame E, having the die-disk and cutting-tool, and the tongs F.

10. The combination of the base-piece A^1, slide D', and standard O^2 with the block K, shaft L, plunger *m*, and lever N.

138,068.—*Boiler Fire-Extinguisher.*—JOHN D. BERENHAN, Montgomery, Ala. Application filed February 8, 1873.

When the fire is to be extinguished the valve is opened, and water from the water-space is allowed to run into the furnace.

Claim.—1. The tube C, with perforations *b* and aperture *a*, in connection with the bolt and valve D *c*, substantially as and for the purpose described.

2. The tube C provided with a bolt, and valve D *c*, and perforations *a b*, in combination with the furnace or fire-box of a boiler, and the steam and water space formed contiguously thereto between the sheets of the boiler, as shown and set forth.

138,069.—*Corn-Stalk Knife.*—JOSEPH M. BRICK, Marlton, N. J. Application filed March 1, 1873.

The blade of a corn-stalk knife, near its point, is bent upward from its horizontal plane, and also outward from its vertical plane, so that it will give a draw cut at every blow, and at the same time cut with an upward oblique action without forcing the stalks away from it.

Claim.—A corn-stalk knife which has its blade near its point bent upward from its horizontal plane, and also outward from its vertical plane, as herein described and shown.

138,070.—*Lamp.*—GEORGE BROWNLEE, Princeton, Ind. Application filed February 8, 1873.

An eccentrically-weighted valve, which may be unseated by the pressure from within or by inclining or jerking the lamp, releases a wire spring which carries the extinguisher-tube over the flame. The tension of the spring is regulated by a set-screw.

Claim.—1. A weighted valve, C, having the extension *e* applied to an aperture in the plate *d* over the body A, as and for the purpose described.

2. The lever-arm of valve C, having upward projection *g* and lug *h*, combined with the spring D and notch K of casing, as described, to form a connection between valve C and sliding extinguisher F, as and for the purpose set forth.

3. The screw-regulator G *m* applied to the spring D, as and for the purpose specified.

138,071.—*Iron Fence-Gate.*—CLARK T. BUSH, Oneonta, N. Y. Application filed December 6, 1872.

A continuous piece of iron, looped over the upper hook in the gate, passes thence to the latch-end, turns down to its base line, and is there turned toward the lower hook, around which it is looped. Another piece is looped over said lower hook and passes diagonally to the top front, where it is embraced, with the horizontal part of the continuous bar described, within a movable sleeve, by which this bracing is adjusted. The pickets are supported upon this skeleton frame by means of tongues and loops belonging to said pickets.

Claim.—The gate consisting of the single bar H, pickets P P, and adjustable brace-rod B provided with an eye to fit upon the lower gate-hinge, and secured at the upper end by the adjusting-band *n*, substantially as described and shown.

138,072.—*Work-Stand.*—CHAUNCEY S. CAPLE, Frankfort, N. Y., assignor to himself and WILLIAM GATES, same place. Application filed March 15, 1873.

The small central stand has in its bottom a slotted plate, said slot engaging with a pin made adjustable by a lever and spring, which are placed in the top of the main stand.

Claim.—The disk Q having hole R and the slot T, the pin S, spring U, and lever V combined with a stand, N, and a table-top, as described.

138,073.—*Adjustable Sewing-Machine Chair.*—FRANKLIN CHICHESTER, Milwaukee, Wis. Application filed February 15, 1873.

The inclination of the chair is adjusted by the latches attached to the pivoted cross-bar engaging with the notches in the side plates below the chair-seat. The back-frame is pivoted to the arms, and the inclination of said back-frame is adjusted by latches attached to the front of said arms and engaging with notches on the upper edge of the side plates of the chair. Coiled springs throw both the seat-frame and the back-frame forward when not locked in position. The back is pivoted to the back-frame, and is thrown forward by springs coiled about the pivots.

Claim.—1. The combination of the adjustable latches G, side plates E, and coiled springs H with the armed cross-bar C and the chair-seat F, substantially as herein shown and described.

2. The combination of the socket P, pivot Q, and coiled spring T with the parts N O of the chair-back, substantially as herein shown and described.

3. The combination of the coiled springs J, pivoted bars K, and latches M with the plates E, chair-seat F, and pivoted chair-arms L, substantially as herein shown and described.

138,074.—*Oiling Millstone-Spindles.*—JOHN J. CHUBB, Decatur, Ind., assignor to himself and SAMUEL C. BOLLMAN, same place. Application filed March 8, 1873.

Claim.—1. The tube D, embedded in a channel in the leading furrow of the stationary stone A, and extending from the heel or skirt to the bosom of said stone, substantially as herein shown and described.

2. The tube E, provided with an oil-cup, F, in combination with the hoop or curb B, the tube D embedded in the stationary stone A, and the spindle C, substantially as herein shown and described.

138,075.—*Friction-Clutch Mechanism.*—JOHN J. COBURN, Philadelphia, Pa., assignor of one-half his right to HUGH B. COYLE. Application filed March 22, 1873.

For preventing wear of frictional surfaces of parts composing the friction-clutch mechanism.

Claim.—1. In the clutch mechanism, as described, the removable steel shoe inserted within the cavity and upon the bearing-surface of the rollers or equivalent, as and for the purpose set forth.

2. The combination of the cup, disk, rollers, steel shoe, spring, and shaft, substantially as described.

138,076.—*Snow-Shovel.*—HENRY C. COLE, Wallingford, Vt. Application filed March 8, 1873.

A shovel fortified at the side by introducing a U-shaped metallic plate.

Claim.—The shovel A fortified by U-shaped plates of metal running the whole length of edges, as and for the purpose described.

138,077.—*Combined Stop-Cock, Check-Valve, and Blow-Off.*—ELDRIDGE G. CUSHING, Oswego, N. Y. Application filed February 1, 1873.

The body having a hollow tapering plug in which is a check-valve sliding on a stem; also, having three openings, and may be used as a stop cock and blow-off.

Claim.—The shell A having the inlet, outlet, and blow-off-pipe connections B C C', the hollow plug D having openings E F F', valve-seat G, and chambers H I, and the valve J, having rotary handle M, all constructed, arranged, and combined substantially as and for the purpose described.

138,078.—*Lifting-Jack.*—WILLIAM M. DOTY, New York, N. Y. Application filed March 15, 1873.

Three, more or less, lifters on the bar are arranged so as to be nearly over the center of gravity when either one of them is employed, adapting the jack for all kinds of vehicles, the axles of which vary from one to two feet, or more, in height from the ground.

Claim.—1. A friction-spring, substantially as shown at I, for supporting the lifting-bar, as shown and described.

2. A lifting-jack, consisting of the base A, stand B, lifting-bar C, link D, lever E, fulcrum-bars F, and friction-spring I, arranged to operate as and for the purposes described.

138,079.—*Machine for Molding the Edges of Marble Slabs.*—JAMES FINN, Boston, Mass. Application filed May 2, 1872.

Claim.—In the marble-grooving machine described, the combination of the longitudinally-reciprocating and rotary grinding-cylinder D with a single horizontal carriage, B, and mechanism, as described, for automatically moving such carriage toward the grinder while the latter may be in operation.

138,080.—*Mill-Pick.*—E. STOWE FORGY, Dayton, Ohio. Application filed February 8, 1873.

The blade is readily removable, but when in use is held rigid and immovable.

Claim.—1. The curved clamp-plate C, applied within the socket of head A and against the pick D, as and for the purpose set forth.

2. The head A having projection D and socket I, and the curved clamp-plate C having swiveled screw E, combined with pick D G, as and for the purpose specified.

138,081.—*Gate-Hinge.*—WILLARD G. FRANKLIN, Shelbina, Mo. Application filed November 30, 1872.

The eye-piece of a gate-hinge, constructed with three or more pintle-holes, is provided with a screw-shank and head or shoulder piece to attach it to the gate-post. The gate-piece of the hinge is slotted lengthwise, forming semicircular notches, through which fastening-bolts pass, and these being loosened permit a sliding adjustability, this construction allowing the gate to swing level or to tilt upward in swinging back according to the manner in which this compound hinge is adjusted.

Claim.—A gate-hinge, consisting of screw-shank D, shoulder-plate E, eye-plate F having a series of holes, and adjustable gate-piece G, combined and applicable, as and for the purpose described.

138,082.—*Liquid for Heating by Means of Pipes, &c.*—LOUIS GRIMM and JOHANNES CORVIN, Magdeburg, Prussia. Application filed March 14, 1873.

A fluid consisting of glycerine and chloride of calcium or equivalent.

Claim.—The herein-described fluid, consisting of glycerine and chloride of calcium, or its equivalent, in the manner and for the purposes substantially as hereinbefore set forth.

138,083.—*Invalid-Bedstead.*—GORHAM WHITCOMB GROTE, St. Catharine's, Canada. Application filed January 20, 1873.

The mattress-frame is made in three sections, the upper section hinged at its inner end to a cross-bar rigidly attached to the sides of the couch-frame, the inner section hinged to said rigid bar and to the lower section. These sections are adjusted by means of bars connecting with screw-shafts at each end of the couch-frame. Beneath the central section and attached thereto is a bed-pan adjuster. Above the mattress-frame is arranged a canvas stretcher made in three sections corresponding to the mattress-frame and united to it at the lower end by a hook, hinge, or connection; the upper end is adjusted by means of an eccentric lever pivoted to the center of the head-section, and bearing on the head-section of the mattress-frame.

Claim.—1. The couch proper, combining the frame A A, sectional mattress-frames B, D, and E, and adjusting screw-shafts G G, nuts, and connecting-bars F F, as and for the purpose hereinbefore set forth.

2. The bed-pan adjuster H L N I, including pan and pad, combined with and attached to sectional mattress-frame D, as and for the purpose hereinbefore set forth.

3. The upper frame or canvas stretcher with its sections P, Q, and R, (corresponding with sectional mattress-frames B, D, and E,) and draw-bolt *w*, provided with adjusting eccentric lever T and guide-bolt X, and combined with and attached to sectional mattress-frame at foot end of section E by adjustable hinges V V, as and for the purpose hereinbefore set forth.

138,084.—*Watchman's Time-Check.*—THEODORE HAHN, Stuttgardt, Germany. Application filed February 15, 1873.

The paper dial of the portable time-marker is provided with concentric circular lines, crossed by obliquely-curved lines, repre-

centing the play of the piercing-arm, which is jointed transversely to its pivoted motion. Different keys are so related to this jointed arm as to cause it to pierce the paper dial at any indicated time on different points in the curved graduations.

Claim.—1. The rotary dial D, made with the concentric annular subdivisions and with cross-lines curved on a radius equal in length to the pivoted carrying-arm of the piercing-tool, substantially as described.

2. The pivoted arm F of the piercing-point a, arranged below the plate C and jointed to be horizontally as well as vertically flexible or movable, as described.

3. The curved slotted supporter H applied above the rotary dial D and above the piercer of the jointed pivoted arm F, substantially as described.

4. The tool-arm F, provided with the pendent plate *g* and lug *h*, as specified.

138,085.—*Cultivator.*—JACK HELM, Hochheim, Tex., assignor to himself and CHARLES TIMM, same place. Application filed November 16, 1872.

The two parts of the evener are connected by an arch.

Claim.—The connected eveners C C, attached to the end of gang-plow frames by rings D, and to the sides of said gang-plows by the jointed rods F F, as and for the purpose described.

138,086.—*Paper-File.*—ROBERT HENNING, Ottawa, Ill., assignor to himself and J. D. CATON, same place. Application filed February 3, 1873.

The paper-hook depends from a bracket, to which is hinged a weighted lever bearing upon the hook-point.

Claim.—The hinged guard-lever B, combined with the paper-file plate A, having the rests *a e* arranged as and for the purpose described.

138,087.—*Thill-Coupling.*—GEORGE W. HOBART, Lowell, assignor to himself, JEROME B. MELVIN, Tewksbury, and JAMES H. PINDAR, Lowell, Mass. Application filed August 31, 1872.

A loop is attached to the axle, a draft-rod in form of a loop, or rod with enlarged head connects the thill and axle as a substitute for a leather strap commonly used to guard against accidents.

Claim.—The loop on the yoke C, in combination with the draft-rod D or the loop L, substantially as and for the purpose herein described.

138,088.—*Milk-Cooler.*—WILLIAM HODGDON, North Craftsbury, Vt. Application filed March 15, 1873.

A large water-pan divided into four compartments with a separate water-supply pipe for each, and a discharge-pipe connection of each with a main waste-water pipe. Each milk-pan has a separate discharge-pipe.

Claim.—The water-pan A with separate bottoms B, a special supply and exhaust pipe for each compartment, pans E, and a special discharge-pipe, J, for each pan, all constructed, combined, and arranged substantially as specified.

138,089.—*Churn.*—WILLIAM H. HOLDAM, Crab Orchard, Ky. Application filed March 1, 1873.

A perpendicular cylinder, an extensible concentric inner cylinder, open below and above, a revolving dasher-shaft with broad concave-convex blades obliquely set.

Claim.—The dasher F G, adjustable curbs H I, and radial flanges or block J, in combination with each other and with the churn-body E, substantially as herein shown and described, and for the purpose set forth.

138,090.—*Loom for Weaving Wire.*—SAMUEL HOLDSWORTH, Maspeth, assignor to himself and JAMES BLACK, Brooklyn, N. Y. Application filed January 18, 1873.

The weft-wire is beaten up by a series of blades which are actuated successively by a rotating roller having two spiral reversed cam projections, one actuating them from right to left, the other from left to right, according as the shuttle is thrown. The shuttle has a T-projection on the side, which runs in a corresponding way formed in a series of thin vertical plates, between which the warp-wires pass, and it is reciprocated by means of pins arranged spirally on a reciprocating drum, which pins engage in a diagonal groove in the bottom of the shuttle. The heddles are operated by means of a weighted arm, which is raised positively to a vertical position, and is then allowed to fall a limited distance, sufficient to complete the shed.

Claim.—1. The combination, with the blades A, of the rotating cam-roll D, having reverse cams, substantially as specified.

2. A shuttle-driver, consisting of a rotary reciprocating roller, having a spiral row of pins engaging an oblique slot in the shuttle, substantially as specified.

3. The combination of the stationary plates K, shuttle G, and shuttle-driving roller L, having the pins M arranged spirally, substantially as specified.

4. The combination of the oscillating-shaft A', arms V V, weighted arm B', and a device for actuating the latter with the harness, substantially as specified.

5. A shuttle-driving roller, provided with pins, arranged in the planes of the plates K, as and for the purpose described.

138,091.—*Carriage-Axle Box.*—JOSEPH JONES, JAMES DUNKERLEY, and JOSEPH DUNKERLEY, Paterson, N. J. Application filed December 31, 1872.

To keep sand and dirt from entering the axle-box, and to keep the same thoroughly lubricated.

Claim.—The combination of the axle-arm A, axle-box B, perforated screw D, and hollow screw-cap E, constructed to operate substantially as herein shown and described, and for the purpose set forth.

138,092.—*Lock-Hinge.*—MORTIMER C. LEE, New York, N. Y. Application filed March 29, 1873.

The pintle-leaf of a hinge is provided with two shoulders or foot-holds on its socket, serving as ratchet-teeth; a pawl is pivoted to the opposite leaf in such manner as to drop down automatically into one or the other of these shoulders when the hinge is opened, locking it firmly in position, the double shoulder serving to adapt the fastener to either side of the blind or window, making the hinge reversible. The pawl and projection-plate may be made unattached so as to apply the device detachably to an ordinary shutter-hinge.

Claim.—The pintle portion E of a lock-hinge, provided with the shoulders G G on its upper side adjacent to the pintle F, whereby it is adapted for use on either side of a window, and to co-operate with the leaf D and pawl H, as specified.

138,093.—*Cooking-Stove.*—DENNIS G. LITTLEFIELD, Albany, N. Y. Application filed February 19, 1873.

Metallic strips depend from the under side of the oven-plate into the flues for products of combustion to deflect the heat outward, and cause it to be evenly distributed. The damper has its seat on the rear of the top oven-plate.

Claim.—1. The deflecting-strips G G, in combination with the flues C C and D, as and for the purpose specified.

2. The combination of the strip F and deflecting-strips G G with the flues C C and D, as and for the purpose specified.

3. The damper-seat I, constructed and arranged so as to rest upon the oven-plates, as herein shown and described, to form a support for the top of the stove.

138,094.—*Egg-Beater.*—NATHANIEL C. MILLER, Stroudsburg, Pa. Application filed February 28, 1873.

To the frame is attached a cogged hand-wheel and a pinion, A wrist-pin is attached to the pinion, and the slotted end of the beater-bar moves on said wrist-pin, giving the beater-blade a vibratory motion.

Claim.—The arrangement of the pinion B and its wrist-pin C with the beater-bar A, in combination with the hand-wheel D, frame F, and beater H, substantially as shown.

138,095.—*Refrigerator.*—DENNIS MULCAHY, Boston, Mass. Application filed February 15, 1873.

The refrigerator is arranged to allow a free circulation of air between its parts, and the removable drip-pan D has a glass indicator to show the height of water in the pan.

Claim.—1. The combination and arrangement of the ice-chambers A, wire-bottomed drawers B B, and portable cistern D, substantially as and for the purposes described.

2. A portable cistern, furnished with an index-glass, and forming a part of the refrigerator, substantially as described, for the purpose described.

138,096.—*Fire-Proof Floor and Chimney Connections.*—WILLIAM NERACHER, Cleveland, Ohio. Application filed March 1, 1873.

The ends of the beams next to the chimney are incased in metallic sockets, and the spaces between the joists and the sides of the sockets next the fire are filled with cement or other non-conductor of heat. The hearth is supported by metallic bars, which rest on ribs or flanges on the sides of the socket-pieces.

Claim.—1. The combination, with the joists and chimneys, of metal socket-pieces C or D, and cement or other filling in the spaces between the joists and the sides of the socket-pieces next the fire, substantially as specified.

2. The combination, with said metal socket-pieces, of ribs I and bars K to support the hearth, substantially as specified.

138,097.—*Neck-Tie.*—REGINALD R. PARKER, Indianapolis, Ind. Application filed March 1, 1873.

The neck-tie shield instead of being covered on both sides with the fabric is covered only on the front side, the ends of the fabric being then folded over onto the under side of the shield in triangular pieces at its ends.

Claim.—1. A neck-tie having the points C C covered by folded-down triangular pieces E and H, substantially in the manner described.

2. The triangular piece E, in combination with the shield A, as and for the purpose set forth.

138,098.—*Miner's Bar.*—RALPH B. PLATT, Hazleton, Pa. Application filed January 11, 1873.

A crow-bar, one end of which is a steel point, the other a copper tamping-bar.

Claim.—1. A miner's bar with a crow or pick bar formed at the top, and to which miner's tools or points of the different forms used are detachably connected, substantially as specified.

2. A copper tamping-tool, E, provided with a steel shank, as shown and described.

138,099.—*Bolt Mechanism for Prison-Doors.*—THOMAS R. PULLIS and JOHN PULLIS, St. Louis, Mo. Application filed March 8, 1873.

The traveling bar is operated by a screw-wheel, and has pivoted thereto a series of arms, to each of which is attached a friction-roller, which, when the bar is moved in one direction, will close and fasten the cell-doors. The pivoted arms are locked in a position parallel with the traveling bar by means of padlocks, and by removing any one of the padlocks the arm to which it is attached may be swung outward, and the door opened without moving the traveling bar.

Claim.—The traveling bar B with lugs *a* and *c* having pivoted and connected therewith arms C and friction-rollers D in connection with screw-wheel E, applied as described.

138,100.—*Machine for Dressing Stone.*—GEORGE R. RAY, Bridgeport, Conn. Application filed August 3, 1872.

Cutters or chisels, in a rotary cutter-head, which is mounted on a support on the ends of radial arms, by which it is adjusted vertically to the work which is automatically fed along under the cutters; and the said cutter-head is caused to traverse laterally on its support by a feed-screw, and the radial frame is adjusted vertically by screws geared with a worm-shaft for turning these said screws, the worm-shaft being mounted on bearings so pivoted as to allow the screws to oscillate while working in nuts pivoted to the radial frame to admit of the vibration of the screw necessary for the working of the radial frame.

Claim.—1. The cutters J, secured in the cutter-head by the plates *i k*, wedges *m n*, and the screw-threaded extension of one of the wedges and a nut, substantially as specified.

2. The arrangement of the annular space *p* in the bearings of the cutter-head, and the oblique scrapers *t* on the latter in said space to exclude the grit and dust, substantially as specified.

3. The combination of the water-pipe A', nozzles B', and a flexible pipe, C', with the rotary chisels and the oscillating frame F arranged for discharging water-jets upon the stone where the tools act upon it, and at the same time, substantially as specified.

138,101.—*Machine for Paring Horses' Hoofs.*—GEORGE W. SCHAFER, St. Charles, Mo. Application filed September 7, 1872.

A circular plate or frame and cross-bar having a knife and operating-lever attached thereto.

Claim.—A machine for paring the hoofs of horses, consisting of the circular plate A, bar B, knife-blade C, handle or lever E, pivot-bolt D, stud-bolt F, and handle G, arranged substantially as shown and described.

138,102.—*Blacking-Box Cover.*—JUSTIN B. SHALER, Brooklyn, N. Y. Application filed April 4, 1873.

The cover has a detachable perforated disk inside for holding a wet sponge.

Claim.—The blacking-box cover *a* containing the sponge, or its equivalent, in combination with the perforated plate *c* held in place by lugs *e*, substantially as shown and described.

138,103.—*Scroll-Saw.*—HEZEKIAH B. SMITH, Smithville, N. J. Application filed March 29, 1873.

The saw and saw-table are both simultaneously adjustable to suit the curved lines of the work.

Claim.—The combination of the gear-wheels M N P Q and rods O R or equivalent gearing with the sliding rods G and table S, substantially as herein shown and described, and for the purpose set forth.

138,104.—*Music-Notation.*—EBENEZER P. STEWART, Cotton Plant, Miss. Application filed December 31, 1872.

Music written in figures which indicate the length of tone, and canceled notes or figures for pauses, or, rather, rests, so that each canceled note will indicate the position and length of rest to be produced.

Claim.—In a system of music-notation, the method herein described of indicating rests by canceled notes or figures, substantially as shown and described.

138,105.—*Seed-Planter.*—ISAAC T. SUGGS, Greene Hill, Tex. Application filed November 25, 1872.

A corn or cotton planter on one running-wheel, which, by a rod and cranks, as also by tappets at the opposite end of the axle, works the hopper mechanism. The front of the frame has a harrow pivoted thereto at its rear, and has handles and a coverer behind.

Claim.—A harrow, C, combined with a beam, B, pivoted at its rear end to the front of a seed-planter, as and for the purpose described.

138,106.—*Hedge-Trimmer.*—SAMUEL B. TURNER, Adams county, Ill. Application filed October 5, 1872.

The finger-bar is adjusted to cut at different angles by a weighted lever fulcrumed on an upright attached to the main frame.

Claim.—The arm N, weighted lever O, and standard P, in combination with the swinging sickle-bar E, substantially as shown and described.

138,107.—*Button.*—FRANK WASHBOURNE, Brooklyn, N. Y. Application filed November 4, 1872.

The base of the button is struck up and slotted to receive the T-shaped shank or post. The base can be turned over against the shank, and thus facilitate the attachment of the button.

Claim.—As a new article of manufacture, the improved sleeve or bosom button herein described, consisting of the shell F, struck-up slotted plate E, T-shaped post C, and button A, all constructed and combined in the manner and for the purpose specified.

138,108.—*Horse-Power.*—ADDISON G. WATERHOUSE, San Francisco, Cal., assignor of six-tenths of his right to J. S. NICHOLS and MOSES NICHOLS, same place. Application filed January 2, 1873.

The internal gear-wheel is eccentrically hung within the exterior wheel, engaging intermittingly with the latter, and transmitting power to the lower gearing, which connects with the pitman.

Claim.—The combination of the wheels B and C and the crank *k* with the arm or arms A, to be propelled in the manner and for the purposes substantially as hereinbefore set forth.

138,109.—*Wood-Finishing Compound or Oil.*—FREDERICK WEBSTER, Brooklyn, N. Y. Application filed March 29, 1873.

Linseed-oil, raw; linseed-oil, boiled; spirits of turpentine; strong paint-drier; wax.

Claim.—An improved finishing-oil, prepared of the ingredients in the proportion and manner substantially as herein set forth.

138,110.—*Washing-Machine.*—NELSON O. WILCOX, Omaha, Neb. Application filed March 22, 1873.

A washing-machine fitted, by an adjustable sliding base, with guides; single lower roll within the guides; an upper corrugated roll with springs fitted to and within slots in the uprights or end, onto which the journals are fitted, and upright motion allowed or given it by a separation in the center or near the center of the uprights, which are fitted to the outer frame.

Claim.—A tub washing-machine, consisting of an extension base B E, bed-roller H, corrugated roller J, stands C D, spring-holders L L, and springs N, when the same are arranged to operate as shown and described.

138,111.—*Dumping-Wagon.*—JOHN H. ADRIAANS, Washington, D. C. Application filed March 3, 1873.

A low truck adapted to be dumped by a lifting-jack.

Claim.—The herein before described dumping-truck A, inclosed at all points except its rear side, provided with the caster-rollers C, the ledge D, the nut F, and the screw G, and with or without the doors E, the whole adapted to receive earth from the shovels of workmen within a trench, substantially as and for the purpose specified.

138,112.—*Door-Latch Handle.*—JULIUS AMBRUN and ERNST OLTERMANN, Leavenworth, Kans. Application filed March 15, 1873.

Claim.—The combination, with the sliding bolt A, of the lever or handle B *b*, of such construction as to act upon the door-jamb and pry the door open when the bolt is thrown in or withdrawn from the jamb, substantially as specified.

138,113.—*Try-Square.*—WILBUR F. ARNOLD, Winthrop, Conn. Application filed October 26, 1872.

The blade of the square is secured to the stock or handle by means of a pin having an eccentric or cam-like groove, so as by its rotation to bind the blade against the bottom of the receiving-slot, and at the same time secure the pin itself from transverse displacement.

Claim.—In combination with the handle and blade of a try-square, the pin C, constructed with a cam, *a*, substantially in the manner described, to secure the blade in the handle without the necessary intervention of other pins or their equivalent.

138,114.—*Rolling-Mill.*—JOHN E. ATWOOD, Mansfield, Conn. Application filed December 24, 1873.

The rolls of each succeeding pair have their axes in planes at right angles to those of a preceding pair, the axes of all the rolls being at angles of forty-five degrees from a vertical plane. The rolls are sustained in this position by a V-shaped bed-plate, to the opposite inner faces of which the housings are secured, their tops being connected by an angle-iron tie-rod.

Claim.—1. The V-shaped bed-plate E, in combination with the reversely-oblique pairs of rolls A A' and B B' and their housings C and D, essentially as described.

2. The combination, with the reversely-oblique housings C and D, of the angle-iron tie-bar S secured to the housings by its opposite flanges or ribs, substantially as specified.

3. The combination, with the reversely-inclined or oblique roll-shafts *d d* and their rolls A B, of the upper loose bearings R R, the wheels L M, N O, and the horizontal and parallel side shafts K K, the whole being arranged in relation with each other, essentially as shown and described.

138,115.—*Subterranean Telegraph-Line.*—ELIJAH HARRISON AUSTIN, New York, N. Y. Application filed February 26, 1873.

At suitable intervals along lines of underground-telegraph conductors boxes are provided, in which the several wires are separated and supported in numbered notches of an insulated bridge, in order to facilitate the detection and repair of any faults in any of the lines.

Claim.—The arrangement of boxes A containing insulated bridges D between the sections C C of a conductor for telegraph-wires, substantially as and for the purpose herein shown and described.

138,116.—*Railway Snow-Plow.*—ORVILLE D. BAIRD, Newark, assignor to SAMUEL SOUTHWORTH and ELISAPH DORCHESTER, Geneva, N. Y. Application filed February 20, 1873.

The cut-off prevents the snow from escaping as the car is backed from a snow-drift; hinged sides and bottom are operated by hand-levers to allow the snow to be dumped.

Claim.—The construction and combination of the shovel B and slide-front G of the movable sides E E and trap-bottoms F F, as used and applied to the purposes hereinbefore mentioned.

138,117.—*Shoe-Fastening.*—ISAAC BARNETT, Newark, N. J. Application filed February 27, 1873.

An open link is secured to the end of a strap, and is adjustable in pockets formed in the quarter of a shoe. The strap is shortened or lengthened by means of a slide thereon.

Claim.—The combination of the open-end link 3, the slide 4, and the pockets *a*, all as and for the purpose specified and shown.

138,118.—*Fire-Proof Ceiling and Floor.*—JOHN W. BASSETT, New York, N. Y. Application filed March 14, 1873.

The plaster or cement slabs are formed in molds with the braces or straps B in them, the slabs and straps being perforated for attachment by screws or nails to the studding or joists, the holes being afterward filled up by plaster or cement.

Claim.—The plaster or cement slab or section A, made with an inner brace or strap, and with perforations extending through said strap and through the outer parts of the slab, substantially as and for the purpose herein shown and described.

138,119.—*Shaft-Hanger.*—WILLIAM BELLIS, Indianapolis, Ind. Application filed April 2, 1873.

A bracket, stand, or hanger, with socket for the reception of a screw-threaded shank, ending in loop that receives, in turn, the similarly screw-threaded shank of a journal-box constituting the bearing proper. Both shanks are provided with nuts to hold them in any specific position, while permitting them to turn freely in their sockets, in conformity with any angular deflection of the shaft.

Claim.—The described adjustable or yielding shaft-bearing, comprising the following essential parts—to wit: Cylindrical socket C holding screw-threaded shank E of loop D, which, in turn, holds screw-threaded shank I of bearing G H, said shanks having suitable jam and principal nuts, or their equivalents, as and for the purpose set forth.

138,120.—*Machine for Affixing Stamps to Letters.*—WINFIELD BENSEMAN and ELEZER SLOCUM, Washington, D. C. Application filed April 2, 1873.

The stamps are pressed through the open bottom of a box by a spring-follower upon the letter supported upon a yielding plate, which has a guide-apron, which presses the letter into contact with a moistening-roll as it is entered.

Claim.—1. The combination of a fixed box, A, a follower, B, and plate C, forming the bottom of the box, and having an inclined apron, C', operating substantially as and for the purpose set forth.

2. The combination of a fixed box, A, a follower, B, plate C, forming the bottom of the box, and having an inclined apron, C', and moistening-roller E, relatively arranged and operating substantially as specified.

138,121.—*Band Sawing-Machine.*—OLPHA BONNEY, Jr., San Francisco, Cal. Application filed June 1, 1872.

The frame which carries the shaft of the upper pulley is hung at one end upon trunnions, the other being carried upon and adjusted vertically by a screw and two jam-nuts.

Claim.—The pulley-shaft G supported at a point between its middle and the pulley C in a suspended box, *i*, in combination with the screw *l* and nuts *m* and *n*, substantially in the manner and for the purpose set forth.

138,122.—*Grater.*—GEORGE BOOTH, Philadelphia, Pa. Application filed March 24, 1873.

The top and two sides of the frame are made of one piece of wood and the bottom of another piece; the metallic grater-plate is then applied and secured by suitable strips.

Claim.—The improved grater herein described, having a frame with the top and two sides cut out from a single piece of wood, a bottom piece, and a grater-plate, all combined and arranged as set forth.

138,123.—*Vegetable-Grater.*—GEORGE BOOTH, Philadelphia, Pa. Application filed March 24, 1873.

The grater-plate is secured between a metallic frame and a metallic pad, the frame being provided with perforated lugs for the proper fastening of the pad thereto.

Claim.—The grater herein described, composed of a main frame-work, A A' A'' A''', a pad, B B' B'' B''', a grater-plate, C, eyes *c c'*, and keys *b b'*, the whole arranged and combined substantially as set forth.

138,124.—*Folding Chair.*—ASAHEL C. BOYD, Worcester, Mass., assignor to E. W. VAILL, same place. Application filed April 14, 1873.

The front legs and arms are formed of one piece, reversely curved, and the front legs are connected to the back legs by links, which encircle at their front ends a front round. The back extends below the seat and is pivoted to the back legs.

Claim.—1. The reversely-curved pieces A, forming the front legs and arms C D, respectively, in combination with the back E, back legs B, and folding seat F, substantially as described.

2. The side pieces A, provided with a round, *b*, that subserves the double purpose of a connecting-pivot for one end of the links *a* and a rest for the upper ends of the back legs, in combination with the links *a*, seat F, back legs B, and back E, substantially as described.

138,125.—*Corn-Sheller.*—FRANKLIN E. BROWN and JOHN R. SHANGLE, Hightstown, N. J. Application filed October 5, 1872.

An arrangement of spiral and semi-elliptic equalizing springs regulates the position and pressure of the roller-apron, between which and the studded cylinder the corn is shelled.

Claim.—In a corn-sheller, the semi-elliptic equalizing-spring *k*, secured to the plate G, in combination with the rods F, nuts H, spiral springs *n*, pivoted plates B' provided with the rollers C, and the shelling-cylinder B, substantially as specified.

138,126.—*Car-Brake.*—JOSHUA N. BRUSH, Olmstead county, Minn. Application filed May 18, 1871.

The brake is held at any required tension by means of the lever-wheel, the same being provided with lateral teeth, which engage with a rack which is secured to the truck-frame.

Claim.—The car-brake herein described, consisting of the brake-shoe C, chain D, lever-wheel E with sector of teeth G', lateral teeth H, rack I, dogs J M, and springs K' P', all constructed and arranged to operate as specified.

138,127.—*Self-Closing Faucet.*—ALEXANDER BUCKMAN and EDWARD BUCKMAN, Brooklyn, N. Y. Application filed February 5, 1873.

A loose valve, held to its seat by the current of liquid, may be opened by a movable rod, which latter, whenever it is desired to permanently close the valve, is rigidly secured by a nut.

Claim.—The combination, with the loose valve B in the body of the faucet, of the rod *c* and a screw-threaded cap or nut fitted thereto, and the fixed stop *e*, all arranged essentially as and for the purpose specified.

138,128.—*Washing-Machine.*—JAMES C. BURGNER, Poplar Creek, Miss. Application filed February 27, 1873.

A washing-machine with a revolving rubber constructed with rolls, with its shaft extending outside of the frame and held by a cross-bar, from which is appended a hook with double prongs, the lower ends of which are connected by a cross-bar with the bed on which the revolving rubber or cylinder revolves, and both held in position and adjustment by springs attached to hooks projecting from the double-pronged hook connecting the two. The bed of rolls is connected with ends having projections which are adjusted or fitted to roller friction-wheels attached to the end of the box, to give free and easy upright motion to the bed.

Claim.—1. The box D, in combination with the roller-wheel G, hook N, springs M' M', and hook N', as and for the purpose set forth.

2. The roller-wheel G, in combination with the spring M and M', and the roller-box D, hooks N N', and bar L, as and for the purpose set forth.

3. The frame B provided with guide-rollers *b b*, and used in combination with the roller-box D and hooks N N', as and for the purpose set forth.

138,129.—*Scrubbing-Machine.*—SIMEON H. BUSH, Bolstfort, Washington Ter. Application filed October 23, 1872.

The device is attached to a frame having extended sides for connecting to it the scrubber, which is a brush attached to a revolving plate with a center shaft, (upright,) around which a belt passes from the driving-pulley to give it motion. The brush is arranged to be surrounded by a circular hoop, suspended by hooks connected to or with the machine, which may be substituted, to which may be attached a mop and used in its connection.

Claim.—In a machine for washing floors, &c., the centrally-bisected wheel B in combination with belt E, shaft D, brush G, hoop H, tongue I, rod K, mop N, and mop-holder M, the whole arranged and operating in the manner and for the purpose described.

138,130.—*Embossing-Press.*—GEORGE CLISBEE, Marlborough, Mass. Application filed March 24, 1873.

The lever loosely pivoted at or near its center, receives operative movement from friction-rolls attached to a disk, which, intermittingly in their revolution, strike into a recess on the under side of the rear arm of the lever as this is raised by the treadle.

Claim.—1. The lever having the eccentric roll-track *l* and the disk *p*, rolls *m n*, shaft *d* and roll *r* and track *w*, arranged and operating substantially as described.

2. In combination with the rolls *m n* and loose disk *p*, the gears *s t u*, substantially as shown and described.

3. In combination with the lever *g*, disk *p*, and rolls *m n*, the hook a^3, link *z*, and foot-lever e^3, arranged and operating substantially as shown and described.

138,131.—*Plow.*—JAMES M. COBB, Jackson, Tenn. Application filed January 27, 1873.

A cast-metal plate, having ears to receive the upper end of the plow-standard, is bolted to the under side of the beam. The standard is inserted by a pivot-joint and further secured by a break-pin in the brace.

Claim.—The bearer-plate C, constructed as shown, and provided with ears *a a*, and the standard or foot-piece D hinged between said ears and slotted, as described, in combination with the stay-rod E with break-pin *d* and the blade G, all arranged with the beam A, as herein set forth.

138,132.—*Combined Rake and Tedder.*—ROBERT J. COLVIN, Lancaster, Pa. Application filed October 9, 1872.

A combined rake and tedder has flanges at regular intervals on the axle, which serve as guides for the tedder-arms, which arms are so made as to be removed simultaneously when the crank-shaft is released from its bearings, when the machine is converted into a rake.

Claim.—1. The fork-handle, consisting of the parts D *d*, having an open end to facilitate its detachment from the guide-axle when the tedder-shaft is removed, substantially as and for the purpose described.

2. The crank-shaft C, attached as described, in combination with the fork-handles D *d*, spring-bearing *u w y*, and axle A, with its shouldered guide-flanges *a a*, and pinions X V, all arranged as and for the purpose described.

3. In combination with the above second claim, and the frame having bearings *b* and R, a detachable rake, constructed and operated as and for the purpose described.

138,133.—*Leather-Boarding Machine.*—OWEN COOGAN, Pittsfield, Mass. Application filed March 10, 1873.

The table, supported upon arms pivoted to the frame, is susceptible of both vertical and lateral movement, so that its inclination may be varied and properly adjusted to different thicknesses of leather.

Claim.—1. The adjustable table or platform D, arranged between and in combination with the boarding-cylinders B and C, substantially as herein shown and described.

2. The supporting-arms E of the table D, when jointed, to permit the angle of the table with said arms to be regulated in accordance with the thickness of leather, as specified.

3. The adjustment-stops A, applied to the movable table D, or to its arms E, as and for the purpose set forth.

4. The combination of the table D of the boarding-machine with the ears *b*, bolts or fasteners *c*, arms E, stop *h*, and treadle or lever F, all arranged as specified.

138,134.—*Shuttle for Sewing-Machines.*—WILLIAM COONEY, Bridgeport, Conn., assignor to HOCKENSMITH & COONEY, same place. Application filed January 17, 1873.

The head of the screw bears against the lever and determines the position of the latter with reference to the wall of the shuttle according to the size of the thread being used, and the lever moves only from the regulated position toward the bobbin and under the action of the spring. The socket or bearing for the bobbin-journal has a spiral groove, which receives a screw, and, by turning the socket, it may be moved longitudinally to adapt it to bobbins of different lengths.

Claim.—1. In a sewing-machine shuttle, the lever *a*, provided with suitable eyes *f* for threading, combined with a screw, *b*, and nut *c*, and a spring between the said nut and lever in the head of the shuttle, the screw rigidly defining the distance or nearest approach of the lever to the shuttle-surface, substantially as set forth.

2. In a sewing-machine shuttle, the socket C, constructed with a spiral groove, *n*, combined with a set-screw, D, in the heel of the shuttle, substantially as set forth.

138,135.—*Fire-Place Back.*—GEORGE W. CUMMINGS, Franklin, Pa. Application filed April 13, 1872.

Claim.—1. The inclined fire-back E formed of the bars *b* and *c*, the front surface of the former which projects beyond that of the latter, substantially as shown and described.

2. The concave plate C provided with the rings *e* in combination with back E having the bars *a b*, arranged substantially as shown and described.

138,136.—*Device for Holding Cutter-Bars in Grinding.*—WILLIAM H. DANIELS, Bryan, Ohio. Application filed February 28, 1873.

A vertically-adjustable portion of the top rail allows cutter-bars of different thicknesses to be held. The front legs of the device are longer than the rear ones and tilt the top rail. Cam-levers, arranged flatwise on the top rail, secure the cutter-bar in place.

Claim.—1. The combination of the recessed or grooved top rail A *a* and vertically-adjustable supplemental rail B, substantially as and for the purpose specified.

2. The buttons C C', having cam-surfaces *c* arranged flatwise upon the recessed or grooved top rail A *a*, as shown and described, and for the purpose set forth.

3. A harvester cutter-bar holder of the character described, the front legs A^1 of which are longer than the rear legs A^2, substantially as and for the purpose specified.

138,137.—*Saw-Sharpening Machine.*—THOMAS L. DAVIDSON and HENRY WINNINGHAM, Charleston, S. C. Application filed March 1, 1873.

The yoke, by means of which the machine is supported, slides laterally upon the shaft.

Claim.—1. The sliding yoke D, provided at its rear end or side with the projecting arm *c* and the adjustable weight *d*, having a horizontal reciprocating rotatory motion on the shaft B, as described, and for the purpose mentioned.

2. The combination and arrangement of the horizontal sliding yoke D, having the projecting arm *c* and adjustable weight *d*, the yoke G having the arm F, journal-boxes *g g*, and handle *f*, all constructed and arranged as shown and described.

138,138.—*Process for Tanning.*—JAMES DAVIS and JOHN ARMSTRONG, Pittston, Pa. Application filed April 4, 1873.

The application to hides or skins at the time named of a solution composed of salt, alum, and sulphuric acid.

Claim.—The described process of tanning, consisting in the application of the compound described to the hides and skins after liming and bating, and before the introduction of tanning-extracts, as described, and for the purposes set forth.

138,139.—*Clutch for Machinery.*—WILLIAM B. DUCKWORTH, Hamden, assignor to JOHN MCLAGON and HENRY SMITH, New Haven, Conn. Application filed April 3, 1873.

Within two loose pulleys is a double conical clutch inclosed, which is connected with the slide within the hollow shaft. The slide and the platen, being connected by the lever, throw the clutch from one into the other pulley at the terminal movement of the platen.

Claim.—The combination of the platen B of an iron-planer, the driving-shaft C and loose pulleys D E on the said shaft, the clutch F constructed with a double conical face, and the pulleys constructed with a corresponding internal face, and the lever M N, when the said lever is made elastic and so as to operate substantially as described.

138,140.—*Wash-Board.*—GEORGE ELSEY, Sterling, Ill. Application filed March 29, 1873.

A wash-board constructed with sides and inclined cross-bars arranged parallel with each other, secured to the sides by tenons, with their upper edges projecting slightly for a rubbing surface.

Claim.—The wash-board, consisting of the side bars A, end strip B, and parallel inclined strip C, extending transversely between the side bars A and firmly jointed thereto, substantially as specified.

138,141.—*Car-Brake.*—ENOCH FARNSWORTH, Tipton, Pa. Application filed August 31, 1872.

To the middle portion of the car-body is suspended a swinging frame, in which is secured a pair of wheels mounted upon an axle. To this axle is fastened a rope or chain, which connect with the brake-levers. The swinging frame is connected by a rod and lever to the buffer, which is secured to a lever. When the power is applied the buffer is drawn out and, through the connecting rod and lever, raises the wheels from the track. As the power is reversed the buffers recede, allowing the wheels to come in contact with the rails and revolve, winding the rope about the axle, and thereby locking the brakes. An extra connection is made between the swinging frame and chain-shaft, by which the brake-wheels can be held clear of the rails, when the brake is not desired to act automatically.

Claim.—The combination of the car-body A, frame 2, wheels 3, axle 4, guitable ropes or chains, and rods 5 and 6, and lever 7, with its friction-roller and rod or chain 9, for applying the brakes, substantially in the manner set forth.

138,142.—*Convertible Freight-Car.*—THOMAS FOGO, St. Mary's, Canada. Application filed May 25, 1872.

The car may be readily converted from an ordinary freight or box car to a car for transporting grain in bulk, provided with a spout or chute for discharging the grain.

Claim.—1. In combination with a box or freight car the hinged section F of the car-floor, the chute C, and the vertical slide E, when the same are arranged substantially as and for the purposes described.

2. The slotted plates J, bars I, and hooks L and *m*, in combination with the flaps E E, for the purposes described.

3. The hinged handle H of the vertical slide, substantially as and for the purpose described.

138,143.—*Soda-Water and Syrup Cock.*—WILLIAM GEM, New York, N. Y. Application filed January 30, 1873.

By the raising of the valve the opening in its elbow is carried over the discharge-orifice of the cock so that the soda, passing through the hollow stem, carries with it a portion of the syrup in the large chamber.

Claim.—1. The elastic washer W furnished with an orifice, S, in combination with the valve G and the passage *p*, substantially as and for the purpose set forth.

2. The combination of the compression-valve G and slide-valves K and L, all operated by the same spindle, essentially as and for the purpose specified.

3. The elbow *f*, arranged over the outlet-orifice *e* a short distance above it, substantially as and for the purpose herein described.

138,144.—*Automatic Cradle.*—ISAAC S. GOLDMAN, Winterset, Iowa. Application filed March 1, 1873.

A cradle suspended from a shaft by a cord on pulleys, and the shaft connected with a clock-movement to give it motion. The clock-movement is eccentrically attached to the frame with a device by which it can be held out of a perpendicular line on its upper edge, to control the position of the cradle.

Claim.—1. An automatic cradle having the receptacle B suspended to the main shaft C by the cords *b b*, as shown and described.

2. In an automatic cradle, a rack and pinion attachment for adjusting the apparatus to an uneven surface, substantially as shown and described.

138,145.—*Gun-Lock.*—CHARLES GORDON, Goswell Road, England. Application filed October 27, 1871.

Claim.—In a gun-lock, the combination, with the plate *e* provided with the slot *g*, of the hammer *c*, trigger *f*, sear *d*, and combined main and sear spring, the several parts being constructed and arranged for operation substantially as described.

138,146.—*Breech-Loading Ordnance.*—CHARLES GORDON, Goswell Road, England. Application filed April 18, 1873.

This invention has for its object the provision of a breech-block which may be readily and securely locked in position in the gun, the means for which is fully set forth in the claim.

Claim.—The combination of the rear block B, block C, head-piece D, eccentric locking-blocks G G, spindle E, and cams F, all united together and operating in connection with the breech of a gun, substantially as described.

138,147.—*Sizing Compound.*—THOMAS GORRELL, Warren, assignor of one-half his right to GEORGE J. HAMPSON, Providence, R. I. Application filed April 12, 1873.

Claim.—1. A compound consisting of tallow, salt, soap, molasses, bees-wax, isinglass, and flour, when mixed in the manner and substantially in the proportions herein set forth.

2. Combining the composition herein described with starch for the purpose of adapting it for application to yarns, as set forth.

138,148.—*Lock for Drawers, &c.*—EMANUEL G. GOBY, Cincinnati, Ohio, assignor to himself and H. T. NIEMANN, same place. Application filed November 19, 1872.

The rear face of the lock-case is provided with projecting flanges, which are driven into the wood, and serve to hold the lock securely in the cavity formed for its reception without the aid of screws or nails.

Claim.—A lock for drawers and other uses whose frame A is made with side extensions *a* at the rear face to enable the lock to be firmly secured in the routed cavity B *b* in the drawer, substantially as and for the purpose specified.

138,149.—*Spring-Plate Washer.*—FAYETTE R. GRIDLEY, St. Paul, Minn., assignor of one-half his right to THOMAS JORDAN, Indianapolis, Ind. Application filed January 15, 1872.

A connected series of spring-washers, formed by indenting or recessing a straight plate at the points where the bolts are to pass on the surface opposite to that against which the nuts are to be applied.

Claim.—1. In a fish-joint or other similarly-constructed joint, the combination, with the splice-pieces and bolts and nuts, of the spring-plate washer C, substantially as and for the purposes set forth.

2. A fish-joint or other similarly-constructed joint, consisting of solid plate B and recessed spring-plate C bolted to the rails or beams D, substantially as specified.

3. As a new article of manufacture, a spring-plate washer, C, constructed substantially as herein set forth.

138,150.—*Dentist's Tool.*—CHARLES P. GROUT, New York, N. Y. Application filed January 30, 1873.

The tool is held in its socket by means of a spring, which works in a rounded cavity in the shank. A simple pull releases the tool, which, when fastened, is prevented from rotating. This fastening is intended for drills, rotated by a lathe for dental work.

Claim.—The tubular slotted handle A, combined with the spring D, which is rigidly fastened to it, and which is provided with the projection *b* for locking the notched tool-shank B, and for allowing the release of said shank by a simple pull, substantially as specified.

138,151.—*Door-Bell.*—JAMES HARRISON, East Hampton, Conn. Application filed December 4, 1872.

The hammer, pivoted beneath the bell, is arranged to strike a double blow on the outside of the bell by a single pull through the action of the spring on an eccentric hub of the hammer.

Claim.—1. The combination of the spring *d* with the shank of the hammer D, the pull-wire E, and the bell A, substantially in the manner and for the purposes set forth.

2. The eccentric *b*, formed on the shank of the hammer D, and provided with a groove, *f*, in combination with the spring *d*, pull-wire E, and bell A, all constructed and operating substantially in the manner shown and described.

138,152.—*Combined Rule, Square, and Bevel.*—CASSIUS M. HEFFRON, Rochester, N. Y. Application filed February 21, 1873.

A double-jointed rule is provided with a spring catch and clamp in such manner that it may be set as a square or as a bevel.

Claim.—1. In combination with the parts A B provided with the notches *a a'* and slots *b b*, made in the angular or bevel form described, the combined clamping and locking device, consisting of the nut D, the block E with offsets *i i*, and the spring-arms *d d*, the latter provided with the bevel-catches *g g*, the whole arranged to operate in the manner and for the purpose specified.

2. In combination with the parts B C, the spring *m* formed from the part C by slitting, as described, and armed with a stud, *n*, which strikes into sockets formed for its reception in part B, substantially as specified.

138,153.—*Thread-Cutter for Sewing-Machines.*—CHARLES J. HENRY and CORNELL J. WOOD, Tunkhannock, Pa. Application filed February 18, 1873.

The button is adapted to a recess in the plate, and arranged so that a portion of it projects above and crosses the plane of the top of the plate. This arrangement forms a notch, into which the thread is drawn and broken or cut.

Claim.—The combination of the button and plate, so arranged that one side of the button shall extend above the surface of the plate, for the purpose of forming a cutting device, substantially as shown and described.

138,154.—*Elevator.*—ARIEL C. HERRON, Boston, Mass., assignor to himself and DAVID WHITTEMORE, same place. Application filed April 2, 1873.

The hoisting-rope is connected to car by means of link, formed as a wedge, and having bolt-pin extending through cross-beam at top of car. The bolt-pin has at bottom flange a washer, and between this and the beam is a spring, which is compressed by weight of the car, but expands and draws down the bolt in case of breakage of hoisting-rope. On top of beam are pivoted levers, the inner ends of which extend nearly to the center of the beam, the wedge extending between and separating them; the outer ends extend by the uprights, and have eccentrics attached so that if the rope breaks the spring draws down the bolt, the wedge forces the inner ends of the levers outward, and the eccentrics on the outer ends are thereby forced against the uprights, stopping the car.

Claim.—The combination of the wedge A, nut *i*, spring *l*, levers *m m n n*, and eccentrics *p*, arranged and operating substantially as shown and described.

138,155.—*Dyeing with Aniline Black.*—JAMES HIGGIN, Manchester, England. Application filed February 12, 1873.

Claim.—The use of the disulphocyanide of copper as an assistant oxidiser in printing color for producing aniline black.

138,156.—*Canal.*—HENRY HILL, Cabin Creek, W. Va. Application filed June 7, 1872.

This device is to be employed where a sufficient natural head or supply of water can be obtained to move boats in a descending channel by the current alone, and utilize the overflow or waste water from said channel to overcome the rises in a parallel return-channel, a portion of said waste water being lifted to successively higher levels or steps by means of buckets, operated by mechanism actuated by the preponderance of the waste water discharged. The boats are transferred to the higher levels on inclined planes formed of series of rollers, which are revolved by similar mechanism, the motor being the waste water.

Claim.—1. Utilizing the waste water which flows from the higher to the lower sections in one channel, in the manner substantially as described, for raising water from the lower to the upper sections of the opposite channel, or for lowering and elevating the boats from one level or section to another, substantially as described.

2. The inclined ways P provided with the rollers Q, in combination with the mechanism for transmitting motion to the rollers when operated by the falling water in one of the channels, substantially as and for the purpose set forth.

138,157.—*Breech-Loading Fire-Arm.*—GARDNER L. HOLT and JOSEPH C. MARSHALL, Springfield, Mass., assignors to EDWD. H. BUCKLAND and ALMANGOR A. BUCKLAND, same place. Application filed February 28, 1873.

Claim.—1. The hammer L and trigger E, made in one and the same piece, substantially as described.

2. The combination of the hammer L provided with the notch I, the hammer-pivot J, and the spring G, whereby the hammer is held in a cocked position and is also forced forward to explode the cartridge, substantially as set forth.

138,158.—*Corn-Planter.*—GEORGE O. HOUCK, Springfield, Ohio. Application filed February 21, 1873.

A long narrow frame carries two wheels and a seed-box. The forward wheel has its circumference presenting an acute angle, that forms a furrow for the seed. The rear wheel is deeply grooved, the two flanges forming the groove passing upon the outside of the furrow, thus covering the grain, which is dropped at regular intervals, a hill at each revolution of the wheel. The grooved wheel has a print-marker, which designates the position of the hill, for the purpose of check-row planting.

Claim.—The combination of the furrowing-wheel B, seed-dropper D D', coupling-rod E, crank F^2, and concaved covering-wheel F having the transverse rib F^1, all constructed and arranged substantially as and for the purpose set forth.

138,159.—*Water-Proof Plastic Cement for Roofing.*—GARDNER HOWLAND, Brunswick, N. Y. Application filed December 16, 1872.

The composition is composed of paper-pulp, two parts; linseed-oil, one part; and white lead or mineral paint, a sufficient quantity. It forms an elastic and tenacious water-proof material for covering roofs and analogous purposes.

Claim.—The combination of paper-pulp, linseed-oil, and white lead or mineral paint, in about the proportions herein specified, to form a water-proof, adhesive, and flexible coating or body.

138,160.—*Gas-Generator.*—DAVID H. IRLAND, Hudson, Mich. Application filed March 21, 1873.

Claim.—1. The combination of the furnace A with exterior shell E and hot-air pipes *c c* and a revolving retort, D, substantially as and for the purposes herein set forth.

2. The arrangement of the smoke-pipes *b b*, as shown and described, along the sides of the furnace A, for the purposes herein set forth.

3. The combined condenser and cooler G, constructed as described, with the condensing-chamber G^1, having faucet *i* and the cooling-chamber G^2 with funnel *k* and pipe *m*, all substantially as and for the purposes herein set forth.

4. The purifier I, provided with grates J J placed in an inclined position, and three of the spaces thus formed filled respectively with whiting, oyster-shells, and tan-bark, substantially as and for the purposes herein set forth.

5. The perforated funnel L and perforated cylinders M M, arranged within the vessel K, substantially as and for the purposes herein set forth.

138,161.—*Pipe-Tongs.*—ALBERT H. JARECKI, Erie, Pa. Application filed March 21, 1873.

The adjustable steel bar is sharpened at both ends and reversible.

Claim.—1. The steel bar G, pointed and sharpened on both ends, serrated on one face, and operated by the worm-wheel D, as and for the purposes herein set forth.

2. The combination of the handles A A', hook B, enlarged, forked, and mortised part C, worm-wheel D, and reversible and serrated steel bar G, all constructed and arranged substantially as and for the purposes herein set forth.

138,162.—*Method of Adjusting Signaling-Mirrors.*—MARTIN M. KENNEY, Travis, Tex. Application filed December 2, 1872.

A mirror held adjustably in any position, has a small opening through its center, the shadow from which is set upon an adjustable arm placed a short distance in front of the mirror. By sighting through the opening in the mirror so as to bring the shadow-point in line with the distant station, the accurate adjustment of the mirror for reflecting to the station is secured.

Claim.—The combination of an adjustable perforated mirror and an adjustable shadowing-post, arranged and applied as and for the purpose described.

138,163.—*Sewing-Machine.*—MICHAEL H. KERNAUL, Berlin, Prussia. Application filed March 17, 1873.

The thread from a bobbin, such as is used in a Wheeler and Wilson machine, passes through the end of a lever or arm, which always remains in about a vertical position; the bobbin is fitted

to turn on the cup-shaped end or hub of this arm, and the degree of friction between the two and, consequently, the tension of the thread is regulated by means of the screw-nut and spring.

Claim.—1. The combination with the spool A and lever B, having a cup-shaped end *b*, of the nut *f*, screw *j*, and spring *k*, all arranged to operate essentially as described.

2. In combination with the spool A, lever B, nut *f*, screw *j*, and spring *k*, the socket C, arranged to hold the spool and lever firmly to each other while the spool is being filled, and constructed to operate essentially as described.

138,164.—*Oyster-Dredge.*—ISAAC A. KETCHAM, Breslau, N. Y. Application filed February 19, 1873.

The teeth are separately detachable, bent at a right angle, and locked fast by a screw-nut to each tooth. These nuts also draw the teeth into grooves in the rake-head, which serve to prevent lateral displacement of the teeth.

Claim.—1. The tooth C of an oyster-rake provided with an end-bent shank, *c*, detachably fastened to the rake-bar, as and for the purpose described.

2. The rake-head B having the grooved seats *b'* for reception of the teeth, as and for the purpose set forth.

3. The plates C' C', arranged over and in front of the rake, and attached to frame A *a'*, as and for the purpose specified.

4. The means described for spacing the distance between the bar *a* and lever-gage D, and consequently the depth to which the the teeth may sink into the soil, consisting of the loop *d'*, screw E, and tubular-shanked stop-nut F *f*, arranged as described.

5. The bar G, hung loosely on frame A from one end and provided with a bifurcation at the other to embrace rod *a*, as and for the purpose set forth.

138,165.—*Boat-Detaching Apparatus.*—JAMES M. KILNER, Chester Castle, Chester, Great Britain. Application filed April 18, 1873.

Two shackles are jointed to the bow and stern of a boat, one above the other. The upper one allows the block-chain to pass freely through it, but the lower one has a narrow slot near its outer end with V-shaped inner surfaces to gripe the chain better. The upper shackle, being raised, allows the chain to pass from the narrow slot in the lower one to a larger opening connected with it, by which the chain is automatically released.

Claim.—1. The shackles *c d*, jointed or pivoted to a suitable support attached to the boat, and formed and arranged to operate on a chain and in combination with each other, substantially as set forth.

2. The shackle *c* formed with the V-shaped edges c^3 and with the cross-piece c^4, for the purpose specified, in combination with a pivoted shackle, *d*, substantially as described.

138,166.—*Grain-Drill.*—JACOB KING, Indianapolis, Ind., assignor of one-half his right to BERNER, ENGLISH & OVER, same place. Application filed February 15, 1873.

Two iron side boxes vertically pivoted to a central one, the whole formed of upper and lower halves bolted together; in each is a pinion on a horizontal axis; the device to be placed at the apex of a triangular frame. Motion given to the central pinion by a rod passed into it from gearing on a front bearing-wheel. Other rods passed into the side pinions give rotation to the seed-cup boxes on the side of the frame and permit angular adjustment.

Claim.—The case or boxing G H H and wheels D D E F, constructed and arranged substantially as and for the purpose set forth.

138,167.—*Wash-Boiler.*—RUDOLPH LANGENBACH, New York, N. Y. Application filed April 4, 1873.

A wash-boiler constructed with an inner cylinder sufficiently reduced to admit steam and water between the outer and inner cylinder, with a bottom, and another partition or bottom which is perforated, through which a perforated water-conductor is passed, having on its upper end a cap with perforations. Attached to the top of the cover are bars, connected with an upright which revolves and to which is attached a lever to move it, by which they are given outward motion to the holding-staples to secure the top of the boiler firmly to it.

Claim.—1. The arrangement of a perforated inner wall on a wash-boiler, said inner wall being provided with a perforated tube and rose-head, which, in addition to the annular space *a*, forms the communication between the lowest compartment *d* of the boiler and the clothes compartment, substantially as set forth.

2. The swivel-head F and lock-bolts G, in combination with cover D and with the body of a wash-boiler, constructed and operating substantially as shown and described.

138,168.—*Reciprocating Churn.*—MAGNUS LITTY, Williamsville, Neb. Application filed December 7, 1872.

An upright cylindrical churn, its spindle or shaft of many arms ascending through the top, whence both ends of a cord coiled around it are extended to a pair of bars pivoted at the base, by drawing which alternately with the hands of the operator the dash-shaft is rapidly revolved in different directions, a detachable cross-beam at top affording a bearing to the shaft.

Claim.—1. The notched vibratory alternating arms I with their lower ends pivoted to the table A, the rotary churn-dasher C, cord H connecting said arms and dasher, and the churn B, combined and arranged as specified and shown.

2. The mortised and tenoned beam D, the upright E, the upright F having beveled notches, the wedge H', and the removable dasher C, substantially as and for the purpose specified.

138,169.—*Lubricator.*—FREDERICK LUNKENHEIMER, Cincinnati, Ohio, and JAMES MEEHAN, Covington, Ky. Application filed March 21, 1873.

Stand-pipe for the admission of steam into the chamber containing the lubricator, having valve which opens and closes with the action of the steam, the said valve being provided with duct, through which a small column of steam may always ascend, thereby preventing the congelation of the lubricator.

Claim.—1. The provision, in a steam-engine lubricator-reservoir, of stand-pipe C, valve D, gage H, and closing screw-plug I, in the described combination, for the purpose set forth.

2. In the described combination, the plug I, gland O, loose collar N, and elevated neck L of the reservoir.

3. The described arrangement of valve D, having the tapering stem F occupying the diaphragm E in the stand-pipe C.

4. The provision in the valve D, of the duct G, for the purpose designed.

5. In the described combination with hollow screw-plug I, valve D, and channeled stand-pipe C, the adjustable bowl *j*, for the purpose set forth.

138,170.—*Plaster Wall.*—MICHAEL F. LYONS, New York, N. Y. Application filed February 28, 1873.

Slabs or plates are formed of metallic frames made of V-shaped stripe, filled with mortar or cement, which, after the material has hardened, are secured to the studding or joists to form the inner wall. A finishing coat of plaster may be afterward applied.

Claim.—1. The V-sectioned metal frames A and the earthy filling B, combined and adapted to serve as herein set forth.

2. The within-described method of finishing rooms and buildings by means of sheets of earthy material held in metal frames and adapted to be readily applied and secured by nails or the like, with the joints filled and the surfaces covered with additional material applied as herein set forth.

138,171.—*Cap to Prevent the Bursting of Carbonic Acid and other Vessels.*—JOHN MATTHEWS, New York, N. Y. Application filed April 18, 1873.

A metallic disk is clamped in a cap which has a chamber in the upper portion, from which openings project downward. The disk is made of a metal like copper, which is strongest when cold, and a metal like iron, which is strongest when warm, so that the strength of the disk remains the same under varying temperature.

Claim.—1. The improved device herein described, for preventing the bursting of carbonic-acid generators and other vessels, provided with a disk composed of two or more metals so as to compensate for varying temperature, as and for the purpose set forth.

2. The combination of the cap C, nut D, and packing E, substantially as described.

3. The cap C provided with chamber B and downwardly-projecting orifices *i*.

4. The corrugated annular disk-seat formed of the hollow nut D and corrugated base *g*, as described.

5. The combination of the cap C, disk *a*, nut D, and packing E, all so as to operate substantially as set forth.

6. Compound disk made by uniting copper and iron or other metals similarly effected by heat so as to secure a uniform strength under varying degrees of temperature.

7. The disk *a*, made of iron and copper or equivalent metals, and coated so as to resist corrosive liquids and gases, as set forth.

138,172.—*Harvester.*—SIMON L. MCCOLLOCH, Wheeling, W. Va. Application filed March 6, 1873.

A cam-cylinder is mounted on the front end of a vibrating frame, and a coupling-arm supporting the vibrating lever, which is operated by the cylinder, is hinged about the cylinder-case.

Claim.—1. The combination, with the clutches *a* and springs *b*, of the rods *e*, collars *d*, levers D, and foot-piece G with wedge E, all substantially as and for the purposes herein set forth.

2. The cylinder J placed at the end of the main frame, and provided on its circumference with zigzag grooves, as shown, in combination with the vibrating lever R, hinged bar L, elbow-lever O, shoe M, and cutter bar P, substantially as and for the purposes herein set forth.

3. The combination of the vibrating lever R, ball *m*, and grooved elbow-lever O with the shoe M and cutter-bar P, for the purposes herein set forth.

4. The combination of the slotted elbow-lever O, cutter-bar P, shoe M, pivot *x*, and friction-rollers *y z*, for the purposes herein set forth.

5. In combination with the hinged bar L and shoe M, the curved brace-rod V provided with a T-head, and the casting W secured at an angle to the tongue *y* and provided with an oblong slot on its under side, within which the T-head moves, substantially as and for the purposes herein set forth.

6. The arrangement of the hooked lever A', wheel Z with cam *w'*, and chain *w* connecting with the bar L, for the purposes herein set forth.

138,173.—*Suction Apparatus for Paper-Machines.*—WILLIAM MCLAUGHLIN, Lee, Mass. Application filed February 12, 1873.

To prevent the motion of the web being impeded, and to prevent injury to the same by friction, rollers, upon which the web rests, are arranged within the suction-box. These rollers turn in separate packing-boxes, which contain an adjustable follower to keep the packing pressed against the roller and thus render the suction-box none the less air-tight.

Claim.—The combination of the suction-box A, packing-boxes and rollers C, packing E, followers F, and web B, substantially as and for the purpose described.

138,174.—*Artesian-Well Boring.*—WILLIAM MCPHERSON, Manchester, N. H. Application filed September 11, 1871.

Apparatus for sinking shafts for wells, consisting of derrick A frame composed of two timbers, B B, bolted together so as to allow open space between them for passage of buckets and other tools employed in discharging water, sand, &c., accumulating in

the tubes F during the process of sinking them. The tubes covered with block E, (perforated through the center to correspond with diameter of the inside of the tubes,) on which the beams B B set as a lever, having for a fulcrum the frame-work C, and by their own and added weight force the tubes length after length into the ground.

Claim.—An apparatus for sinking shafts for wells, consisting of the two beams B B, secured together as shown, having their fulcrum in the frame C, in combination with the derrick A, constructed as described, all arranged to operate substantially as set forth.

138,175.—*Grain-Elevator.*—HELEN MERRILL, Brooklyn, N. Y. Application filed September 28, 1872.

Claim.—1. The arrangement of the apparatus for the elevation of grain or other similar material by the induction of an uninterrupted current of air, substantially as described.

2. The combination, with the lift-pipe, of the adjustable cylindrical regulating-valve having an air-space between the pipe and valve-cylinder.

3. The combination of the suction-pipe *g* and blast-discharging pipe h with the receptacle *e*, when their terminuses are in opposite ends of the receptacle, as and for the purpose specified.

138,176.—*Process for Casting Bearings on Shafting.*—JAMES MILLER, New York, N. Y. Application filed February 17, 1873.

The shaft is held in a lathe and heated while being revolved. The flask is placed on the shaft and the bearing cast without removing it from the lathe.

Claim.—1. The method herein described of casting bearings on shafts while the shafts are held in lathes, as set forth.

2. The combination of the heating apparatus D with the lathe A for the purpose of heating the shaft when in such lathe, as set forth.

138,177.—*Box-Opener.*—LUCIEN MILLS, Jersey City, N. J. Application filed January 18, 1873.

The chisel end is provided with a notch, whereby the iron straps on boxes may be severed.

Claim.—The box-opener consisting of implement A, having its chisel end provided with a sharp curved notch, *a*, in the center, and its opposite end made of an angular or foot-like shape, with a curve or bend, *b*, in the angle and with claws B, substantially in the manner and for the purposes herein shown and set forth.

138,178.—*Construction of Vessels.*—WILLIAM F. MORGAN, New York, N. Y. Application filed February 21, 1873.

The "ceiling" of a vessel is composed of a boarding with square joints, and an internal boarding with rabbeted joints, which strengthen the ship and prevent moisture from injuring the grain, and also the grain from getting into the bilge. The grain-space is divided into three longitudinal sections or bins, which are divided by "shifting-planks," composed of rabbeted boards.

Claim.—1. The combination, in ceiling the holds of vessels, of a boarding, E, with square joints, and a boarding, F, with rabbeted joints, constructed and applied substantially as shown, and for the purposes described.

2. The partitions or shifting-planks I I, arranged as described, to divide the upper part of the bin or grain-space, fore and aft, into three parts, substantially as described.

138,179.—*Dumping-Scow.*—AUGUSTUS T. MORRIS, Bloomfield, N. J. Application filed March 5, 1874.

Claim.—1. The dumping-scow, made with the double inclines *c d e f*, in combination with the central and lateral discharge-openings and doors or flaps *m m o o*, substantially as and for the purposes set forth.

2. A dumping-scow, made with the central float *b* and end floats *a*, connected by the two double inclines *c d e f* and bottoms *g*, in combination with the lateral and central discharge-openings and the doors or flaps, substantially as set forth.

138,180.—*Device for Capping and Uncapping Cartridges.*—JOSEPH F. NETTLETON, Branford, Conn. Application filed April 3, 1873.

Device for placing upon cartridge-shells the cap or primer which is inserted into a cavity upon the rear end or head of the shell prior to charging the shell.

Claim.—The herein-described cartridge-primer, consisting of the cylinder A with its ledge B for the support of the shell, the lever D constructed with the notch *f*, and the follower E with its spindle *b* within the said cylinder, all substantially as set forth.

138,181.—*Corn-Harvester.*—SAMUEL PATTON, Chatsworth, Ill. Application filed April 24, 1872.

A husking and gathering frame, with gathering-heads, husking-rollers, and endless-apron elevator attached, is pivoted above the axle of the supporting-wheels, and may be adjusted at different heights, gathers one row at a time, which is received between a divided tongue.

Claim.—1. The husking-rolls M, when provided with the lips *m* of the form shown and described, having abrupt shoulders on one side and of an elliptic curve on the other, and arranged to operate as set forth.

2. In combination with the husking-rolls, as above described, the spirally-grooved head Q, when arranged to work against or in close proximity to a smooth head, as shown, so as to separate the stalks and feed them between the rolls singly and at regular distances apart, as set forth.

3. The bell-shaped gathering-heads S, provided with the tangential arms P having the outwardly-curved ends, as and for the purpose set forth.

4. The pivoted gathering-frame K mounted on the main frame A, and provided with the transverse shaft N, said shaft being passed through the journals of the frame K, and provided on its ends with pinions i gearing into teeth on the main wheels, as shown, so that the frame may be adjusted without affecting the gearing.

5. In combination with the husking-rolls and the elevating-apron T, the horizontal apron X for delivering the corn at the side of the machine, as set forth.

138,182.—*Table-Leaf Support.*—GEORGE PAYZANT, Chicago, Ill. Application filed February 26, 1873.

A hinged supporting-arm strikes against a fixed arm on the table when the leaf is raised, and the fixed arm has a laterally-inclined side to press against the hinged arm and fold it when the leaf is folded.

Claim.—A table-leaf support, consisting of the supporting-arm D and of the brace or bearing C provided with a laterally-inclined arm, C', for the purpose of folding the arm D when the leaf is folded, substantially as specified.

138,183.—*Seat.*—JOHN PEARD, New York, N. Y. Application filed March 28, 1873.

The hinged seat is connected to the hinged arm-piece by a hinged brace and link; the hinged arm-piece supports a pivoted desk; the inclination of the desk is adjusted by a secondary brace pivoted at the top of the main brace.

Claim.—1. The combination, with a hinged seat, A, and a hinged arm-piece, D, of the brace C, link *b*, stops *f* and *g*, and swivel-desk E, all constructed, arranged, and operating as and for the purpose specified.

2. The secondary brace *i*, combined with the main brace C, link *b*, arm-piece D, pivoted desk E, and seat A, substantially in the manner and for the purpose described.

138,184.—*Cupola-Furnace.*—JOHN B. PEARSE, Swatara township, Pa. Application filed January 18, 1873.

The water-cooled breast-block prevents the breast of molding-sand from melting and becoming dangerously thin, and also the gradual enlargement of the tapping-hole. A cast-iron runner daubed with "clay-wash" does not clog by adhesion of slag.

Claim.—1. The combination, with a cupola as ordinarily constructed, of a water-cooled breast-block containing the sand-breast, substantially as and for the purpose specified.

2. The combination, with a cupola as ordinarily constructed, of a cast-iron runner, sufficiently thin to be cooled by the air, substantially as set forth.

3. The combination, with a cast-iron runner, as described, of a cooling-tube cast in the bottom of the same, substantially as and for the purpose specified.

138,185.—*Lamp.*—JULIUS A. PEASE, Boston, Mass. Application filed November 27, 1872.

The reservoir is adjustably suspended above the chimney; a tube leads therefrom to the basin, from which the flame-supply is drawn. A drip-pan is secured in the bottom of the hollow pedestal, and serves to catch the overflow from the wick-tube basin.

Claim.—1. The combination of the wick-tube basin, the pedestal, and the drip-basin, substantially as and for the purpose specified.

2. The adjustable reservoir, provided with the feeding-tube, in combination with the wick-tube basin, and drip-basin within the pedestal, as and for the purpose set forth.

138,186.—*Windmill.*—WALTER PECK, Rockford, Ill., assignor to DAVID S. PENFIELD, same place. Application filed January 17, 1873.

A hollow cylinder is supported upon and revolves freely in plates or sockets; secured to the cylinder is a shank, cast in one piece with it, and having arms or lugs projecting horizontally. A grooved ring surrounds the cylinder, and has notches cut in its inner surface which fit over feathers on the cylinder, leaving it free to rise and fall and revolve with the cylinder. A weighted lever is secured to the post, and is connected with the grooved ring by means of a link which slides in one of the plates. A bearing-box, in which the shaft of the wind-wheel is mounted, is provided at its inner end with an upright arm, from which project two arms, corresponding with those on the shank, secured to the cylinder. The wheel shifts its position according to the direction of the wind. When the wind increases in violence the angle at which the face of said wheel is presented to the wind may be changed so as to maintain a nearly uniform speed of revolution.

Claim.—1. The hollow cylinder B, provided with the shank B' for the vane and the arms b^2 b^3, in which the sleeve or box E is pivoted, substantially as set forth.

2. The sleeve or box support E, provided with its vertical arm *e* having its projecting lugs, in combination with the cylinder B provided with the vertical arm b^4 and lugs b^2 b^3, these parts being united by the pivot e^1, substantially as described.

3. The arrangement of the hinge or pivot of the wind-wheel over or nearly over the vertical center of the cylinder B, substantially as described, so that the relative position of the pitman with the cylinder shall not be materially changed when the wheel is brought parallel to and in line with the vane, as and for the purpose set forth.

4. The combination of the rock-shaft, provided with crank-arms d d^2, with the cylinder B, sleeve E, loose ring C, weighted lever c^2, and their connecting devices, substantially as set forth.

5. The combination of the lever D' with the cylinder B, sleeve E, links d^1 d^1, and their connecting devices, substantially as set forth.

6. The combination of the stops *g g'* with the sleeve E, cylinder B, shank B', and operating devices, substantially as set forth.

138,187.—*Reversible Pinion for Watches.*—FERDINAND PICKERT, Concord, N. H. Application filed March 24, 1873.

An under-cut segment of the center pinion-arbor is pressed transversely by a spring so as to engage with a corresponding recess in the interior of the pinion, and thus act as a pawl for locking the pinion to its arbor in the going direction of strain, while allowing it to slip freely in the backward direction.

Claim.—1. The pinion retaining or locking catch or pawl H, provided with dovetailed or enlarged ends, inserted into a corresponding seat in the arbor A, in combination with the pinion B, having a notch or groove on its interior periphery, substantially as described, for the object specified.

2. In combination with the arbor and catch, the spring E, bearing upon the heel of the catch, as and for the purpose set forth.

138,188.—*Hot-Air Furnace.*—CHARLES L. PIERCE, Natick, Mass. Application filed December 28, 1872.

Above the combustion-chamber is another chamber communicating with it by a central opening controlled by a damper. The sides of the upper chamber project so as to receive pipes which connect at the other end with a chamber around the base of the stove. The draft may be direct through said central opening, or caused to pass down into the lower chamber, and thence to ascend through the upper chamber to the exit-pipe.

Claim.—1. The chamber E E' opening at top into combustion-chamber D and arranged about fire-pot, in combination with a series of radiating vertical flues, F, placed at intervals around the air-chamber and leading to the smoke-flue through chamber L, as and for the purpose described.

2. An annular combustion-chamber, D, having damper *d* at the top and opening into chamber E, as and for the purpose set forth.

3. The annular register K combined with the chambers E and E' and flues F, and so arranged in relation to them that it will allow any deposit from either to be transferred to the ash-pit beneath it, as set forth.

4. The tunnel G declined inwardly and obliquely downward toward the center of combustion-chamber and having the smoke-flue H extending to near the bottom thereof, in combination with damper *d*, combustion-chamber D, annular chambers E E', and flues F, as described, to enable the deposit from the tunnel to be readily emptied into the fire-pot.

138,189.—*Hot-Air Furnace.*—CHARLES L. PIERCE, Natick, Mass. Application filed December 28, 1872.

The draft passes down from the projected top of the combustion-chamber through the pipes around the furnace into a chamber under the ash-pit, and thence by a central pipe to the exit-pipe. This central pipe turns on a bottom flange so as to adapt the furnace to be set in any location.

Claim.—1. A furnace having combustion-chamber closed, projected at top and provided with pendent flues *b* leading from top down through the air-chamber into a hollow chamber below ash-pit, in combination with the central swiveled smoke-flue *d* and flue F, as and for the purpose described.

2. The arrangement of the smoke-flue F within the air-chamber, in combination with the swiveled connecting-pipe *d*, as and for the purpose set forth.

3. The connecting-pipe *d*, swiveled and arranged to turn, as and for the purpose described.

4. The chamber projecting and notched, as described, to allow the smoke-flue to be placed within the air-chamber.

5. The combination of the descending tubes with the sub-base and central draft at bottom, as and for the purpose set forth.

138,190.—*School-Chair.*—EDWIN J. PIPER, Springfield, Mass. Application filed April 9, 1873.

To the top of the pedestal are secured two metallic side pieces, each having an inside flange, upon which are fitted slats having a recess made in each end. These metallic side pieces form the side frames for the seat and back, and are held together by screws inserted in the ends of a portion of the slats.

Claim.—1. In an improved school-chair, the frame *b* provided with the inside flange *n* and the projections *f*, in combination with the slats *a* having a recess, A, in each end, whereby the slats and frame are fitted together, and the slats secured at proper distances apart, substantially as described.

2. The frame *b* provided with the wings or pieces *e*, in combination with the pedestal provided with the flange B, whereby the chair-seat is secured to said pedestal, substantially as set forth.

138,191.—*Nutmeg-Grater.*—ALBERT L. PLATT, Bloomington, Ill., assignor to JOHN D. CONNERS and THEODORE K. CONNERS, same place. Application filed April 11, 1873.

The frame of the grater is constructed of a single block of wood with openings to receive the grating-cylinder, feeding and discharging pipes. A crank connects with the rim of the grating-cylinder.

Claim.—As an article of manufacture, the nutmeg-grater shown and described, constructed of a single block of wood, A, with openings *b b' d*, grating-cylinder B, and crank C, connected to the rim of the cylinder, all as set forth.

138,192.—*Harvester-Cutter.*—CHARLES POMEROY, Matteon, Ill. Application filed December 26, 1872.

Horizontally-revolving cutters are attached to sockets which fit over and are driven by vertical square journals, and are held thereon by a plate long enough for the set.

Claim.—In combination with the spur-wheels *a a*, shafts *c c*, and endless chain *b*, the knives C C connected to the socket-disks D D and held in place by the covering-plate E, substantially as set forth.

138,193.—*Machine for Recessing Tobacco-Boxes.*—ISAIAH M. REAMES, Oxford, N. C. Application filed January 23, 1873.

A revolving cutter is arranged in a frame so as to reciprocate vertically, the box being held in contact with the cutters by means of a screw-clamp.

Claim.—The cutting devices H I, mounted in a vertically-sliding frame, E F, provided with a rod, R, and treadle Q, all arranged to operate as herein specified.

138,194.—*Belt-Fastening.*—JEAN E. RICHARD, Columbia, S. C. Application filed February 15, 1873.

The ends of the belt to be united are split, cut, or bored, and cores inserted to prevent the clamps from drawing off.

Claim.—The combination of the separable clamp-plates and the core-pieces with the split, cut, or bored belt-ends, substantially as specified.

138,195.—*Cooler for Beer.*—AUGUST F. RICK, Chicago, Ill. Application filed February 21, 1873.

A blower forces air through pipes surrounding an ice-receptacle into a chamber containing one or more inclined partitions, over which the beer flows.

Claim.—In combination, the chamber B provided with an ice-receptacle; the chamber I provided with one or more inclined floors; the pipes C C arranged substantially as described; a blower and a "steeple," all operating together, substantially as and for the purposes specified.

138,196.—*Plow-Boot.*—CHARLES H. RICKER, Dover, N. H. Application filed March 1, 1873.

The peculiar cut affords a proper bend above the instep and a swelled back for the calf without crimping.

Claim.—A boot having its vamp and leg-pieces formed substantially as shown in Figs. 5 and 10, and sewed together as described.

138,197.—*Plow.*—JACOB ROOP, Clinton, Tenn. Application filed March 12, 1873.

The mold-boards are movable in the grooved standard, and when raised the point D becomes a subsoiler.

Claim.—1. The mold-boards G G, in combination with the rods *d d* and handles H H, as and for the purpose set forth.

2. The standard I, in combination with the handles H, as and for the purpose described.

3. The combination of the grooved standard C, movable mold-boards G G, rods *d d*, and handles H H, all substantially as and for the purposes herein set forth.

138,198.—*Injector for Steam-Generators.*—SAMUEL RUE, Jr., Philadelphia, Pa. Application filed February 28, 1873.

The auxiliary steam-jet pipe, by which the action of the injector is started, passes around the heads of the adjustable and discharge tubes through the overflow or a pipe supplementary thereto.

Claim.—1. The steam-pipe S, extending through the head C from the top thereof around the ends of the tube H and pipe D into the tube R, substantially as and for the purpose set forth.

2. The combination, with the adjustable tube H and pipe D, of the steam-pipe S, arranged in the overflow and projecting into the tube R, substantially as and for the purpose set forth.

138,199.—*Injector for Steam-Generators.*—SAMUEL RUE, Jr., Philadelphia, Pa. Application filed February 28, 1873.

A tubular passage in the head next to the generator connects the adjustable tube with the discharge-tube. An opening in this passage communicates with the overflow, and is closed by a valve when no water is overflowing, thus preventing the entrance of air. The lever and the adjustable tube are so constructed that they may be reversed, and are thus applicable to either a right or left hand injector.

Claim.—1. The rotating tube H and removable lever M, in combination with the heads B C and bed-plate A, substantially as and for the purpose set forth.

2. The tubular passage T, situated in the overflow-passage O, in connection with the opening *t* and valve V, substantially as and for the purpose set forth.

138,200.—*Steam-Heater.*—EDMUND RUSSELL, Brooklyn, N. Y. Application filed January 22, 1873.

The radiators are screwed into the base like ordinary tubes. The inner sides of each radiator are connected by pipes to facilitate the circulation of steam. The several parts, excepting the plug, are cast in one piece.

Claim.—1. The cross-connections A^4, A^5, &c., arranged, as shown, at different levels between the branches A^3 A^3 and adapted to allow the steam to circulate first in a short length and afterward in a longer length of the radiator, as herein specified.

2. The within-described construction and arrangement of all the parts A^1, A^2, A^3, A^4, A^5, &c., when formed in a single casting, as herein set forth and described.

138,201.—*Portable Punch.*—JOHN J. SAFELY, Ottumwa, Iowa. Application filed March 14, 1873.

This punch is particularly adapted to the punching of round or rectangular holes in the web of railroad rails. The punch is held in such manner that it will not rotate, and is pushed through the rail by means of a screw. The die and punch are of the same contour as the web, in order that the pressure may be equal on the punch, to prevent breakage.

Claim.—1. The device, consisting of a clamp, B, right-handed screw C, the left-handed screw-cap *a*, punch *d*, and die *c*, all constructed as herein described, for the purposes set forth.

2. The combination with each other, within a clamp, of a cylindrical die, punch, and cap, the die, punch, and the cap which incloses the punch being removable and interchangeable, and also being provided with flat or convex ends, so as exactly to fit the web or contour of the rail to be punched before the punching process is begun, all substantially as herein described.

138,202.—*Guide for Cutting Out Photographs.*—JOHN SCHOFIELD, Philadelphia, Pa., assignor to JOHN HAWORTH and THOMAS H. MCCOLLIN, same place. Application filed January 25, 1873.

A guide-tool, provided with a rim of oval or other shape, beveled to a sharp edge, and a handle, is employed in connection with a cutting instrument for the purpose set forth.

Claim.—The guide, consisting of the rim A and handle B, constructed and arranged substantially as and for the purpose described.

138,203.—*Spring-Fastener for Bed-Bottoms.*—DAVID A. SCOTT, Cincinnati, Ohio. Application filed November 5, 1872.

The spring-fastener or clasp has a curved groove in which the bent ends of the springs are inserted. It has a central bearing and a sharpened edge that sinks into the bar.

Claim.—The spring-fastener A, formed with the central bearing, the sharpened edge or rim, and the laterally-curved groove to receive the bent end of the spring resting upon the bar B, substantially as and for the purpose set forth.

138,204.—*Vault-Cover.*—THEODORE SHARTS, New York, N. Y. Application filed March 20, 1873.

The spurs retain the concrete filling when the cover is reversed, and the shouldered flanges surround and firmly retain the bull's eye in place for the same purpose.

Claim.—In a vault-cover or sidewalk, the base-plate A filled with concrete, and provided with the obliquely arranged spurs *b b*, holes *d d*, and shouldered flanges *e e* formed as shown, for the reception of bulls'-eyes *c*, substantially as described, for the purpose set forth.

138,205.—*Suspender for Fly-Guards upon Horses.*—GILLUM SHELTON, Normal, Ill. Application filed March 8, 1873.

Claim.—The above-described straps or suspenders F and F′ for fastening and supporting the coverings of the legs of animals, substantially as set forth.

138,206.—*Saw-Mill Carriage.*—BENJAMIN F. SMITH and JAMES B. SMITH, Webster, Mass. Application filed April 4, 1873.

The setting-bar is retracted by means of a chain winding upon a windlass, which is operated by means of a friction-wheel coming in contact with a vibrating bar.

Claim.—The combination, with angle-lever L and friction-lever K, of foot-piece 2 and spring 4, substantially as and for the purposes set forth.

138,207.—*Breech-Loading Fire-Arm.*—DEXTER SMITH, Springfield, Mass. Application filed April 4, 1873.

Claim.—1. As a means of giving the extractor an accelerated movement, the lever *a* pivoted to the breech-block and operating against a stop, *s*, or its equivalent, by the downward movement of said block, substantially as described.

2. As a means of forcing back the fire-pin, the sliding bar *w′*, operating in the breech-block and against the frame, or a shoulder therein, by the downward movement of the said block, substantially as set forth.

138,208.—*Toy-House.*—JOSIAH B. SMITH, Chicago, Ill. Application filed October 28, 1872.

The box forms the foundation upon which the toy-house is built. When the house is taken apart the pieces are packed in the box.

Claim.—The toy-house herein described, consisting of the box A B, in combination with the frame and panel-pieces, so constructed that they can readily be taken apart or put together, substantially as specified.

138,209.—*Baby-Jumper.*—ALVAH F. SPOONER, Sterling, Ill. Application filed February 5, 1873.

The frame is made of a bar having a ring at the top, a bend near the middle for the child's head, and a projecting arm at the bottom to which the saddle is secured. The waistband is strengthened by a metallic plate, and is made adjustable on the upright bar by means of a metallic strap and a piece of rubber or leather. The clasps that hold the rubber spring are corrugated on their inner faces and made with one detachable side.

Claim.—1. The frame A, formed of a half-round metal bar, in the shape shown, with bend *a*, and ring *b*, and the saddle B, substantially as and for the purposes herein set forth.

2. The waistband C, constructed as described, with stiffening-plate *d*, and movable upon the frame A by means of the metal strap *f* and piece *e* of leather or rubber, all as and for the purposes herein set forth.

3. The combination of the elastic strap E and the clasp G, corrugated on its inner side and with a movable side, A, substantially as and for the purposes herein set forth.

4. The combination of the frame A, saddle B, waist-strap C, supporting-strap D, elastic strap E, and clasps G G, all constructed and arranged substantially as and for the purposes herein set forth.

138,210.—*Hay and Cotton Press.*—GEORGE W. STEWART, Atlanta, Ga., assignee of three-fourths his right to JESSE A. ANSLEY and HENRY LEWIS, same place. Application filed March 3, 1873.

The press-frame is pivoted below to the standard, upon which it rests and revolves, and by being wound around the ends of the levers are drawn inward so as to raise the platen. By reversing the motion of the press the platen will be lowered to its normal position.

Claim.—1. The combination of the standard T provided with the bearing-collar *t*, the press-frame shown pivoted upon said standard, the platen Q, the levers R, the rollers S, the pulleys *r*, and the cord W, substantially as and for the purpose specified.

2. The posts A, cross-bars B, and sills D provided with the sockets C, when said parts are constructed and combined substantially as and for the purpose shown and described.

3. The device as a whole, when its several parts are constructed and combined substantially as and for the purpose shown.

138,211.—*Horse Hay-Fork.*—HIRAM C. STOUFFER, Canfield, Ohio. Application filed September 21, 1872.

Two parts, each resembling the letter S, with part of the lower curve left off and the middle prolonged, are pivoted together near the lower end of the upper curve, ready for insertion when the points of the inner tines are overlapping, in consequence of which they diverge, but converge with outer tines as the fork is forced into the hay, thus inclosing two bunches, in which position they are locked by a toggle-joint and levers.

Claim.—The slotted toothed toggle D′, toggle D, lever G, clevis A, and double-tined jaws F F′, combined and arranged substantially as specified.

138,212.—*Hopper for Grinding-Mills.*—GEORGE S. THOMPSON, Philadelphia, Pa. Application filed July 5, 1872.

The hopper, with the spout as constructed, prevents the material from obstructing or sticking, and feeds it easily and freely to the stones, and admits it to be raised and lowered.

Claim.—The hopper B, in combination with the spout C, having a cylindrical exterior and a tapering or conical interior, both rising and lowering and adjustable together, substantially for the purpose shown and described.

138,213.—*Brush.*—PHILIPP WAGNER, New York, N. Y. Application filed March 13, 1873.

A paint-brush with a handle, constructed with a metallic socket fitted to a wooden ring, which is fitted to the ferrule. To the ferrule is fitted and attached to its inside an annular ring or rib to secure the bristles, and the whole covered by a closely-fitted cap or cover.

Claim.—1. The metallic cap-disk D, combined with a socket, handle, and wooden ring, as and for the purpose described.

2. The brush-socket D, provided with the annular inside rib *d*, arranged in combination with the ferrule and wooden ring, as and for the purpose set forth.

138,214.—*Nut-Lock.*—WILLIAM B. WAIT, New York, N. Y. Application filed February 26, 1873.

The gravitating portion of the nut has a lateral extension, which forms the bearing-surface. The nut acts on the bolt with a leverage.

Claim.—A nut provided with the eccentric portion *a*, carrying the lateral extension *b*, arranged at right angles to the face of the nut, as and for the purpose shown and described.

138,215.—*Derrick.*—JOHN E. WALSH, New York, N. Y. Application filed March 7, 1873.

Claim.—1. In a hoisting-derrick, the removable revolving cap or head A′, when constructed and operating upon the mast A in the manner substantially as described and shown.

2. In a hoisting-derrick, the swinging arms B, in combination with the revolving cap A′ and mast A, constructed to operate in the manner substantially as described.

3. The swinging arm B, having slot *b* with ledges or tracks 1 therein, substantially as and for the purposes described.

4. The combination of the hoisting-block C, having sheaves *c* and friction-rollers 2, with the swinging arm B, having the slot *b* and ledges or tracks 1 therein, substantially as and for the purposes described.

5. The combination of the windlass D, hoisting-rope E, pulley *e*, and traveling-block C with the swinging arm B, in the manner substantially as described.

6. The combination of the windlass D, rope *g*, pulleys *e* and *g′* with the traveling block C and swinging arm B, substantially as and for the purpose specified.

7. The combination of the swinging arm B that carries the traveling hoisting-block C with the guy-ropes *h″ h″* and cleats *h‴ h‴*, substantially as and for the purpose described.

138,216.—*Machine for Rolling Scythes.*—HERVEY WATERS, Boston, Mass. Application filed September 9, 1865.

Claim.—1. A cam for controlling the position of the gage, substantially as described, which gage determines the position of the rod or bar with relation to the rolls, or the point upon the bar in the direction of its length at which the rolls shall bite upon it.

2. The system of mechanism for automatically and accurately introducing the rod to the rolls, substantially as set forth.

3. Combining with the guide or guides, which keep the rod from swaying laterally, a mechanism or device for preventing the rod from twisting.

4. A double system of die-grooves, substantially as described, for rolling the point and heel ends of scythes and similar articles, where the finishing-die grooves for each end of the scythe have substantially the same terminal form.

5. The process, as described, by which scythe-plates of various lengths may be rolled in the same suit of dies.

6. The forked roller groove for rolling the points of scythes to obviate the necessity of bending.

138,217.—*Pocket-Book.*—LUDWIG WENDT, Philadelphia, Pa. Application filed January 11, 1873.

Provided with a hinged supplemental flap, adapted to receive articles for toilet use.

Claim.—1. A supplementary receptacle or flap, B, adapted to receive and retain articles for toilet use, and connected to and forming a part of a pocket-book, A, as set forth.

2. The said flap B, constructed substantially as described, with a hinged portion, B′, for the purpose specified.

138,218.—*Slate-Washer.*—WILLIAM WESTLAKE, Chicago, Ill. Application filed March 7, 1873.

A slate-washer, having a water-receptacle, with a screw-thread upon its outer surface: a cup-like cover, for containing a sponge, also having a screw-thread, screws down over the water-receptacle. A circular plate fits over the top of the water-receptacle to cover the water-opening and air-hole.

Claim.—The sponge-receptacle A, having a screw-thread, *a*, in combination with the water-receptacle B, having a screw-thread, *d*, and with or without a top, D, substantially as and for the purpose specified.

138,219.—*Nursing-Bottle.*—GEORGE R. WHITE, Boston, Mass. Application filed April 2, 1873.

The inner suction-tube is rigid and of metal, and has a jointed piece at its bottom end. This second piece turns by gravity and reaches the bottom of the bottle in all positions. The screw-cap is provided with two flanges for securing it will with a tube or a rubber teat.

Claim.—1. In combination with the bottle *a*, the rigid center draft-tube *e*, having at its inner end the pendent loosely-swinging metal tube *f*, substantially as shown and described.

2. The screw-cap *d*, made with the two buttons or flanges *h i*, for receiving either the nipple *k* or nipple-tube *l*, substantially as described.

138,220.—*Wheel for Vehicles.*—JOHN F. WRIGHT and BENONI B. JONES, Columbus, Ind. Application filed January 21, 1873.

To clamp and hold the spokes from being drawn out or pressed in.

Claim.—In a carriage-wheel, the combination of the clamping-flanges B′ and C′, having convex bearing-surfaces *b* and *c*, with spokes, the tenons D of which are concaved at *d d*, substantially as and for the purpose specified.

138,221.—*Eyelet.*—SOLOMON W. YOUNG, Providence, R. I. Application filed April 26, 1872.

The eyelet is struck from a hexagonal blank, thus making an eyelet with a hexagonal base. Waste of metal is prevented and cutting facilitated as the die which cuts one blank also cuts parts of others at the same operation.

Claim.—1. As a new article of manufacture, an eyelet having a hexagonal flange, substantially as described.

2. The method of cutting blanks for hexagonal-flanged eyelets, substantially as described, whereby each cut of the dies on any one blank will contribute to the cutting of one, two, three or more sides of succeeding blanks, as and for the purposes specified.

REISSUE PATENTS.

5,360.—*Clothes-Wringer.*—RODNEY S. CATHCART, Cincinnati, Ohio, assignor, by mesne assignments, to THE QUEEN CITY WRINGER COMPANY, of same place.—Patent No. 131,392, dated September 17, 1872. Application filed April 4, 1873.

In the outer legs are placed cylinders which rotate freely, having screw-clamps through them. The inner legs are chamfered so as to fit a round tub.

Claim.—1. In combination with the leg A′, provided with the vertical opening *a* and transverse slot *a′*, the cylindrical nut G, and clamp-screw H, substantially as and for the purpose specified.

2. In combination with the leg A′, provided with the swiveled clamp-screw H, the leg A″, having its inner face *a″* chamfered outward and rearward, substantially as and for the purpose shown.

5,361.—*Fruit-Basket.*—STEPHEN R. CONOVER, New York, N. Y., assignor to JOHN A. MOUNT.—Patent No. 131,851, dated October 1, 1872. Application filed March 24, 1873.

The basket is made of three splints, forming a polygonal convex bottom. The splints are divided into three parts to form the open sides of the basket, and are secured at the top to inner and outer hooks.

Claim.—A basket constructed of three or more splints which are divided at their ends and crossing each other at their centers, and connected at their upper ends to a circular band so that the bottom of the basket shall assume a polygonal shape, while its top is round, as shown and described.

5,362.—*Soldering Apparatus.*—JACOB GULDEN, Key Port, N. J. Patent No. 117,770, dated August 8, 1871. Application filed January 15, 1873.

The soldering-iron is connected to an adjustable pivoted bar having a spring attached, and is held in contact with the can by means of a foot-lever.

Claim.—The combination of the soldering-iron E with the pivoted bar G, spring *h*, and standard *g*, substantially as described.

5,363.—*Ventilator.*—SERENUS C. MAINE, Boston, Mass., assignor, by mesne assignments, to MAINE'S PORTABLE VENTILATOR COMPANY.—Patent No. 100,429, dated March 1, 1870. Application filed October 29, 1872.

A rounded pipe provided with an elbow is secured in an adjustable frame, so that it can be turned in its frame and adjusted at any required angle for the purpose of deflecting the currents of air from their direct course. To regulate the flow the elbow is provided with a damper. On one side of the inner end of the pipe the metal is depressed so as to form a cup for receiving any disinfectant.

Claim.—1. A ventilator of the character hereinbefore described, whereby the currents of air are deflected from a direct course on entering the apartment to be ventilated, and are thrown upward in a vertical direction, substantially as and for the purpose set forth.

2. A ventilator provided with an adjustable frame, substantially as and for the purpose described.

3. The combination, in a ventilator, of an adjustable frame, an air pipe or pipes, and a damper or dampers for regulating the supply of air, substantially as described.

5,364.—*Screw Propeller.*—JAMES MONTGOMERY, Sing Sing, N. Y. Patent No. 23,508, dated April 12, 1859; extended seven years. Application filed March 26, 1873.

The screw-propeller is composed of a plurality of blades surrounded by a cylinder or casing which is secured to the blades by means of solid tenons projecting from the peripheries of the blades into mortises in the casing. Each propeller-blade is formed in one piece with a segment of the hub.

Claim.—1. A screw-propeller composed of a plurality of blades surrounded by a cylinder or casing, secured by means of solid tenons projecting from the peripheries of the blades into mortises in the casing, substantially as described.

2. The propeller-blades B, each formed in one piece with a segment, *b*, of the hub, in combination with a surrounding cylinder, C, substantially as set forth.

5,365.—*Lappet-Loom.*—FREDERICK W. NEWTON, South Orange, N. J., assignor, by mesne assignments, to WM. L. POMEROY and JOHN F. PLUMMER.—Patent No. 64,753, dated December 8, 1868. Application filed August 29, 1871.

To enlarge the scope of the pattern mechanism it is separated from the stitching mechanism, each being actuated and its speed adjusted independently of the other. The rim of the pattern-wheel is removable and acts upon a lever connected with the traverse bar which carries the needle-bar, and the fulcrum of this lever is made adjustable to regulate the traverse of the needles. The stitching mechanism is fixed on bearings independent of the lay, but on the same axis, and the ratchet-wheel is provided with projections which act upon the stitch-bar and are made adjustable for the purpose of using stitches of different lengths. The stitch-wheel is held, when not positively moved, by means of a disk carried on a friction-sleeve on the shaft, and the pawl which actuates it is made in two parts, one adjustable upon the other. The stitching-wheel acts upon the traverse bar through a lever-arm, to which is attached a wire having a bight around a pinion-pulley in gear with the traverse bar. When the lever is drawn back it tightens the wire on the pulley and revolves it sufficiently to give the traverse-bar the required lateral movement. To give a uniform delivery of the whip-yarn it is passed between friction-rollers, which are moved laterally with the traverse-bar, so that the yarn is always directly under the needles. The whip-yarn is given out to the needles in definite quantities by means of a combined ratchet and pinion and a rack operated by the lay; and to adjust this quantity a double wedge-bar works vertically in the rack, so reciprocating it that as more yarn is taken up by the rollers less remains for the stitch. In weaving borders for gored skirts the warp is put upon conical spools and the fabric taken up on rollers of corresponding shape. The required irregular movement of the pin-bar is obtained by means of an eccentric lifting-roller.

Claim.—1. The combination of the pattern mechanism with the stitching mechanism, when the two are actuated by different powers, or are connected with the same power by intermediate gearing or attachment, so as to give to each mechanism a motion distinct from the other, and so that the speed of each may be adjusted independently of the other, substantially as described.

2. The combination of the stitching mechanism with the pattern mechanism, when the stitching mechanism is fixed on bearings independent of the lay, but is operated on the same axis as the lay itself, substantially as described.

3. The combination of the driving or stitch wheel U with the spur-wheel Y, pinion Z, pattern-wheel *b*, substantially as described.

4. The lever *e* with adjustable fulcrum, in combination with the traverse-bar M and needle-bar for regulating its movements, substantially as described.

5. The friction-sleeve having an upright stand, in combination with the pattern and stitch wheels and traverse-lever *e*, substantially as described.

6. The combination, with the stitching mechanism, of the adjustable pawl Q, constructed and operating substantially as described.

7. The stitching mechanism provided with removable cams, swells, or sliding projections, one or more, when combined with a pattern mechanism operating independently of the stitching mechanism.

8. The combination of the removable pattern-rim *c* and the pattern-wheel *b* and the stitching mechanism, arranged and operating substantially as described.

9. The combination of the independently-acting stitching and pattern mechanisms with the traverse-bar M, substantially as described.

10. The combined pinion and friction-wheel N in combination with the friction-wire, substantially as described, and for the purpose set forth.

11. The friction rollers or cylinders, one or more, for the purpose of giving a definite yet adjustable quantity of whip-yarn in a direct line to the needles, substantially as described.

12. The combined ratchet and pinion wheel G, in combination with the rack H, substantially as and for the purpose set forth.

13. The double wedge-bar I, for the purpose of regulating the quantity of whip-yarn to be furnished to the needles, substantially as described.

14. The lever *n*, in combination with the bar O and its pin for raising the double wedge-bar, substantially as described.

15. The combination of the mechanism which makes the stitch with the mechanism which gives the whip-yarn to the needles, arranged and connected substantially as described, so that the motion of the mechanism which gives off the whip-yarn to the needles may be regulated and controlled by the stitching mechanism sliding or traversing the let-off roller or rollers, so as to bring the whip-yarn at all times in a line with the needles.

16. The conical spools *o* combined with the stitching and pattern mechanisms and needle-bars, substantially as described.

17. The roller *j* of irregular or cam-shape, in combination with the pin and needle-bars, for the purpose of giving them an irregular motion, substantially as described.

5,366.—*Hub for Vehicles.*—ALMON WARNER, Belvidere, N. J., assignor, by mesne assignments, to ELIHU HALL & CO.—Patent No. 61,900, dated February 5, 1867; reissue No. 4,642, dated November 21, 1871. Application filed July 1, 1872.

A mortised wooden hub, surrounded near the middle by a metallic band having tapered mortises.

Claim.—1. The band composed of the parts B and C and the webs which connect them, constructed substantially as hereinbefore described, whereby tapered mortises are formed between the said rings and the said webs, substantially as hereinbefore set forth.

2. The combination of the band hereinbefore described, having continuous radial rings and tapered mortises, with the hub *a* and spokes extending through the said tapered mortises into the said hub A, substantially as hereinbefore set forth.

3. The combination of the band hereinbefore described, having continuous radial rings and tapered mortises, the hub A, and spokes mortised into the said hub, substantially as hereinbefore set forth.

4. The combination of the band, having tapered mortises therein, with the hub A, also having tapered mortises, substantially as hereinbefore set forth.

5,367.—*Process and Apparatus for Puddling Iron and Steel.*—JAMES G. BLUNT, Leavenworth, Kans., assignor of one-half interest to MERRITT H. INSLEY, same place.—Patent No. 129,268, dated July 16, 1872. Application filed April 17, 1873.

Petroleum vapor is conveyed by pipes into the combustion-chamber where it ignites, and the flame passes in a thin sheet into the boiling-oven.

Claim.—1. The combustion-chamber B, in combination with the boiling and reheating oven A and the central smoke-stack H, substantially as described, and for the purposes set forth.

2. The gas-pipe *b* and blast-pipe *c*, in combination with the combustion-chamber B, oven A, and stack H, substantially as described, and for the purposes set forth.

3. The process herein described of puddling and refining iron, the same consisting in subjecting the metal in the hearth of the furnace to the action of petroleum vapor or gas as fuel, either alone or in conjunction with superheated steam, mixed with a proper amount of air to effect combustion and produce intense heat, substantially as described and set forth.

5,368.—*Ruffling Attachment for Sewing-Machines.*—DE WITT C. CAREY, Chicago, Ill., assignor to WM. G. WILSON, Cleveland, Ohio. Patent No. 58,376, dated October 2, 1866. Application filed February 7, 1873.

The ruffling-plate is moved forward toward the presser by the spring, and is moved in the opposite direction by the strap, which is connected with a projection from the top of the needle-bar by means of a clamp-screw.

Claim.—1. A gathering and ruffling attachment for sewing-machines in which the reciprocatory gathering-blade is actuated from or by the needle arm or bar of the machine, substantially in the manner and by the means shown and described.

2. The combination, substantially as herein described, in a gathering or ruffling attachment for sewing-machines, of a frame adapted to be applied to and removed from the sewing-machine at pleasure, and a reciprocatory gathering-blade arranged to move toward and away from the needle, and actuated from or by the needle arm or bar of the machine by means substantially as and for the purposes set forth.

3. The curved or segmental guide A in the described combination with the bar B carrying a ruffling-plate, L.

4. The spring R, in combination with the curved and segmental guide A, the ruffling-plate L, and bar B, substantially as and for the purposes set forth.

5. The connecting-strap T connected to the head of the needle-bar or other suitable needle-operating mechanism to actuate the ruffling device, substantially as described.

6. In combination with the aforesaid ruffling mechanism A, B, L, and the connecting-strap R, the slotted bar S and clamp-screw C for varying the fineness of the ruffling.

5,369.—*Reservoir-Stove.*—HENRY F. T. HALE, Bay City, Mich.—Patent No. 44,183, dated September 13, 1864. Application filed January 2, 1873.

Cold air enters at the bottom of the stove, and is heated in its passage through.

Claim.—1. The hollow vertical grate-bars, in combination with the chamber O', substantially as shown.

2. The small pipes *e*, in combination with the chamber O' and air-chamber C', and hollow grate-bars, substantially as and for the purposes set forth.

3. The arrangement of the hollow vertical grate-bars with the flues Q, D D, and E, substantially as described.

4. The flat air-chambers *x*, for supplying the front vertical grate-bars of the fire-pot with air, substantially as and for the purposes set forth.

5. The fuel-reservoir A, open annular chambers C C' *c*, flue Q, chamber O', flues or pipes H E, and the vertical bars and the horizontal grate, all combined and arranged as described, for the purpose set forth.

5,370.—*Window-Button.*—ALBERT D. JUDD, New Haven, Conn. Patent No. 112,717, dated March 14, 1871. Application filed November 26, 1872.

The lever, its journals, and the bearing-surfaces, to actuate a spring, are cast in a single piece. An opening in the case admits the journal with its bearing-surface, and allows the straight spring, which serves to actuate the lever, to be inserted from beneath.

Claim.—1. The sash-fastening lever, neck or journal, and spring bearing, cast in one piece, substantially as set forth.

2. And in combination with the above, the sash-fastener plate, with an opening for receiving the neck or journal of the lever, and for passing the spring bearing in below the plate, substantially as specified.

3. The sash-fastening containing the lever, neck or journal, and spring bearing cast in one piece, and retained within the plate by the spring, substantially as set forth.

5,371.—*Operating Screw-Propellers.*—AMOS LEE, White Marsh, Pa.—Patent No. 132,588, dated October 29, 1872. Application filed January 30, 1873.

Claim.—A frame carrying two propellers and mechanism for driving them in opposite directions, adapted to be connected with and to be adjusted vertically on a canal-boat or other vessel, substantially as described.

5,372.—*Draw-Bridge.*—LOUIS SCHNEIDER, Williamsport, Pa., and JOHN A. MONTGOMERY, Springfield, N. J., assignors to LOUIS SCHNEIDER.—Patent No. 29,917, dated September 4, 1860. Application filed March 17, 1873.

The bridge is balanced on a central pivot, and steadied in its position by a wheel running on rollers. Around this wheel passes a chain carried over pulleys and weighted at its lower ends, by which means the bridge is returned to its normal position when turned aside in either direction from any cause.

Claim.—A turning bridge, constructed substantially as hereinbefore set forth, so as to be swung open by a vessel passing in either direction, and automatically closing itself as soon as the vessel has passed.

5,373.—*Turn-Table for Railroads.*—WILLIAM SELLERS, Philadelphia, Pa.—Patent No. 19,717, dated March 23, 1858; reissue No. 582, dated August 10, 1858; extended seven years. Application filed March 15, 1873.

The turn-table is formed of a quadrangular metallic box supported on a central pivot, and carrying four arms projecting in pairs from opposite sides of the box. The arms are detachable for ready transportation, and are attached by means of screw-bolts, and also by double-headed T-links and keys, said links extending from one arm to the opposite arm and resting in a socket formed in the top surface for that purpose. The arms are connected at their outer ends by cross-girts and supported by track-wheels in the usual manner.

Claim.—1. The combination of a central box with four beams, which are rigidly secured at their inner extremities to the said box, and project from the corners thereof in parallel lines.

2. The combination of the beams in two parallel lines with the central box, in such a manner that portions of the box are interposed between transverse bearing-surfaces of the beams.

3. The combination of four beams, a central box, two cross-girts, and track-wheels, in such manner that the beams are connected at their inner extremities in two parallel lines by the box, and at their outer extremities by the cross-girts, and that the track-wheels are arranged near the outer ends of said beams.

4. The combination of the beams, the links, and the keys, substantially as before set forth.

5. The combination of the central box, the cap-plate, the socket-plate, the suspending adjusting-bolts, and the central pedestal, substantially as before set forth.

6. The combination of the central box, the cap-plate, the socket-plate, the anti-friction rollers, and the central pedestal, substantially as before set forth.

5,374.—*Coffin-Handle.*—CLARK STRONG, Winsted, Conn.—Patent No. 97,827, dated December 14, 1869. Application filed April 10, 1873.

The tubular handle and levers are secured together by tips, which are driven in so as to firmly bind all three pieces without the use of screws or rivets or fastenings of any kind.

Claim.—1. The use of double sockets C C, in combination with the arm of the coffin-handle, substantially as shown and described.

2. Providing the arms B with pivots *e e*, formed of pieces of wire, and having a right-angled flattened shank placed together, so that when the arm is cast upon them there will be an equal thickness of metal on both sides thereof, substantially as described.

3. Securing the handle A to the arms B B by means of the tips F driven into the ends of the handle, substantially as set forth.

5,375.—*Breech-Loading Ordnance.*—ELIHU A. SUTCLIFFE, New York, N. Y.—Patent No. 39,586, dated August 18, 1863. Application filed February 11, 1873.

A mortise is made at right angles to the bore of the gun, in which a circular breech-stopper is moved to open and close the breech by a pin on the front end of the hollow breech-screw.

Claim.—1. A circular breech-stopper, moving laterally, in combination with mechanism, substantially as specified, for giving such movement in opening and closing the breech.

2. The tubular breech-screw A and pin *i*, in combination with the breech-stopper *s* within the lateral mortise of the gun, substantially as specified.

5,376.—*Hame-Tug Clip.*—JOHN B. WELTON, Tabor, Iowa.—Patent No. 125,237, dated April 2, 1872. Application filed June 1, 1872.

The spring fitting against a shoulder upon the bolt prevents its turning and consequent retraction, except by design.

Claim.—1. A tug-clip, consisting of a twisted body or open loop and a removable coupling-bolt, as a new article of manufacture, substantially as hereinbefore set forth.

2. The combination, with a tug-clip, of the coupling-bolt B b^1 b^2 and spring C, constructed as hereinbefore shown and described.

INDEX OF INVENTIONS PATENTED APRIL 22, 1873.

[The numbers in parentheses denote the classification of patents.]

Acid and other vessels, cap to prevent the bursting of carbonic, (1,) J. Matthews ... 138,171
Baby jumper, (62,) A. F. Spooner ... 138,209
Barrels, &c., implement for rolling, guiding, and controlling, (40,) B. V. Tamplin ... 138,055
Bed bottom, spring, (62,) Thompson and Kendrick ... 138,056
Bed bottoms, spring fastener for, (62,) D. A. Scott ... 138,203
Bedstead, invalid, (92,) G. W. Grote ... 138,083
Bell, door, (24,) J. Harrison ... 138,151
Belt fastening, (81,) J. E. Richard ... 138,194
Boat detaching apparatus, (13,) J. M. Kilner ... 138,165
Boat detaching apparatus, (13,) F. M. Munger ... 138,041
Boiler, wash, (136,) R. Langenbach ... 138,167
Bolt mechanism for prison doors, (24,) T. R. and J. Pullis ... 138,099
Boot and shoe heel stiffening, (16,) Darrow and Walt ... 138,070
Book case, folding, (62,) R. Haskell ... 138,022
Book, pocket, (146,) L. Wendt ... 138,217
Boot, plow, (16,) C. H. Ricker ... 138,196
Bottle, nursing, (156,) G. R. White ... 138,219
Bottle washing apparatus, (1,) Schlich and Feyh ... 138,046
Box cover, blacking, (16,) J. B. Shaler ... 138,102
Box opener, (29,) L. Mills ... 138,177
Button, (23,) F. Washbourne ... 138,107
Bridge, draw, (21,) L. Schneider, (reissue) ... 5,372
Bridge railings, baluster for iron, (21,) Sellers and Manly ... 138,049
Brush, (22,) P. Wagner ... 138,213
Canal, (82,) H. Hill ... 138,156
Car brake, (122,) J. N. Brush ... 138,196
Car brake, (122,) E. Farnsworth ... 138,141
Car, convertible freight, (122,) T. Fegg ... 138,142
Car heater and ventilator, railroad, (134,) C. F. Whorf ... 138,062
Car wheel, (122,) H. Merrill ... 138,036
Card machine, postal, (54,) J. M. D. Keating ... 138,028
Carriage axle box, (31,) Jones and Dunkerley ... 138,091
Carriage door, (31,) J. Cunningham ... 138,008
Cart, dumping, (31,) B. Fitzhugh ... 138,013
Cartridges, capping and uncapping, (32,) J. F. Nettleton ... 138,180
Cement for roofing, water proof plastic, (153,) G. Howland ... 138,159
Chair, folding, (62,) A. C. Boyd ... 138,124
Chair, school, (62,) E. J. Piper ... 138,190
Chocolate, soluble, (53,) J. Corell ... 138,007
Churn, (45,) W. H. Holdam ... 138,089
Churn, reciprocating, (45,) M. Litty ... 138,168
Cigar holder, (160,) T. J. Lewis ... 138,032
Clothes pounder, (91,) S. Hinkel ... 138,024
Clothes pounder, (91,) D. W. Rawson ... 138,044
Clothes wringer, (91,) R. S. Cathcart, (reissue) ... 5,360
Clutch for machinery, (87,) W. B. Duckworth ... 138,139
Clutch mechanism, friction, (87,) J. J. Coburn ... 138,075
Cock, check valve and blow-off, combined stop, (148,) E. G. Cushing ... 138,077
Coffin handle, (39,) C. Strong, (reissue) ... 5,374
Cooler, beer, (19,) A. F. Rick ... 138,195
Cooler, milk, (45,) W. Hodgdon ... 138,088
Corn sheller, (50,) Brown and Shangle ... 138,125
Coupling, universal, (67,) H. S. Leland ... 138,031
Cradle, automatic, (62,) I. Goldman ... 138,144
Cultivator, (43,) J. Helm ... 138,085
Curtain fixture, (62,) T. Symonds ... 138,054
Curtain roller holder, (62,) B. G. Fitzhugh ... 138,014
Cutter bars in grinding, holding, (70,) W. H. Daniels ... 138,186
Dentist's tool, (46,) C. P. Grout ... 138,150
Derrick, (79,) J. E. Walsh ... 138,215
Desk and seat, school, (62,) A. E. Roberts ... 138,045
Drawer, (38,) B. J. Greely ... 138,017
Dredger, (82,) E. B. Bishop ... 137,998
Drill, grain, (183,) J. King ... 138,160
Door locks, strike or keeper for, (93,) J. Scott ... 138,048
Dyeing with aniline black, (11,) J. Higgin ... 138,155
Egg beater, (68,) N. C. Miller ... 138,094
Elevator, (79,) A. C. Horron ... 138,154
Elevator, grain, (79,) H. Merrill ... 138,175
Eyelet, (25,) S. W. Young ... 138,221
Fabrics, machine for uniting the selvages of knit, (134,) T. Beven ... 137,997
Faucet, self closing, (167,) A. and E. Buckman ... 138,128
File, paper, (146,) R. Henning ... 138,086
Fire arm, breech loading, (18,) Holt and Marshall ... 138,157
Fire arm, breech-loading, (18,) D. Smith ... 138,207
Fire arm, revolving, (123,) G. W. Schofield ... 138,047
Fire escape, (30,) G. H. Shaw ... 138,051
Fire extinguisher, boiler, (148,) J. D. Breenihan ... 138,083
Fire place back, (154,) G. W. Cummings ... 138,135
Fire proof ceiling and floor, (4,) J. W. Bassett ... 138,118
Fire proof floor and chimney connection, (4,) W. Neracher ... 138,096
Fork, horse hay, (77,) H. C. Stouffer ... 138,211
Fruit basket, (63,) S. B. Conover, (reissue) ... 5,361
Furnace, cupola, (85,) J. B. Pearse ... 138,184
Furnace, hot air, (154,) C. L. Pierce ... 138,188
Furnace, hot air, (154,) C. L. Pierce ... 138,189
Gas light and pressure indicator, (66,) W. W. Goodwin ... 138,016
Gate, automatic, (52,) N. Long ... 138,033
Gate, iron fence, (52,) C. T. Bush ... 138,087
Generator, gas, (66,) D. H. Irland ... 138,160
Generators, injector for steam, (148,) S. Rue, Jr ... 138,198
Generators, injector for steam, (148,) S. Rue, Jr ... 138,199
Generator, steam, (148,) R. Hooper ... 138,085
Grater, (88,) G. Booth ... 138,122
Grater, nutmeg, (88,) A. L. Platt ... 138,191
Grater, vegetable, (88,) G. Booth ... 138,123
Gun lock, (18,) C. Gordon ... 138,145
Hame tug clip, (72,) J. P. Welpton, (reissue) ... 5,376
Harness, breast collar for, (72,) H. B. Morrison ... 138,039
Harness, check hook for, (72,) H. A. Carlton ... 138,003
Harvester, (74,) S. L. McCollock ... 138,172
Harvester, corn, (75,) S. Patton ... 138,181
Harvester, cutter, (74,) C. Pomeroy ... 138,192
Hats and caps, ear covering for, (76,) B. R. Morse ... 138,040
Heater, steam, (147,) E. Russell ... 138,200
Hedge trimmer, (52,) S. B. Turner ... 138,106
Hemmer, (134,) E. S. Yentzer ... 138,064
Hinge, gate, (24,) W. G. Franklin ... 138,081
Hinge, lock, (24,) M. C. Lee ... 138,092
Horse hoof paring machine, (60,) G. W. Schafer ... 138,101
Horse power, (150,) A. G. Waterhouse ... 138,108
Horses, suspender for fly guards upon, (144,) G. Shelton ... 138,205
Hub, vehicle, (31,) A. Warner, (reissue) ... 5,366
Injector for steam engines, (148,) S. Rue, Jr ... 138,196
Injector for steam engines, (148,) S. Rue, Jr ... 138,199
Iron beam, wrought, (21,) L. Kirkup ... 138,089
Iron and steel, apparatus for puddling, (85,) J. G. Blunt, (reissue) ... 5,367
Jack, lifting, (79,) W. M. Doty ... 138,078
Jack, lifting, (79,) H. H. Warren ... 138,058
Journal, anti-friction, (87,) M. E. Dayton ... 138,011
Knife, corn stalk, (40,) J. M. Brick ... 138,060
Knife, pocket, (44,) H. Staude ... 138,052
Lamp, (90,) G. Brownlee ... 138,070
Lamp, (90,) J. A. Pease ... 138,185
Latch handle, door, (93,) Ambrun and Olfermann ... 138,112
Lathe for wood, turning, (175,) C. A. Blessing ... 137,999
Leather boarding machine, (92,) O. Coogan ... 138,133
Lock for drawers, &c., (93,) E. G. Gory ... 138,148
Loom shuttle binder, (95,) Hammond and Tucker ... 138,090
Loom, lappet, (95,) F. W. Newton, (reissue) ... 5,365
Loom temple, (95,) N. Chapman ... 138,004
Loom for weaving wire, (95,) S. Holdsworth ... 138,090
Lubricator, (87,) Lunkenheimer and Meehan ... 138,169
Marble slabs, machine for molding the edges of, (153,) J. Finn ... 138,079
Mill hopper, grinding, (57,) G. S. Thompson ... 138,212
Mill pick, (153,) E. S. Forgy ... 138,080
Mill, rolling, (125,) J. E. Atwood ... 138,114
Millstone dress, (57,) J. P. Harris ... 138,021
Millstone spindles, oiling, (57,) J. J. Chubb ... 138,074
Millstones, device for cooling, (57,) Shanton and Shaver ... 138,050
Miner's bar, (124,) R. B. Platt ... 138,098
Mirrors, adjusting signaling, (158,) M. M. Kenney ... 138,162
Molding machine, (173,) J. W. Gheen ... 138,015
Music notation, (102,) E. P. Stewart ... 138,104
Neck tie, (38,) R. R. Parker ... 138,097
Nut lock, (14,) W. B. Walt ... 138,214
Nut machine, (14,) J. Braun ... 138,065
Ordnance, breech loading, (105,) C. Gordon ... 138,146
Ordnance, breech loading, (105,) E. A. Sutcliffe, (reissue) ... 5,375
Oven, bake, (6,) J. J. Piggott ... 138,042
Oyster dredge, (143,) I. A. Ketcham ... 138,164
Paper machines, suction apparatus for, (108,) W. McLaughlin ... 138,173
Pavement, (110,) D. C. Heller ... 138,023
Pavements, laying concrete, (110,) J. W. and H. W. Krause, Jr ... 138,030
Photographs, guide for cutting out, (111,) J. Schofield ... 138,202
Piano forte bridge, (112,) W. C. Ellis ... 138,019
Piano hammers, capping, (112,) L. Bullard ... 138,001
Pipe tongs, (100,) A. H. Jarecki ... 138,161
Pipes, mold for earthen, (20,) P. McIntyre ... 138,035
Pipes, &c., liquid for heating by means of, (147,) Grimm and Corvin ... 138,082
Planter, corn, (133,) G. O. Houck ... 138,158
Planter, cotton, (133,) W. Price ... 138,043
Planter, seed, (133,) I. T. Suggs ... 138,105
Plow, (114,) J. M. Cobb ... 138,131
Plow, (114,) J. Roop ... 138,197
Pools, &c., apparatus for cleaning ooze, (98,) W. C. McCarthy ... 138,034
Press, embossing, (54,) G. Clisbee ... 138,130
Press, hay and cotton, (7,) G. W. Stewart ... 138,210
Propeller, screw, (139,) J. Montgomery, (reissue) ... 5,364
Propellers, operating screw, (139,) A. Lee, (reissue) ... 5,371
Pump, mining, (118,) G. E. Mills ... 138,037
Punch, portable, (120,) J. J. Safely ... 138,201

Railway snow plow, (122,) O. D. Baird 138,116
Rake and tedder, combined, (77,) R. J. Colvin 138,132
Refrigerator, (5c,) D. Mulcahy 138,095
Rule, square, and bevel, combined, (29,) C. M. Heffron 138,152
Sash holder, (34,) L. A. Tuttle 138,057
Saw mill carriage, (130,) B. F. and J. B. Smith 138,206
Saw scroll, (130,) B. B. Smith 138,103
Saw sharpening machine, (131,) Davidson and Winningham 138,137
Sawing machine, hand, (130,) O. Bonney, Jr 138,121
Scissors, (44,) A. Whittemore 138,061
Scow, dumping, (13,) A. T. Morris 138,179
Screws, machine for making machine, (171,) J. Braun 138,067
Scrolls, instrument for drawing, (97,) E. E. Stebbins 138,053
Scrubbing machine, (22,) S. H. Bush 138,129
Scythes, machine for rolling, (125,) H. Waters 138,216
Seat, (62,) J. Peard 138,019
Separator, middlings, (57,) A. R. Guilder 138,163
Sewing machine, (134,) M. H. Kernaul 138,073
Sewing machine chair, adjustable, (62,) F. Chichester 138,073
Sewing machine ruffling attachment, (134,) D. C. Carey, (reissue) 5,368
Sewing machine shuttle, (134,) W. Cooney 138,134
Sewing machine thread cutter, (134,) Henry and Wood 138,153
Shaft hanger, (87,) W. Bellis 138,119
Shafting, casting bearings on, (33,) J. Miller 138,176
Shoe fastening, (16,) L Banister 138,117
Shoemaker's finishing tool, (16,) Wilson and Foster 138,063
Sizing compound, (117,) T. Gorrel 138,147
Skate, roller, (143,) W. P. Gregg 138,018
Slate frames, machine for finishing, (173,) J. H. and G. S. Coffin 138,005
Slate washer, (146,) W. Westlake 138,218
Snow shovel, (110,) H. C. Cole 138,076
Soda water and sirup cock, (1,) W. Gee 138,143
Soda water apparatus, beer attachment for, (1,) W. R. Cady 138,002
Soldering apparatus, (136,) J. Guiden, (reissue) 5,362
Spikes, machine for pointing, (103,) Waldron and Moore 138,058
Square, try, (29,) W. F. Arnold 138,113
Stamps to letters, machine for affixing, (146,) Benseman and Slocum 138,120
Stereotypes, making rubber, (164,) G. H. Cooke 138,006
Stone dressing machine, (153,) G. R. Ray 138,100
Stove, cooking, (154,) A. C. Barstow 137,996
Stove, cooking, (154,) D. G. Littlefield 138,093
Stove, reservoir, (154,) H. F. T. Hale, (reissue) 5,369
Table leaf support, (62,) G. Payzant 138,182
Tanning, (92,) Davis and Armstrong 138,138
Telegraph line, subterranean, (50,) E. H. Austin 138,115
Thill coupling, (31,) G. W. Hobart 138,087
Tobacco boxes, machine for recessing, (30,) I. M. Reames 138,193
Toy, (143,) T. Morley 138,038
Toy house, (143,) J. B. Smith 138,208
Trunk, (162,) M. H. Bliss 138,000
Turn table, (120,) W. Sellers, (reissue) 5,373
Vault cover, (110,) T. Sharts 138,204
Vehicle wheel, (31,) Wright and Jones 138,220
Ventilator, (166,) S. C. Maine, (reissue) 5,363
Vessels, construction of, (137,) W. F. Morgan 138,178
Wagon, dumping, (121,) J. H. Adriaans 138,111
Wall, plaster, (4,) M. F. Lyons 138,170
Wash board, (91,) G. Elsey 138,140
Washer, spring plate, (14,) F. R. Gridley 138,149
Washing machine, (91,) J. C. Burgner 138,128
Washing machine, (91,) N. O. Wilcox 138,110
Watches, reversible pinion for, (36,) F. Pickert 138,187
Watchman's time check, (36,) T. Hahn 138,084
Weather strip, (30,) J. and G. Bacon 138,065
Well boring, artesian, (124,) W. McPherson 138,174
Windmill, (118,) W. Peck 138,186
Window, (30,) S. Darling 138,009
Window battens, (24,) A. D. Judd, (reissue) 5,370
Wire cloth, drying painted, (107,) C. H. Waters 138,060
Wood, &c., bundling kindling, (174,) H. A. House 138,026
Wood, &c., machine for bundling kindling, (174,) H. A. House 138,027
Wood finishing compound or oil, (107,) F. Webster 138,109
Work stand, (62,) C. S. Caple 138,072

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED APRIL 22, 1873.

Adriaans, J. H., Dumping wagon 138,111
Ambrun, J., and E. Olfermann, Door latch handle 138,112
Ansley, J. A., assignee 138,210
Armstrong and Davis 138,138
Arnold, W. F., Try square 138,113
Atwood, J. R., Rolling mill 138,114
Austin, E. H., Subterranean telegraph line 138,115
Bacon, J. and R., Weather strip 138,065
Baird, O. D., Railway snow plow 138,116
Banister, L., Shoe fastening 138,117
Barstow, A. C., Cooking stove 137,996
Bassett, J. W., Fire proof ceiling and floor 138,118
Bellis, W., Shaft hanger 138,119
Benseman, W., and E. Slocum, Machine for affixing stamps to letters 138,120
Berner, English & Over, assignees 138,166
Bevan, T., Machine for uniting the selvages of knit fabrics 137,997
Bishop, E. B., Dredger 137,998
Black, J., assignee 138,090
Blessing, C. A., Turning lathe for wood 137,999
Bliss, M. H., Trunk 138,000
Blunt, J. G., Process and apparatus for puddling iron and steel, (reissue) 5,367
Bollman, S. C., assignee 138 074
Bonney, O., Jr., Band sawing machine 138,121
Booth, G., Grater 138,122
Booth, G., Vegetable grater 138,123
Boyd, A. C., Folding chair 138,124
Branch, H. A., assignee 138,011
Braun, J., Machine for making machine screws 138,067
Braun, J., Nut machine 138,066
Bresnihan, J. D., Boiler fire extinguisher 138,068
Brick, J. M., Corn stalk knife 138 069
Brown, F. E., and J. R. Shangle, Corn sheller 138,125
Brownlee, G., Lamp 138,070
Brush, J. N., Car brake 138,126
Buckland, E. H. and A. A., assignees 138 157
Buckman, A. and E., Self-closing faucet 138,127
Bullard, I., Capping piano hammers 138,001
Burgner, J. C., Washing machine 138,128
Bush, C. T., Iron fence gate 138,071
Bush, S. H., Scrubbing machine 138 129
Cady, W. R., Beer attachment for soda water apparatus 138 002
Caple, C. S., Work stand 138,072
Carey, D. C., Ruffling attachment for sewing machines, (reissue) 5 368
Carlton, H. A., Check hook for harness 138,003
Cathcart, R. S., Clothes wringer, (reissue) 5,360
Caton, J. D., assignee 138,086
Chapman, N., Loom temple 138,004
Chichester, F., Adjustable sewing machine chair 138,073
Chubb, J. J., Oiling millstone spindles 138,074
Cleminson, G. W., assignee 138,007
Clisbee, G., Embossing press 138,130
Cobb, J. M., Plow 138,131
Coburn, J. J., Friction clutch mechanism 138,075
Coffin, J. H. and G. S., Machine for finishing slate frames 138,005
Cole, H. C., Snow shovel 138,076
Colvin, R. J., Combined rake and tedder 138,132
Conners, J. D. and T. K., assignees 138,191
Conover, S. B., Fruit basket, (reissue) 5,361
Coogan, O., Leather boarding machine 138,133
Cooke, G. K., Making rubber stereotypes 138,006
Cooney, W., Shuttle for sewing machines 138,134
Corell, J., Soluble chocolate 138,007
Corvin and Grimm 138,092
Coyle, H. B., assignee 138,075
Cummings, G. W., Fire place back 138,135
Cunningham, J., Carriage door 138,008
Cushing, E. G., Combined stop cock, check valve, and blow off 138,077
Daniels, W. H., Device for holding cutter bars in grinding 138,136
Darling, S., Window 138,009
Darrow, F. E., and O. E. Wait, Heel stiffening for boots and shoes 138,010
Davidson, T. L., and H. Winningham, Saw sharpening machine 138,137
Davis, J., and J. Armstrong, Process for tanning 138,138
Dayton, M. E., Anti-friction journal 138,011
Deane, E. L., assignee 138,041
Dorchester, E., assignee 138,116
Doty, W. M., Lifting jack 138,078
Duckworth, W. B., Clutch for machinery 138,139
Dunkerley and Jones 138,091
Ellis, W. C., Piano forte bridge 138,012
Elsey, G., Wash board 138,140
Farnsworth, E., Car brake 138,141
Feyh and Schlich 138,046
Finn, J., Machine for molding the edges of marble slabs 138,079
Fitzhugh, B. G., Curtain roller holder 138,014
Fitzhugh, B. G., Dumping cart 138,013
Fogg, T., Convertible freight car 138,142
Forgy, E. S., Mill pick 138,080
Foster and Wilson 138,063
Franklin, W. G., Gate hinge 138,081
Gates, W., assignee 138,072
Gee, W., Soda water and sirup cock 138,143
Gheen, J. W., Molding machine 138,015
Goldman, I., Automatic cradle 138,144
Goodell, Braun & Co., assignees 138,066
Goodell, Braun & Co., assignees 138,067
Goodwin, W. W., Gas light and pressure indicator 138,016
Gordon, C., Breech loading ordnance 138,146
Gordon, C., Gun lock 138,145
Gorrel, T., Sizing compound 138,147
Gory, E. G., Lock for drawers, &c 138,148
Greely, B. J., Drawers 138,017
Gregg, W. P., Roller skate 138,018
Gridley, F. R., Spring plate washer 138,149
Grimm, L., and J. Corvin, Liquid for heating by means of pipes, &c 138,092
Grote, G. W., Invalid bedstead 138,083
Gront, C. P., Dentist's tool 138,150
Guilder, A. R., Middlings separator 138,019
Gulden, J., Soldering apparatus, (reissue) 5,362
Hahn, T., Watchman's time check 138,084
Hale, H. F. T., Reservoir stove, (reissue) 5,369
Hall & Co., E., assignees, (reissue) 5,366
Hammond, G. B., and J. A. Tucker, Shuttle binder for looms 138,020

Hampson, G. J., assignee 138,147
Harris, J. P., Millstone dress 138,021
Harrison, J., Door bell 138,151
Haskell, E., Folding book case 138,022
Haworth, J., assignee 138,202

Yentzer, E. S., Hemmer 138,064
Young, S. W., Eyelet 138,221

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125 00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125 00 per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

COMMISSIONER'S DECISIONS.

JOSEPH H. SPERRY.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Joseph H. Sperry for a patent for* IMPROVEMENT IN SAW-TEETH.—*Decided May* 3, 1873.]

The merit of novelty cannot be accorded to a saw-blade with a socket of a spiral form for a tooth, in combination with a tooth of a corresponding form, if the drawings of a previous patent show a saw-blade and tooth so nearly resembling them that they cannot be distinguished unless by a mathematical test.

LEGGETT, *Commissioner:*

Applicant claims—

"In combination with a saw-blade, provided with a receptacle or socket of spiral form, a removable tooth, the insertible edge or periphery of which is also of spiral form, when constructed and operating as described."

Thus, applicant limits his invention to the construction of the base of his tooth, and the recess for its reception, in the form of a true spiral. The patent cited, Disston & Disston, reissue No. 3,651, so far as can be determined by an inspection of the drawing, is a perfect answer to his claim. It would require a scientific test to detect any difference between the curve of his tooth and that of the tooth referred to. There certainly can be no practical difference between the two teeth, even if there is a mathematical one. The same object is contemplated and accomplished in the form of both teeth and the recesses for their reception. The patent sets forth that "the base of the tooth is curved at the edge, the curve becoming gradually more abrupt from the point *x* at the rear to the point *y* in front, and the recess in the blade for the reception of the base is made of the same shape." The claim covers such a corresponding construction of curves of the base and recess "that pressure against the point of the tooth will tighten the base in its recess."

A patent cannot properly be allowed applicant except upon proof of priority of invention upon an interference with the patent cited. The decision of the Board is affirmed.

BENJAMIN MORSE.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Benjamin Morse for patent for* COMBINED RAKE AND PLASTER-SOWER.—*Decided May* 6, 1873.]

To place a horse-rake upon a wheeled vehicle in the usual way, and a seeding-box with its customary apparatus, does not present a patentable combination, when neither implement modifies the operation of the other.

A cam-wheel which is applied on one of the wheels of such a machine, when used as a rake to operate the teeth, and when used as a seeder upon the other wheel to vibrate the slide of the plaster-box, may be claimed as a new thing in connection with either implement.

LEGGETT, *Commissioner:*

Applicant proposes to apply upon a wheeled horse-rake a box for containing plaster and the necessary mechanism for vibrating the slide in the bottom of the box to distribute the plaster. The object is to enable the same wheels, axle, frame, and tongue to be utilized for raking and plaster-sowing, respectively. This is an advantage to farmers, in that the cost of the combined implement is less than that of two independent ones, and there is a saving of room in storing during the winter season. In the use of the device, however, there is no connection between the rake mechanism and the plaster-sowing mechanism. When one is employed the other is not. The plaster-sowing devices might be detached from the wheels and axle, and there would be left a complete and less cumbrous rake. So the rake mechanism might be removed from the carrying vehicle, and the sower would be complete. The union of the two devices upon the same vehicle works no modification of their respective functions, and has no relation to any common function to be accomplished

by their co-operation. It refers solely to the economy of carrying and storing the two machines upon the same wheels. There is therefore no patentable combination produced by the mere placing of the two machines upon the same wheels and axle, because there is no co-operation effected in their use producing a common or unitary result.

The Examiner has therefore correctly held that the subject-matter claimed cannot properly be embodied in the same patent. There is one device, however, in this case which is used in connection with both the rake and the sower, viz., "the wheel *n*" with its projections and depressions. It is to be attached to one of the rake-wheels to operate as a clutch to raise the teeth, and to the other, when the machine is used for sowing plaster, to operate as a cam for vibrating the slide of the plaster-box. It is a distinct device adapted to be applied either on a rake or plaster-sower of the kind produced by the applicant. It may be claimed in connection with either the rake or the machine for sowing plaster.

Applicant has filed an application for his "sower," and his request to have the original model serve for both applications will be granted. The Examiner should point out specifically the defects in the amendments which he has refused to enter for informality, so as to enable the applicant to understand what they are, and to correct them if they actually exist.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—NINETEENTH DISTRICT, CALIFORNIA.

HARDY AND MOORMAN *vs.* CUTTER *et als.*—*Trade-Mark.*

[*In Equity.—Before Wheeler, Judge.*]

The plaintiffs were entitled to the exclusive use of certain trade-marks including the expressions "J. H. Cutter" and "Bourbon Whisky," under which they sold an article of high reputation known as "Cutter whisky," yet the defendants were held not liable for selling whisky with labels unlike the plaintiffs' in all other respects, but inscribed with the words "J. F. Cutter," (which was the name of one of the defendants,) "son of the late J. H. Cutter," and "Bourbon whisky."

An action cannot be maintained because the defendants have sold an article inferior to the plaintiffs' in packages resembling theirs, or have sought to deceive the public.

Descriptive phrases which are in common use, like the words "Bourbon whisky," cannot be appropriated as a trade-mark.

The use of a man's own name is not actionable, though it forms part of another man's trade-mark, provided he does not do it so as to deceive the public, and uses no other material part of the trade-mark.

WHEELER, *J.*:

PURPOSE OF THE ACTION.

This action is brought to perpetually enjoin the defendants from infringing the trade-mark of the plaintiffs, and for damages.

The substantial allegations of the bill are that one John H. Cutter, in his lifetime, was the manufacturer and vender of an article of whisky known as "Cutter Whisky;" that it was a superior article, and acquired great reputation throughout the United States; that said Cutter adopted and used certain trade-marks to designate said article, and which are set out in the complaint; that in July, 1860, said Cutter assigned and transferred to the plaintiffs his stock of whiskies, and also the exclusive right to use his said name, trade-mark, and brands.

It is further averred that from the time of said assignment the plaintiffs have carried on the business of manufacturing and vending said article, and that the same has always been contained in packages impressed with the trade-marks and brands of plaintiffs. That on the boxes in which plaintiffs packed their bottled whisky was branded with a hot iron a representation of the English crown and the words "J. H. Cutter; Old Bourbon;" that plaintiffs have uniformly used printed wrappers to envelop said bottles, and which wrappers are described in the complaint. It is also averred that plaintiffs' barrels were branded in the same manner as their boxes.

After setting forth various other matters appropriate and usual in a complaint of this character, the plaintiffs proceeded to charge the defendants with a wrongful violation of their said trade-mark.

It is charged that the defendants have put up, and are offering for sale, an article in imitation of plaintiffs' article, contained in similar packages, to wit: Boxes, bottles, and barrels, and labeled with a nearly similar label, brand, and trade-mark, a specimen of which is annexed to the complaint and made a part thereof. It is also averred that defendants did these things with intent to deceive the public; that their whisky is inferior to that manufactured by plaintiffs; that they have misled the public; and that the plaintiffs have been greatly damaged thereby.

These are all the allegations of the complaint that I deem it necessary to notice for the purposes of this decision. To the complaint the defendants interposed a demurrer.

SIMULATING PLAINTIFFS' TRADE-MARK.

If this action can be maintained at all, it must be for simulating the plaintiffs' trade-mark. The mere fact that the defendants sought to deceive the public, or that they manufactured an inferior article, or that they put their whisky into boxes, barrels, or bottles similar to those of the plaintiffs, does not give to the plaintiffs a cause of action. But the offense consists in the defendants so closely imitating the trade-mark of the plaintiffs as to induce persons purchasing the defendants' goods to believe they are the goods manufactured by the plaintiffs. The inquiry, then, of chief importance is, does the complaint show that the defendants thus simulated the plaintiffs' trade-mark? In order to avoid a confusion of things which the law permits with those which it forbids, it is well to recur to a few established rules or principles.

First. It is undisputed that all persons have an equal right to manufacture and vend any article of commerce for which no patent has been issued. Second. Any word or assemblage of words in common use, which indicates the name, nature, or quality of an article cannot be appropriated as a trade-mark. Third. Every person has the right to use his own name in connection with the articles he manufactures or sells, provided he does not use it in such a way as to deceive or defraud

the public, or to obtain for himself, at the expense of another, an undue advantage.

Keeping these principles in view, (and they are not controverted,) I will now proceed briefly to examine the alleged simulation of plaintiffs' trade-mark.

It is alleged by the plaintiffs that their boxes and barrels were branded with a representation of the English crown, and with the words and letters "J. H. Cutter; Old Bourbon." It is not pretended that defendants placed upon their goods a representation of the English crown, nor the words "J. H. Cutter," and it must be admitted by all that, though defendants use the words "Old Bourbon," they had a perfect legal and moral right so to do, because these are words in common use, indicating the nature and quality of a certain article of commerce known throughout the country as Bourbon whisky.

Indeed, I do not understand that plaintiffs pretend that they have any property in these words as a part of their trade-mark.

So far, then, I do not perceive any simulation, unless it be in the use of the surname "Cutter." But of this hereafter.

UNIFORM WRAPPERS.

In addition to the brands of plaintiffs, as above stated, they allege their uniform use of certain wrappers for their bottles, copies of which are annexed to the complaint and made a part thereof. Exhibit "B" of the complaint is a copy of the wrapper used by plaintiffs on their bottles containing Bourbon whisky; the other, "C," is used on the bottles containing "Rye" whisky; and, save in this particular, the wrappers are precisely alike. I will therefore examine "B" only. This wrapper or label is of a light-brown color, and about six by twelve inches in its dimensions. Near the top are printed in large black letters the words "J. H. Cutter, Old Bourbon Whisky." Immediately under this lettering is the representation of a barrel, on the head of which are printed the words "J. H. Cutter, Old Bourbon." Under the word "Bourbon" is a representation of the British crown, and under that the words "A. P. Hotaling & Co., sole agents for the Pacific Coast." Underneath the barrel, in black shaded letters, are the words "C. P. Moorman & Co., distillers, Louisville, Kentucky." Beneath all this are eight additional lines of printed matter, in type of various sizes, and occupying a space of about three by five inches. The whole is surrounded by an elaborate border, also in black.

Copies of the labels or trade-marks alleged to have been employed by defendants, and which, it is claimed, are a simulation of the plaintiffs' trade-mark and labels, are also annexed to the complaint, marked Exhibits "D" and "E," and these Exhibits "D" and "E" are the only trade-marks that the defendants are alleged to have used or employed in and about their business.

I will first examine "D." This label is about two inches shorter and one inch narrower than Exhibit "B;" indeed, the difference in the dimensions of the two labels is so great as to be detected at a glance. In color, instead of being a light brown, it is a bright yellow. Near the top are printed the words and letters "J. F. Cutter, Extra," and immediately under the word "Extra" is a yellow star within a shield. On the left of the shield is the word "Trade," and on the right the word "Mark," and under the shield the words "Old Bourbon." This label contains no other device, letters, words, figures, or emblems. The whole is surrounded by a black border, much less elaborate than that surrounding Exhibit B, and only about half its width. This Exhibit D is used by defendants on their boxes, barrels, and casks.

Next in order is Exhibit "F." This is used by defendants on their bottles. In size it is about three by four inches. In color it is pure white, surrounded by a plain and very narrow border of black. The device and lettering are precisely like those contained in Exhibit D, except that the star within the shield is white upon a field of gray. Underneath, and within a separate border, are these words: "Notice.—This whisky has been carefully distilled from selected grain, and is bottled expressly for medicinal and family use. None genuine without the fac-simile signature of the subscriber covering the cork. J. F. Cutter, son of the late J. H. Cutter, of Louisville, Ky."

To say that either D or E is a simulation of B is, to my mind, the utterance of an absurdity that the senses of the most ordinary observer would at once rebuke. To say that a star within a shield is a simulation of the British crown is no more absurd than to contend that the American eagle is an imitation of the British lion, or that the crescent of the Turk is a simulation of the cross of the Christian. The only words used by the plaintiffs, and which have been adopted by defendants, are "Cutter" and "Old Bourbon." As shown above, defendants have an unquestioned right to the use of the words "Old Bourbon;" and this brings us to the second inquiry, viz.: Has the defendant used his own name, J. F. Cutter, improperly? Several cases have been cited where a party has been restrained from the use of his own name in connection with his own goods, but in all these cases he was guilty of appropriating the whole or material portions of the plaintiff's trade-mark in addition to the name.

In the case of *Croft* vs. *Day*, decided in the English Chancery, the defendant not only used the name, Day & Martin, under which plaintiff's business was conducted, but the colors of his labels were of the same nature as plaintiff's colors; his labels were of exactly the same size; the letters were arranged in precisely the same mode; and the very same name appeared on the face of the jars. In deciding the case the Master of the Rolls says: "The defendant has a right to the use of his own name; * * but I must prevent him from using it in such a way as to deceive and defraud the public, and obtain for himself, at the expense of the plaintiff, an undue and improper advantage." It is unnecessary to refer to the cases in detail, as the one cited above lays down the doctrine that has been uniformly followed.

J. F. CUTTER'S WHISKY.

It may be true, and probably is, that the profits of the plaintiffs have been diminished by the defendants embarking in a similar business; and this remark will apply with equal force to thousands of other cases where competition has lessened the income of established houses; and yet the law does not afford a remedy. J. F. Cutter has the same right to manufacture and vend Bourbon whisky that the plaintiffs have, and so long as he refrains from simulating their trade-mark, and uses only his own proper name, together with the

name of the article in which he deals, with an emblem or device in no way resembling plaintiffs', clearly he is acting strictly within the rights guaranteed to him by by the law of the land. From these views it follows that the demurrer must be sustained, with leave to the plaintiffs to amend within ten days, if they shall be so advised.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL F. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALSER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABRATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHNEBLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,724.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OTIS TUFTS, August 9, 1859. Hearing July 23, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,820.—*Improvement in the Manufacture of Watch-Cases*, granted to JAMES BOSS, May 3, 1859.

Claim.—1. Spinning up of watch-cases by the employment of a mandrel and spinning-wheels constructed to operate in the manner substantially as set forth.

2. Spun plated sheet-metal watch-case, constructed as herein specified.

23,875.—*Improvement in Lamp-Shades*, granted to CHARLES WILHELM and ANNA CATHARINE WILHELM, May 3, 1859; reissued August 14, 1860.

Claim.—1. The combination of the metallic shade A A′ A″ with the paper pictures C′ D′ E′ between sheets of mica, as above described.

2. The combination of the metallic frame A A′ A″ and the pictures C′ D′ E′ upon paper or any other suitable substance, substantially as above described.

3. The combination of the metallic frame A A′ A″ and the pictures C′ D′ E′ upon paper or other suitable substance and the mica lining, the whole being arranged substantially as herein set forth.

23,826.—*Skate-Fastening*, granted to JOHN COE, administrator of the estate of JOHN H. COE, deceased, and WILLIAM B. SNIFFIN, May 3, 1859; reissued March 23, 1869, numbered 3,333.

Claim.—1. The combination, with a skate, of a movable clamp and a screw, arranged transversely to the skate, for pressing the clamp against the foot or the sole of a boot or shoe, substantially as described.

2. A skate-clamp having a raised or roughened surface, or the equivalent thereof, to hold the edge of the sole of a boot or shoe with a firm gripe, substantially as described.

3. The arrangement of a skate-clamp upon a vertical stud or pivot, on which it can turn, so as to adjust itself automatically to the surface against which the clamp is drawn, substantially as shown and described.

4. The curved adjustable slotted bars E F F, combined and arranged, in relation to each other and to the foot or base-plate A, substantially as and for the purpose described.

5. The arrangement, on the screw-shaft K, of a hinged handle, L, in such a manner that it can be folded out of the way, after the skate is fastened to the foot, substantially as shown and described.

Disclaimer filed April 30, 1873.

Disclaims the second clause of claim.

23,882.—*Improvement in Cement for Roofing*, granted to NATHAN A. DYAR, May 3, 1859.

Claim.—The water-proof roof-covering herein described; the same consisting of a central layer or web of cloth, or its equivalent, covered on both sides with adhering layers of water-proofing, the outward side of one of which is covered with a layer of paper fixed thereto by contact with the water-proofing while it is in a warm and plastic state, while, upon and embedded in the outward side of the other layer of water-proofing, while in the state just described, is a layer of sand, or its equivalent, forming the uppermost or weather-surface of the article.

DISCLAIMERS FILED.

3,333.—JOHN COE, administrator of JOHN H. COE, deceased, and WILLIAM SNIFFIN, Stratford, Conn.—*Skate-Fastening*, granted May 3, 1859; reissued March 23, 1869, No. 3,333. Disclaimer filed April 30, 1873. Disclaims:

"A skate-clamp having a raised or roughened surface, or the equivalent thereof, to hold the edge of the sole of a boot or shoe with a firm gripe, substantially as described."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date April 29, 1873.]

6,613.—*Glass-Ware.*—THOMAS B. ATTERBURY, Pittsburg, Pa. Application filed April 11, 1873.

6,614.—*Knobs and Plates.*—GEORGE E. BRINGMAN, Philadelphia, Pa. Application filed February 4, 1873.

6,615.—*Stair-Rods.*—WILLIAM T. MERSEREAU, Orange, N. J. Application filed April 17, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date April 29, 1873.]

ORIGINAL PATENTS.

138,222.—*Iron Front for Stone Piers.*—JOB ABBOTT, Canton, Ohio. Application filed March 10, 1873.

The pier-nose is covered with an iron front composed of plates arranged horizontally, and having a heavy angle-bar at the front edge. The plates are held to the pier by dowel-pins having enlarged heads at their outer ends, and secured in holes in the faces of the nose by fusible metal poured in through a channel in the head for that purpose. The space between the plates and pier is filled with cement in a fluid form to give the plates a firm support by leveling the inequalities of the stone surface.

Claim.—1. The combination, with the pier-nose of a stone pier, of an iron front having a heavy angle-bar at its front edge and plate-iron sides of sufficient size to cover the faces of the pier-nose, said iron front being secured by dowels to the pier-nose at points scattered over both faces thereof, substantially as and for the purpose specified.

2. An iron front for stone pier-noses having a heavy angle-bar at its front edge and with the plates forming the sides thereof, so formed as that the battens uniting said plates shall lie in horizontal position when the front is placed on the pier, substantially as and for the purpose specified.

3. A dowel-bolt for iron pier-fronts having an enlargement at the upper part of the body thereof and a groove along the said enlargement and the head, substantially as and for the purpose specified.

4. The combination, with the front plate B and pier-nose A, of a plastic filling, K, inserted between the plate B and nose A around the dowel-hole c, substantially as and for the purpose specified.

5. The combination, with the nose of a stone pier and an iron front therefor, of a cement filling introduced in a fluid form between said front and nose, substantially as and for the purpose specified.

138,223.—*Frame for Window-Awnings.*—JAMES A. ALLEN, Philadelphia, Pa. Application filed February 12, 1873.

The upright portion of the frame extends across the top of the window so that the awning may be secured thereto, and both can be removed together when not wanted.

Claim.—The combination of the metallic frame C having parts a b b with a window-frame, the part a being connected with the head of the window-frame by means of hooks D D, and the parts b b with the jambs of the same by means of the bolts E E, substantially in the manner and for the purpose above set forth.

138,224.—*Blinder for Cattle.*—MATHIAS BACKMAYR, Lyons, Wis. Application filed January 6, 1873.

A blinder for preventing cattle and horses from jumping and tearing down fences.

Claim.—Blinder A, strap B, strap C, and girt D, all in combination, substantially as described.

138,225.—*Life-Boat.*—EDWARD A. BARRETT, New York, N. Y., assignor to himself and JOSEPH J. WALTON, same place. Application filed March 12, 1873.

Floats are made attachable and detachable to ordinary boats by bands surrounding them, which bands act as fenders, and are secured by bolts which screw into countersunk holes in plates secured permanently to the gunwales. When the floats are detached the screw-bolts and plates are flush with the gunwales, and thus offer no obstruction.

Claim.—The battens P P, provided with the permanent sockets D D and countersunk screws G G, combined with the fender-straps J J and buoyant tubes B B provided with connections at bow and stern, whereby said tubes are detachably connected to the boat, so that the same is convertible to a life or ordinary boat, as desired, as and for the purpose specified.

138,226.—*Dry-Goods Stand.*—JOSEPH J. BIGEL, Williamsport, assignor to himself and M. V. B. STEINMETZ, Lancaster, Pa. Application filed January 30, 1873.

The revolving frame consists of four angular or L-shaped bars, connected at or near both their lower and upper ends by two diagonal bars. In the center of the lower bars, where they cross each other, a hole is made for the passage of the upright standard, and to the lower side of the upper bars a conical bearing is attached for the upper end of the standard to fit into. Suitable supports are attached to the outside of the corner-bars for the reception of shelves.

Claim.—1. The revolving frame, consisting of the angular or L-shaped corner-bars D D with diagonal connecting-bars C C and E E, and provided with shelves around its outside, for the purposes herein set forth.

2. The combination of the stand A B, revolving frame C D E, supports G G, and shelves H H, all constructed and arranged substantially as and for the purposes herein set forth.

138,227.—*Dredger.*—ADOLF C. BOTH, Portland, Me. Application filed March 3, 1873.

The buckets are hinged to the connecting-rods, which are pivoted to the frame in such a manner that when the power is applied to force the buckets into the earth their cutting edges will follow the line of a long flat curve, which will make them cut easier and leave the outer circular sides of the buckets, when closed, free from contact with the cut, thus avoiding suction when the buckets are raised. The power to close the buckets is applied by means of the chain *t* to the drum, which is loose on the stationary shaft, and also has the gears fastened to it, which engage with the gears on the intermediate shaft carrying the small wheels on which are wound the chains, secured to sliding shaft, which is thus drawn down, and by means of the connecting-rods closes the buckets.

Claim.—1. The combination of the swinging connecting-rods *e e* and *d d'* and the guide segment *g*, operating as and for the purpose specified.

2. The combination of the gears *k k* and *l l* and the intermediate shaft *o*, operating as and for the purpose specified.

138,228.—*Sign for Moving Vehicles.*—ERASTUS Y. CLARK, Brooklyn, and WILLIAM A. LILLIENDAHL, New York, assignors to themselves and J. H. BEARDSLEY, Brooklyn, N. Y. Application filed September 5, 1872.

A wire-gauze sign forms a part of the side of the car, and its lettering is exposed by the illuminated interior.

Claim.—The combination, with a moving vehicle and a lamp, or equivalent illuminating device, of one or more wire-gauze surfaces provided with opaque letters, signs, or characters, substantially as and for the purpose specified.

138,229.—*Rotary Churn.*—FRANK E. CLARKSON, Highland, Kans., assignor of two-thirds his right to JOHN JACOB STRADER, Jerseyville, and GEORGE FRANCIS NELSON, Chicago, Ill. Application filed October 2, 1872.

The dasher is a rotating annulus, carrying buckets or square staples on its upper and lower faces, and downwardly-inclined deflectors are fixed to the upper part of the inner walls of the cylinder.

Claim.—The combination and arrangement of the circular dasher C, staple-shaped lugs E E E, and projections F F, substantially as shown and described.

138,230.—*Bottle for Effervescing Liquids.*—HIRAM CODD, Grove Lane, Camberwell, England, assignor of one-half his right to RICHARD BARRETT, London, England. Application filed January 21, 1873.

The bottle is provided with internal ridges in the sides of the neck to prevent the internal stopper from moving back to the mouth during the pouring of the contents.

Claim.—1. The bottle having internal ridges in the sides of the neck, substantially as before set forth, to prevent the internal stopper from moving back to the mouth during the pouring out of the contents.

2. The bottle, having the base of the neck contracted, and also internal ridges in the sides of the neck between the contracted base of the neck and the mouth, substantially as before set forth.

138,231.—*Tire-Bending Machine.*—FRANK E. COLEMAN, Kirkwood, N. Y. Application filed November 11, 1872.

The upper bending-roll is held in bearings at each end, which are raised and lowered by means of screws, which work through the frame above. The bearings slide vertically upon V-shaped grooves, and can be raised above them, where the roll with its bearings can be removed from the machine in order to take out the finished tire.

Claim.—In a machine for bending tire, in combination with the roller G and set-screws I, the posts or frame *b b b'* provided with ways or ribs *c c*, and the bearing-blocks H provided with recesses *h'* and throats *f*, substantially as set forth.

138,232.—*Lantern.*—JOHN P. CONNOR and MICHAEL T. HYNES, Boston, Mass. Application filed February 24, 1873.

Pyramidal-shaped lugs are attached to the lamp a little above its lower flange. These enter notches in the flange of the gallery. Vertical springs attached to the gallery bear against the lamp to hold it in place, and also serve as stops, against which the lugs abut.

Claim.—1. A lamp, C, provided with conical-shaped lugs or projections *d* on its sides, in combination with a casing, A, having a flange, B, provided with openings *b* to receive them, substantially as described.

2. The spring-stops *c*, in combination with lugs or projections *d*, and openings *b*, substantially as and for the purpose set forth.

138,233.—*Car-Starter.*—THEODORE COOPER, Philadelphia, Pa. Application filed April 17, 1872.

To the car-axle is fitted a sleeve, on one end of which is a groove, in which rests one end of a lever, which throws the sleeve either in or out of connection with a friction-coupling. On the center of the sleeve is a pinion, which meshes into a rack that is secured to the draw-bar, which is divided into halves, the inner end of each half being attached to a strong spring. The friction-coupling is also attached to the spring and its movement governed by a pawl in combination with the coupling, by which arrangement, when the brake is applied, the power used to check the car is utilized in compressing the spring, and the same, reacting, assists in starting the car.

Claim.—The combination of the friction-clutch D, pinion E, rack I, spring N, lever O, pawl Q, and ratchet C, substantially in the manner described and shown.

138,234.—*Extension Step-Ladder.*—LEWIS B. COVERT, Detroit, Mich. Application filed October 28, 1872.

The latch engages with notches formed on the side of the extension, thus holding it in position. Hooks are provided at each step for attaching the cord anew as the extension is raised to different heights.

Claim.—1. In combination with the ladder A and extension E thereof, the plate B and latch *a*, substantially as described, and for the purposes set forth.

2. The cord K, in combination with the series of hooks *h h*, attached to the steps of the ladder A, and the extensible legs F G, substantially as described.

138,235.—*Washing-Machine.*—ELLIOT DICKERMAN, Middlefield, Conn. Application filed March 31, 1873.

The washing-machine is constructed in usual form, with a suspended rubber upon a vibrating frame, upon which the rubber is connected by pivots in open slots, that it may be removed at will. The rubber is constructed with bars, arranged in form of steps, and open for the free passage of water.

Claim.—1. The box A, frames A', links C, and vibrating squeezer B, combined and arranged as and for the purposes specified.

2. The operating-frame D D D^1 D^2, in combination with the vibrating squeezer B and suitable supporting and guiding means C, when the frame is connected by means of slots *d* and pins *e*, so as to be readily shipped and unshipped, as herein specified.

138,236.—*Saw-Tooth.*—JAMES E. EMERSON, Beaver Falls, Pa. Application filed January 24, 1873.

The cutting point of the tooth is formed of a triangular piece of steel, which, after being properly shaped, is made very hard, so that it may retain its cutting edge longer than the teeth commonly used.

Claim.—The removable saw-tooth C as a new article of manufacture.

138,237.—*Process for Refining Petroleum.*—ALONZO FARRAR, Brookline, Mass. Application filed February 26, 1873.

Mixes with oil, which has been treated with acid, an equal quantity of water and agitates them for a half hour; then draws off water, leaving the oil in the tank. Repeats this process till the acid is separated from the oil; heats the oil to a temperature of 300° Fahrenheit, and maintains at this temperature till the water is driven off.

Claim.—The process above described, of treating petroleum or crude coal-oil after mixture with sulphuric acid; or of treating the oil obtained from the spent acid used in refining petroleum or coal-oil.

138,238.—*Automatic Gate.*—LEANDER FILSON, Bushnell, Ill. Application filed September 28, 1872.

A gate running on tilting curved way overhead is operated by a connecting-rod, a crank-wheel, a cogged lever, and cords.

Claim.—In combination with a tilting gate running on rollers, as shown, the curved way G, the tilting bar F, connecting-rod and crank-wheel O N, and cogged lever M, arranged substantially as set forth.

138,239.—*Turbine-Wheel.*—DAVID B. FLINT, Orange, Mass., assignor to THE RODNEY HUNT MACHINE COMPANY, same place. Application filed March 6, 1873.

The step of this wheel is supported by a spider or cross having four or other suitable number of arms arranged at proper angles to each other. They project beyond the draft-tube of the wheel-case, and have fixed to them a short tube or centralizing ring, which slides within the draft-tube. Instead of being arranged within the draft-tube, the centralizing-tube may encompass it so as to slide up or down upon the outside of it, the object of the tube or ring being to maintain the spider duly centralized with respect to the draft-tube.

Claim.—The centralizing ring or tube E, the draft-tube D, the spider C, the screw-rods F, nuts H, and guide G, arranged and combined substantially as specified.

138,240.—*Rock and Ore Crusher.*—CHARLES FORSTER, Pittsburg, Pa. Application filed March 29, 1873.

Claim.—1. The jaws *a* and *d*, one of which is movable, such movable jaw having a grinding motion laterally across the face of the other jaw, as distinguished from an up-and-down grinding motion, substantially as and for the purposes described.

2. The jaws *a* and *d*, corrugated as shown—that is, with the full parts of the corrugations in one jaw opposite to the hollow parts of the corrugations in the other jaw—when one of such jaws is arranged for operation laterally across the face of the other, and at right angles, or nearly so, to the line of the corrugations, for the purpose of securing a crushing motion between the full parts of the corrugations, substantially as and for the purposes described.

3. The jaw *d*, chambered out at *i* and provided with a pivot or journal, *j*, in combination with the gearing *h*, substantially as and for the purposes described.

138,241.—*Machine for Distributing Type.*—MERRITT GALLY, Rochester, N. Y. Application filed February 21, 1873.

Types of varying thicknesses are clamped between two sliding jaws, to one of which an indicator is pivoted and vibrated by the other into proper position to engage the corresponding slot of an inclined bar, which operation stops the rear jaw over the proper letter-chute, and thus deposits the type therein.

Claim.—1. A set of types to be distributed by an automatic distributer, when the bodies of all the characters are made to differ from each other, in whole or in part, so that the difference in dimensions may be used to indicate to the distributing device the character of the letter or place for its delivery, substantially as set forth.

2. The combination, with an automatic distributer, of a multiplying-indicator, so that too fine adjustments may be avoided, substantially as set forth.

3. The combination, with an automatic type-distributer, of the clamps B C and a motor, substantially as set forth.

4. The compound clamp-slide, made up of parts E B and C D and friction device G, or equivalents, substantially as specified.

5. The combination, with an automatic type-distributer, of a type-carrier, a part of which shall stop at the place of delivery of the type while the other part proceeds in its movement, substantially as specified.

138,242.—*Car-Axle Box.*—STEPHEN F. GATES, Cambridge, Mass. Application filed August 3, 1872.

Claim.—1. The air-tight oil-fountain forming a part of the axle-box, as described, and arranged to regulate, automatically, the supply of oil to the axle through the agency of heat, the heat serving to force oil from the box by reason of the expansion of the oil, or of the air and oil in the box, substantially as set forth.

2. The glasses E E applied to the oil-fountain of a car-axle box, substantially as described, and for the purpose specified.

3. The air-tight oil-fountain D, the plug-screw K or its equivalent, and the regulating feed-valve H or its equivalent, in combination with the aperture L, bearing B, and shaft A.

4. The pipe N, in combination with an air-tight oil-reservoir in or upon the car or platform, and with the axle-box, substantially as shown and described.

138,243.—*Lubricator.*—JOHN GATES, Portland, Oregon. Application filed August 23, 1872.

Claim.—1. The described method of feeding oil, consisting in delivering the oil from the reservoir up through a body of water inclosed in a glass chamber, and discharging the same through the feed-cocks, substantially as described.

2. The combination of an oil-chamber with a water-chamber, the latter being located over the former, and adapted to receive oil from it, and deliver the same above the body of water inclosed in it, substantially as described.

3. The combination of the chambers A F, passages J K, and plug M with the induction-pipe I and feeding-cocks, substantially as described.

4. The drip-pan C provided with the filling-ping D, substantially as described.

138,244.—*Planing-Machine.*—ETMAN GOULD, Norwich, Conn. Application filed February 8, 1873.

The bands supporting the idle-wheels and gear-wheels on the ends of the feed-rollers are fitted to hubs on the ends of the journal-boxes, to obviate the wear which otherwise would ensue by a rapid motion of the feed-rollers. The bearing-steps of the vertical spindles are constructed for the reception of a lining of soft metal, and to leave a space for oil on the top and at the bottom aronnd the bearing-boss.

Claim.—1. The combination, with the hubs *d'* of box D and standards supporting it, of the journal of the upper feed-roll and the journals or studs *e g* of the straps or links *k m*, substantially as and for the purposes set forth.

2. The combination, with the chambered bearing-piece L of the planing and matching machine, of the supporting projection 4 and the bearing parts 5 and 6, substantially as and for the purposes set forth.

138,245.—*Calculating-Machine.*—GEORGE B GRANT, Cambridge, Mass. Application filed December 30, 1872.

A series of notched or laterally-toothed and numbered wheels, each comprising three decimal series and mounted on the same axis, are arranged to perform operations in addition and subtraction by means of engaging and disengaging pins, drivers, and carriers, operated by a curved shield having suitable slots and numbered spaces reversed in direction on opposite sides of the slots.

Claim.—1. The combination of two pins, *p* and *p'*, in the plate P, with the driver *d*, so that it shall be thrown onto the wheel A by the pin *p'* and off again by the pin *p*, substantially as set forth.

2. Providing the driver *d* with a pointed head, so that it will be thrown onto or off the wheel A, according as the right or left side of the point strikes the pin *p*, substantially as described.

3. The combination of bar E with pins *p*, on the wheels A, B, C, &c., substantially as and for the purpose specified.

4. The arm K, which is thrown into the path of the driver *d* by the carrying-stud *x*, substantially as described.

5. The connector *b*, so arranged as to throw the carrying apparatus belonging to any decimal place into action when the carrying apparatus belonging to the next decimal place below is in action and the value of that place is at the same time nine, substantially as hereinbefore set forth.

6. The combination of the catches *n* and *z*, or their equivalents, in the carrying apparatus, the catch *n* to hold it out of action till the next decimal place below reads nine, and the catch *z* till that place reads zero, if its carrying apparatus is not in action, substantially as set forth.

138,246.—*Dumping-Wagon.*—DAVID E. HAINES, Uniontown, D. C. Application filed February 25, 1873.

The driver by turning a crank causes the wagon to be dumped, and brings the wagon-box again into position by backing his horses, looking the tongue. In either operation the driver is not obliged to move from his seat.

Claim.—1. The combination of the pin *s* or its equivalent with the block *c*, cord or chains *d*, wheels *e* and *f*, and crank-rod for giving motion to the body of the wagon.

2. The combination of the arm *l* and stanchion-roller *n* for elevating the tail-board.

3. The combination of the bars *u* and *r* with spring *y*, knuckle *o*, and reach and movable tongue, as and for the purpose described.

4. The combination of the plate *r* with the plate or recessed front axle, as and for the purpose set forth.

138,247.—*Carriage-Spring.*—CHESTER F. HALL, Rockford, Ill. Application filed December 30, 1872.

The transverse springs are attached to the longitudinal springs by means of screw-bolts working in double conical holes in said springs.

Claim.—1. The spring A, in which the leaf *a'''* has bearings *b b*, in combination with leaf *a''*, which has the bent lips *b'*, in the manner and for the purpose substantially as described.

2. The spring A', having conical bolt-holes *c c*, in combination with the spring A, having screw bolt or pin *a'*, in the manner and for the purpose substantially as described.

138,248.—*Tuyere.*—GEORGE HARSCH, Chicago, Ill. Application filed October 11, 1872.

The blast is regulated by a valve supported inside the air-chamber by standards passing through the under part of the air-chamber into a frame, and raised and lowered by a lever. A valve opening downward allows cinders to escape, and is held in place by a latch.

Claim.—The combination of the chamber A having opening *a* above, opening below, and side opening, pipe B, frame A A^1 A^2 A^3, with valve C, lever D, bearing E, and valve F with latch *k*, all constructed and arranged as set forth.

138,249.—*Horse Hay-Fork.*—LEVI HAVERSTICK, Manor township, Lancaster county, Pa. Application filed March 14, 1873.

The handle and cross-head, attached in the usual way, have four tines which pass directly through the cross-head, then carved, and riveted to the handle.

Claim.—1. The combination of the tines 1, 2, 3, and 4, head B, and handle A, when said tines pass through the head and are riveted to the handle, substantially as and for the purpose described.

2. The combination of handle A, tines 1, 2, 3, and 4 passing through cross-head B, brace connections G G, clevis F, jointed lever E D, tripper *c*, and catch and cord connections, arranged and operated in the manner and for the purpose set forth.

138,250.—*Treatment of Sewage.*—FRITZ HILLÉ, Flora Villa, Brentford, England. Application filed August 6, 1872.

The sewage, after having been mixed with the disinfecting liquid, enters the first chamber, in which it is thoroughly mixed by a revolving agitator. From the mixing-chamber the sewage, &c., flows through a series of depositing-tanks, wherein the solid matters settle. The purified sewage escapes from the third settling-tank through self-acting floating-outlets, passing thence to the filters, composed of broken brick, stone, &c., and a layer of spent charcoal from sugar-refineries mixed with seaweed. Before the purified sewage reaches the filters it is treated with carbonic-acid gas, causing the excess of lime to be deposited.

Claim.—1. The treatment of sewage with lime, the chloride of zinc, and the chloride of magnesium, substantially as before set forth, and the subsequent separation of the liquid and solid constituents by deposition and filtration.

2. The treatment of sewage with lime, and, after the deposit of the precipitate, with carbonic acid, previous to filtration, to precipitate any excess of lime, substantially as before set forth.

3. The combination of the deposit-tank and the filter, by means of the self-acting floating outlet, so as to draw off the liquid at or near the surface thereof, substantially as before set forth.

4. The combination of the agitating-chamber with two sets of deposit-tanks and filters, so that one series may be cleansed and got ready for use without the necessity of stopping the flow of sewage, substantially as before set forth.

5. The manufacture of artificial manure by mixing together the chemical precipitate obtained by treating the sewage with the disinfecting materials and the spent filtering materials, and drying the product, substantially as before set forth.

138,251.—*Brick-Machine.*—JAMES HOTCHKISS and PHILIP N. WOLISTON, Springfield, Ohio. Application filed November 6, 1872.

Continuous webs of clay delivered vertically from between forming-rolls upon a counterweighted frame, which sinks with the weight; this web, then forced off horizontally upon a roller-carrying frame, being cut into bricks by wires stretched across its path onto the carrying-frame. Forming-rolls sanded by perforated cylinders placed above them.

Claim.—1. The combination and arrangement of the press-box A, dies D, and wire L, so as to form and deliver a section of the web of clay vertically or nearly vertically downward, for the purpose herein specified.

2. The counter-weighted frame or carriage E, for receiving the web of clay, arranged and operating substantially as and for the purpose herein specified.

3. The arrangement and combination of the vertically-moving

roller-frame or carriage E, receiving-board *g*, plunger N, roller carriage-way G, and the stationary wire-frame M, substantially as and for the purpose herein specified.

138,252.—*Bed-Bottom.*—MARCUS A. HUNT, Cincinnati, Ohio. Application filed April 7, 1873.

A spring-holder arranged in the mortise of a slat, the holder having lips or flanges that clasp against the slat.

Claim.—The holder D having lips *a a'*, in combination with, and arranged in the mortise of, a slat of a bed-bottom, substantially as described.

138,253.—*Inhaler.*—CLINTON D. HUNTER and ERASTUS S. WOODS, Marlborough, Mass. Application filed March 29, 1873.

A valve is placed in the exhaust-tube to prevent the water from being blown into the acid-receptacle, which is sunk in a deep recess in rubber stopper of the inhaler. The stopper is also provided with a deep groove, into which the inlet-tube may be forced when its outer end is disconnected from the acid-bottle. A rubber band buttons over the top of the cork to hold the acid-bottle securely in its place.

Claim.—1. The valve *d*, in combination with the exhaust-tube C, inlet-tube *b*, stopper B, and main receptacle A, operating substantially in the manner and for the purpose described.

2. The stopper B provided with a cavity or recess for the reception of the acid-vessel *c*, substantially as and for the purpose set forth.

3. The stopper B provided with a groove, *h*, for the reception of the upper portion *g* of the inlet-tube *b* when forced down, the inlet-tube being so constructed and arranged that it may close the exhaust-passage and prevent the leakage or escape of the medicated liquid from the main receptacle when tipped or inverted, substantially as described.

4. The band *i*, in combination with the acid-vessel embedded in the stopper B, and the inlet-tube *b*, substantially as and for the purpose set forth.

138,254.—*Manufacturing Pyroxyline Articles.*—JOHN W. HYATT, Albany, N. Y. Application filed October 23, 1872.

Place the coated article in a receiver and force in air or liquid under about twelve atmospheres pressure.

Claim.—In the manufacture of articles composed of compounds of pyroxyline or soluble cotton, or of articles coated therewith, the process of subjecting the articles, when first formed or coated, and before drying, to pressure in a vessel, by forcing therein air, alcohol, and water, or other suitable fluid which will absorb the solvent from the formed article, the pressure on the surface preventing the expansion thereof and the formation of air-cells without distorting the shape of the article, substantially as hereinbefore set forth.

138,255.—*Reflector.*—CHARLES F. JACOBSEN, New York, N. Y. Application filed March 29, 1873.

The reflector is made in sections, which are united by hinge joints and pins. If exterior burners are attached the gas-distributer is also made in sections, which are united by collars, one above and one below.

Claim.—1. A reflector, constructed as described, divided vertically through the middle into two sections, which are united by means of the pins *b* entering eyes *a*, as and for the purpose specified.

2. A reflecting-chandelier, in combination with a gas-distributer, when both are made in sections, substantially as and for the purpose described.

138,256.—*File.*—JAMES B. JOHNSON, San Francisco, Cal. Application filed October 4, 1872.

A three-cornered file, with the corners rounded and serrated the same as the flat surfaces.

Claim.—The improvement in the art of making three-cornered files, the same consisting in rounding the corners of the files, substantially as and for the purpose above described.

138,257.—*Machine for Turning Heel-Rands.*—JOSEPH B. JOHNSON and GEORGE W. MOULTON, Lynn, Mass. Application filed December 10, 1872.

A circular head is supported upon one end of the arbor, is provided with radial teeth upon its outer surface, and revolves in the rand chamber or passage, forcing the stock against an abutment, bending it into form and beveling its inner edge to the thickness required.

Claim.—1. The combination of the abutment A, provided with or being without the discharging-passage *h*, the rand-turner B, the case D, having the rand turning and spring chambers, as shown, the spring *f*, the screw G, the cross-head F, the arm *i*, and the crank H, all arranged and combined essentially in manner and to operate as and for the purpose specified.

2. The combination of the abutment A and the discharge-opening *h* thereof with the rand-turner B and the rand guide-chamber *d*, provided with a mouth, *e*, for reception of the rand, as set forth.

138,258.—*Sash-Holder.*—ELIJAH KNAPP, San Francisco, Cal. Application filed December 14, 1872.

A thin plate of spring metal is secured by screws in one edge to the front of the side rail of the sash. The free end of the plate works against the inside of the window-jamb, and creates enough friction to prevent the window from easily falling when raised, and also makes a tight joint and prevents rattling. The central portion of this thin plate is furnished with a perforation smaller than the head of a set-screw, which is screwed into the sash underneath. This set-screw bears against the plate directly under the hole, and may be operated through said hole from the outside, so as to regulate the pressure against the jamb.

Claim.—The thin plate A attached to the inner face of the sash, secured by screws or their equivalents at one end, and adjustable against the jamb by means of a screw placed beneath its central portion and operated through an opening of less size than the head of said screw, as described.

138,259.—*Corn-Planter.*—LESLIE LACEY, Bath, Ill. Application filed October 19, 1872.

A lever on each side is raised by pins on the spokes of the carriage-wheels, and thus, by a bell-crank lever, actuates the seed-cup slides, and on falling, by a rigid and laterally-adjusted marker, indicates where the seed has fallen.

Claim.—The combination of the dropping-levers F, the link *t*, crank *n*, and lever *m*, and rod *t'* with the oscillating valve L in the hopper H, as described.

138,260.—*Milling-Machine.*—BENJAMIN LAWRENCE, Lowell, Mass. Application filed March 3, 1873.

A vertical post supporting by a collar a rotatable sleeve, from which extend in opposite directions two arms, to which are attached, respectively, mechanism to support a wheel to be cut and plain work to be milled, the milling-tool being located above on a horizontal shaft, adjustable longitudinally and also vertically.

Claim.—1. The combination of the index-miller A and the plain milling-machine B with the stand C and tool *d* by means of the sleeve D, substantially as described.

2. The combination of the adjustable tool *d* and index milling machine A, constructed to swing away from the tool and its shaft, substantially as described.

3. The combination of the plain milling-machine B, rotating about the stand C, with the tool *d*, substantially as described.

138,261.—*Match-Safe.*—CLINTON H. LEGGETT, Elizabeth, N. J. Application filed February 12, 1873.

The cast boxes and sheet-metal back are united by a dovetail joint. An ear or projection from the back is bent down upon the top of the box to prevent disunion of the parts.

Claim.—1. The combination, with the cups B D, of the sheet-metal plate A provided with the clamping and holding parts *a a*, *b b'*, substantially in the manner described and shown in the drawing.

2. As a new and improved article of manufacture, a match-safe composed of the cast cups B D, united together by the parts A, *a a'*, *c c'*, and *b b'*, constructed substantially as described and specified.

138,262.—*Furniture-Polish.*—CALEB A. LIBBY, La Cygne, Kans. Application filed April 7, 1873.

Raw linseed-oil, turpentine, dragon's blood, resin, alum, iodide potassium, sulphuric acid, nitric acid.

Claim.—A composition formed of ingredients or substances compounded in the proportions and in the manner as herein specified, for the purposes set forth.

138,263.—*Wagon-Axle Lubricator.*—WILLIAM LOEWENSTEIN, Keokuk, Iowa. Application filed March 19, 1872.

A channel is formed longitudinally on the inner side of the box to conduct and distribute the oil.

Claim.—The box D with the channel G and the elevated part C, and having the pipe B opening into channel G from the outside of the hub for the introduction of lubricants, and with screw A, substantially as set forth.

138,264.—*Machine for Cutting Out Planchets of Sheet Metal.*—JOHN LOWE, Taunton, Mass., assignor to THE ALBERT FIELD TACK COMPANY, same place. Application filed March 11, 1873.

The forward feed of the strip is at right angles to the direction of the lateral feed, and to avoid waste of material, after the last blank of each row has been punched, the lateral feed moves the sheet one-half of its previous movement, when a forward movement takes place. This causes the first blank of the next row to be punched obliquely in the rear of the one punched previously, and so on throughout each row.

Claim.—The intermittingly-reciprocating slide H, so actuated that the last movement at each end of its traverse shall be one-half that of its other movements, in combination with the feed-roll *p* and its actuating mechanism, and the punch *d*, when the table I is so arranged that the forward feed of the strip to be punched takes place at right angles to the direction of its lateral feed, all operating substantially in the manner and for the purpose described.

138,265.—*Car-Axle Box.*—WILLIAM J. MANKER, Sedalia, Mo. Application filed September 26, 1872.

The bearings within the journal-box are formed with air-chambers and apertures in their sides which correspond with like openings in the sides of the journal-box. To the openings in the sides of the journal-box are fitted funnels, which serve to conduct air within the box and around the journal, the object being to prevent the journal from heating.

Claim.—1. In a car-axle box, a bearing-piece provided with an air chamber or chambers and communicating passages opening upon the journal, constructed substantially as described, for the purpose specified.

2. The combination of a bearing-piece, provided with chamber or chambers and communicating passages, with a casing or shell provided with funnels, or equivalents, for catching and conducting the external air into the chambers and passages, substantially as described.

138,266.—*Vessel for Containing Liquids Under Pressure.*—SAMUEL MARKS, San Francisco, Cal. Application filed November 26, 1872.

Claim.—The jar or vessel A having the emptying-faucet B, and with its oblong or oval mouth, in combination with the oblong or oval plug C, with its shoulder *d*, the bridge or cross-piece *f*, and set-screw *g*, substantially as and for the purpose set forth.

138,267.—*Ventilating Water-Closet Bowls.*—J. VICTOR MATHIVET, Cleveland, Ohio. Application filed March 7, 1873.

A water-closet bowl made in the usual form except that the top edge is made thicker and is provided with a groove for the purpose of inserting a strip of packing to make an air-tight joint between the said bowl and the seat-board which lies over it. There is an outlet-pipe, which leads to a flue or pipe attached to the wall of the room, for conducting off the effluvia from the bowl, and when the lid of the seat is raised the draft is inward through the seat, so that none of the foul air escapes into the room.

Claim.—In a water-closet bowl having a thickened upper edge, the combination of the groove B and packing and the outlet-pipe C, for the purposes respectively of forming an air-tight joint between the bowl and seat and for ventilating the bowl in such manner as to prevent the escape of odors into the apartment, substantially as described.

138,268.—*Nut-Lock.*—LEVI J. MILLER, Orrville, Ohio. Application filed March 11, 1873.

A right and left hand screw-thread is cut on the bolt, with a space between to receive a sliding slotted plate, which is provided with flanges and projections formed to fit into notches on the corners of the nuts.

Claim.—1. The lock-washer C with the oblong slot F, rear flanges *c c*, and front corner projection *e*, the several parts being arranged substantially as and for the purpose specified.

2. The combination of the bolt D with right and left handed threads *d* D' and flattened seat *h*, washer C with slot F, rear flanges *c c*, and corner projection *e*, main nut E, and lock-nut B, the several parts being arranged and operating substantially as and for the purpose specified.

3. The lock-nut B with rear notches *i*, in combination with the sliding washer C with projection *e*, substantially as and for the purpose specified.

138,269.—*Steam-Generator.*—JOHN H. MILLS, Boston, Mass. Application filed October 23, 1872.

The water surrounding the system of pipes containing the bisulphide of carbon is in a reservoir open to the atmosphere to prevent a temperature higher than that at the boiling-point from being attained. The exhaust vapor is condensed and re-used, and if a compound engine is employed it passes to the auxiliary cylinder through a pipe located in the water-reservoir, so as to be subjected to the same heat as that for vaporizing the material.

Claim.—1. In a system of generating steam from a sensitive fluid, as described, in which two differential cylinders are employed for purposes stated, the method, substantially as herein shown, of reheating the exhaust steam in transit from the primary to the auxiliary cylinder by passing the exhaust-pipe through the tank containing the water or other liquid heating medium, substantially in the manner set forth.

2. The combination of the generator E for containing the sensitive fluid, the surrounding water tank or jacket B, the condensing-pipe Q, and the primary and auxiliary cylinders G and T, said parts being arranged for joint operation, substantially as shown and described.

3. In combination with the sensitive-fluid steam-generator and the surrounding water tank or receptacle, the heating-chamber C, and the furnace communicating with said chamber, under the arrangement and for operation as shown and described.

138,270.—*Log-Turner.*—JAMES C. MOORE, Ypsilanti, Mich. Application filed February 3, 1873.

The log is placed in slings which pass over pulleys, and is raised by a system of levers, to which is attached a chain connected with a windlass.

Claim.—1. The combination, with the slings G, of the levers B', ways D, carriages or blocks E, and sheaves F, when arranged to operate substantially in the manner and for the purposes specified.

2. In a saw-mill, the arrangement of the chains or ropes *d*, sheaves A, drum *m*, pulley *c*, and bed *e*, in combination with the devices hereinbefore named for elevating the log, substantially as and for the purposes shown and described.

138,271.—*Store-Stool.*—ALEXANDER A. MURPHY, Montreal, Canada. Application filed December 2, 1872.

A seat attached to or connected with a screw fitted to and working in an enlarged end of the standard or support, which has on its lower end a pivot fitted to a socket with a shoulder for its support, the socket being constructed with an enlarged foot for securing it to the floor.

Claim.—The standard *a* with the reversible socket *e*, in combination with the nut *b*, screw *c*, and seat *d*, substantially as and for the purpose hereinbefore set forth and described.

138,272.—*Key-Fastener.*—WILLIAM NERACHER, Cleveland, Ohio. Application filed April 2, 1873.

The key is prevented from being turned in the lock by means of a metallic plate, one end of which passes through the key-bow, and the other end is secured to the door by a button. This plate may be attached to the key, and serve also as a tag on which the number of the room or name of the owner may be marked.

Claim.—The plate or tag D, button-hole *e*, and button E, in combination with the key C and door, in the manner as and for the purpose specified.

138,273.—*Mitten.*—FARNAM L. OAKLEY, New York, N. Y. Application filed March 1, 1873.

Knitted mittens are widened so that the thumb portion projects from the mitten to suit the natural position of the thumb.

Claim.—As a new article of manufacture, a mitten having the hand portion D corresponding to the wrist in width, and the thumb portion formed by widening out the web altogether on one edge, or partly on one edge and partly on the other, as shown and described.

138,274.—*Lubricator.*—JOHANNES OSENBRÜCK, Hemelingen, Germany. Application filed April 2, 1873.

The circular oil-cup forming part of the journal-box is secured upon the shaft, and both are connected by passages and tubes bent with their interior openings opposite the direction of revolution of the cup. When the cup is brought into swift rotation the surplus lubricating material will pass from the journal into the cup, be spread over the greatest interior surface, taken up by the small bent tubes, and conveyed back into the grease-box.

Claim.—1. The arrangement of circular cups on the rotating shaft or on a loose pulley, in combination with a stationary pipe or pipes, whereby oil collected in said cup, and thrown by the centrifugal force against the inner periphery of said rotating cup, is caught by said stationary pipe or pipes and conveyed through the same either into the grease-cup or into the bearing, substantially as and for the purpose set forth.

2. The centrifugal cup D, attached to the revolving shaft A, in combination with pipe J, attached to the bearing B, and connected through suitable holes with the grease-cup C, operating in the manner and for the purpose substantially as described.

3. The recesses *d d*, channel-way *m*, and pipe *b* in the shaft-bearing, in combination with a centrifugal cup, D, fast to the revolving shaft, and pipe J fast to the upper part of the shaft-bearing connected with the lubricating-cup C, substantially in the manner and for the purpose hereinbefore set forth and specified.

4. The cavities H in the loose pulley, closed by suitable cups D, in combination with pipes *v* and *w*, attached to the shaft and connected through suitable holes or channel-ways with a groove, *s*, or with the internal bearing of said pulley, and operating in the manner and for the purpose substantially as hereinbefore set forth and described.

138,275.—*Animal-Trap.*—DEMUS J. OWEN, Springville, Pa. Application filed March 10, 1873.

A self-setter, the victim in endeavoring to escape setting the trap for the next one.

Claim.—1. The arrangement of the drops or gates B B' and the wires *c* and *d*, substantially as shown and described in the box A, and for the purposes herein set forth.

2. In combination with the above, the sliding box C, for the purposes herein set forth.

138,276.—*Apparatus for Separating Metals.*—SAMUEL J. PEET, Boston, Mass., assignor to THE PEET VALVE COMPANY, same place. Application filed June 14, 1872.

The reciprocating trough causes the magnets to traverse the mass of filings, so that the iron is not swept forward and out of the trough by the revolution of the drum.

Claim.—The combination of a reciprocating reservoir, D, the drum B provided with a series of magnets, *a a*, &c., and the rotary brush C, substantially in manner and for the purpose hereinbefore specified.

138,277.—*Screw and Nut.*—SAMUEL J. PEET, Boston, Mass., assignor to THE PEET VALVE COMPANY, same place. Application filed October 17, 1872.

To diminish friction, but without affecting strength or essential bearing, the periphery and one side of the thread of either bolt or nut is cut away to prevent impingement of the threads where impingement is not required.

Claim.—A bolt and nut, the thread of one or both of which is reduced on its periphery and on one of its lateral surfaces, in the manner and for the purposes set forth.

138,278.—*Screw-Rod.*—SAMUEL J. PEET, Boston, Mass., assignor to THE PEET VALVE COMPANY, same place. Application filed January 22, 1873.

The rod or valve-stem has two screw-threads of different pitch to operate in nuts of corresponding pitch, the object being to obtain variable speed.

Claim.—The combination of the rod B, provided with two male screws or series of threads, *c d*, of unequal pitch, as described, with the part A having corresponding female screws or nuts *f g*, the whole being arranged so as to operate together in manner and for the purpose set forth.

138,279.—*Revolving Book-Case.*—LUTHER B. PEET, Tecumseh, Mich. Application filed January 21, 1873.

A series of book-cases, a pair of drawers, and four book-rests, all revolving on a central spindle mounted on a movable platform. The doors of the book-cases have studs projecting from the top and bottom edges. These studs slide in grooves made in the top and bottom of the cases, the grooves extending from the middle of the doorway to the right-hand corner and half-way around the right side of the closet.

Claim.—1. The construction and arrangement of the platform A, spindle B, case C, drawers C' C', closet D, book-supporting frames E E', and one or more book-cases, F G, all revolving on said spindle, substantially as shown and set forth.

2. In combination with the case, constructed as described, the doors D' provided with studs *f f* sliding in the grooves *e e*, substantially as shown and described.

138,280.—*Lever Cider-Press.*—HENRY PETERS, Penn township, Lancaster county, Pa. Application filed March 17, 1873.

A pair of bolts locking alternately into slotted bars, one of which is affixed to the bed of the press and the other to a lever, both passing through slots in the head of the pressing-beam held between guide-posts, and having its fulcrum-pin in a post on the base-bed, which supports the material to be pressed.

Claim.—The perforated vertical bars L M, when severally connected with the base-block B and lever P, in combination with bolts R, pivoted springs *s*, press-beam D, hinged bar N, all arranged and operating substantially in the manner and for the purpose specified.

138,281.—*Apparatus for Packing Snuff.*—AUGUSTUS H. FLOCK, Philadelphia, Pa. Application filed March 25, 1873.

The material is gaged in measuring-tube by a piston, made adjustable by means of a second piston or plate having an adjusting-screw and connection. The tube is pressed down into the material and receives the desired quantity, after which the measured mass is pushed out into a package.

Claim.—In combination with the measuring-tube A and adjustable piston B, the rods C C, plate D, removable head E, and adjusting device J H, substantially in the manner and for the purpose above set forth.

138,282.—*Medical Compound Called Milk of Magnesia.*—CHARLES H. PHILLIPS, New York, and LAWRENCE REID, Brooklyn, N. Y. Application filed March 15, 1873.

Claim.—The medical compound herein described, consisting of a hydrate of magnesia mixed with water, and termed a milk of magnesia, when prepared in the manner substantially as specified.

138,283.—*Automatic Gate.*—JOSEPH P. POXON, Mayfield, Cal., assignor to himself and JOHN MILLER, same place. Application filed September 2, 1872.

The gate-post extends beneath the surface of the road-way, and, by a system of levers, is turned so as to open the gate when the hand-levers are thrown outward. By the same movement the latch is worked by cords, bell-crank, and levers connected to the fixed arm at the bottom of the post.

Claim.—1. The gate B with its extended post *d* bearing in a timber below the surface of the road, and having the fixed arm *g*, in combination with the rods *j j j'*, centrally-pivoted rocking-lever *m*, and upright levers K K', all connected and arranged as and for the purpose above described.

2. In combination with the arm *g* and levers *j j'*, the short levers *i o*, cord *p*, and bell-crank *r*, substantially as and for the purpose above described.

138,284.—*Universal Joiners.*—JOSEPH H. RAYNARD, BENJAMIN W. HATCH, and WILLIAM P. HATCH, Boston, Mass. Application filed August 14, 1872.

By this machine wood-work of any shape may be executed without removing the stock from the chucks.

Claim.—1. The combination of the upper bed or platform B'', provided with curved bars or plates E'', curved rack-bar F', and curved rails E', traveling in curved ways D'' formed in the top of curved sides C'' of a frame, A'', formed with segmental grooves N'', and operated by cog-wheel G', shaft H'', gears I K', shaft O'', and wheel M', substantially as specified.

2. The combination of the circular upper frame T, formed with grooved projecting rim, and provided with slotted bar S, rack-bar X, and operated by cog-wheel W, gears Y N, shafts U V, and wheel Q'', substantially as specified.

3. The upper platform or bed B'' and frame A'', arranged as herein described, in combination with the upper circular frame T, arranged and operated substantially as specified.

4. The turn-table I formed with cog-rim K, and to hold and allow the forward and backward travel of the slotted bar S, and operated by a cog-wheel, L, shafts Z Q, gears O P, and wheel R so as to revolve on platform A, in combination with the circular upper frame T, arranged and operated substantially as specified.

5. The platform A, having knees or braces *y*, traveling up and down in ways *x*, and provided with bearings C D, screw-rods B, gears J J', shaft E, and wheel H for raising or lowering the platform A, in combination with the frame *a* and turn-table I, arranged and operating substantially as specified.

6. The combination of platform A, turn-table I, frame T, platform B'', frame A'', all arranged and operated substantially as and for the purposes specified.

7. The combination of the swinging arm S'', cutter-spindle V'', shaft H', platform A, turn-table I, frame T, upper platform B'', frame A'', and frame *a*, all arranged and operated substantially as specified.

8. The adjustable standard R' arranged with spindle V', disk X' having apertures *x''*, in which engages a pin, *y''*, connected with bent spring Y', in combination with the bed or platform B'' and adjustable standard Q''', all arranged and operated as and for the purpose specified.

138,285.—*Wash-Boiler.*—JOHN REINIG, Fond du Lac, Wis. Application filed January 29, 1873.

A wash-boiler constructed with a false bottom with cylinders passing through it having angular perforations, and with cross-partitions on which are suspended valves to regulate the flow of water.

Claim.—The false bottom B, having two holes, D D, covered with caps C C, tubes E E, frame F, valves G G, together with the tubes K K and the cross-bars M M, in combination with wash-boiler A, when arranged and used as and, for the purpose specified.

138,286.—*Horse Hay-Fork.*—THOMAS RHOADS, Ottawa, Ill. Application filed February 17, 1873.

A casting with grooves in its upper side to receive a portion of the handle and tines of a common hand hay-fork, and means for securing in place and for hoisting is used to convert a hand-fork into a horse-hay fork.

Claim.—The casting A with staples B B, staples D D, and bail E, as an attachment to a common hand, hay, or manure fork, so that the same may be used as a horse hay-fork, substantially as described.

138,287.—*Water-Closet.*—PHILIP C. ROWE, Boston, Mass. Application filed March 1, 1873.

A bellows is so arranged that when the stream of water is let on the bellows fills itself with the foul air. When the pan is again raised to its former position, and the water shut off, the bellows closes and forces the foul air into the soil-pipe.

Claim.—The combination and arrangement, with a water-closet, of a bellows or its equivalent, having pipes connecting with the excrement-chamber and soil-pipe, and operated by the pull or cock, as the case may be.

138,288.—*Stirrer for Malt-Kilns.*—EDWARD SCHMIDT, Pittsburg, Pa. Application filed September 28, 1872.

The shaft acts in combination with the rack-pinion and guide as a carrier for the stirring-wheel. The wheel, while revolving, travels alternately back and forward over the drying-floor. The V-shaped troughs on the end of the arms have a fixed and a swinging side, and they are so attached on the successive arms that every alternate swinging half will act as a scoop while the wheel moves in one direction, and, during the opposite motion, the other swinging halves act in like manner.

Claim.—1. The shaft *a* as a carrier for a stirring-wheel, in combination with rack-pinion and sliding guide at each end, substantially as set forth.

2. A V-shaped stirring-trough, consisting of one fixed slide, *c*, and a swinging side, *c'*, the latter having a limited swinging motion, substantially as set forth.

3. The relative arrangements of troughs *c c'*, with the fixed sides of each two contiguous troughs adjacent or opposite, whereby each alternate swinging half will act as a scoop as the wheel goes one way, and the remaining swinging halves will have a like action with the reverse motion of the wheel, substantially as described.

4. A stirring-wheel having a forward-and-back traversing motion along the floor of the kiln or drying-oven, and also a simultaneous rotary motion, and operative in stirring the grain or malt whichever way it moves, substantially as described, without reference to the form of stirrers employed thereon.

138,289.—*Beer-Cooler.*—FREDERICK SCHMITT, Milwaukee, Wis. Application filed March 24, 1873.

A floating pan, made of metal and strengthened by wires inserted around the body of the pan on the inside, is filled with ice and floated on top of the beer to be cooled.

Claim.—A beer-cooler constructed with body A with wires B round the inside to strengthen it, and cross-pieces C secured across the bottom, all in combination, substantially as described.

138,290.—*Stereotype-Plate Holder.*—FREDERICK SCHOLEFIELD, Chicago, Ill. Application filed January 11, 1873.

The plate is held between a stationary and a moving slide, the latter guided in ways in the block by means of a worm-gear and worm, the shaft of which is actuated by a wrench.

Claim.—The griping-slide B provided with the rack *c* and moved in the ways *a* by means of the worm-gear C and the worm *c* on the vertical shaft D, substantially as described.

138,291.—*Harness-Buckle.*—JAMES L. SELLECK, Baldwinsville, N. Y. Application filed January 16, 1873.

Improvement on patent No. 79,874. The improvement consists in casting the lugs which form the hinge open at the bottom, and also in casting lugs on the opposite end of the hinged plate, which act as guides and hold it in place by friction.

Claim.—The cover A, having lugs or projections *a a* thereon to form the hinge-joints, and side pieces a^1 a^1 to guide and hold the cover in place when closed, combined with the body B of the buckle, as and for the purposes above set forth.

138,292.—*Floating Light-Houses.*—JOHN B. STONER, New York, N. Y. Application filed March 27, 1872.

Combination with central buoy and circular frame of small buoys adapted to be turned for painting and repairs; also combination of circular frame bridges, central and circumferential buoys, and combination, with a buoy or floating light-house, of mooring-chains and weight, whereby the structure may rise and fall with the tide and swells while constant strain is kept on the mooring-chain.

Claim.—1. The small or outer buoys a^1 arranged to turn on axles or journals, in combination with an endless chain for turning them, substantially as described.

2. The combination of a central buoy, *a*, and circumferential buoys a^1 operating as breakwaters therefor with a bridged platform, constructed substantially as described.

3. The mooring-chains f^1 applied to the central buoy of the float *a*, and loaded so as to operate substantially as described.

138,293.—*Floating Light-Houses.*—JOHN B. STONER, New York, N. Y. Application filed March 22, 1872.

Combination of wheels and drums and weight with telegraph-cable, whereby a constant strain is kept on the cable for taking up the slack thereof at different stages of the tide; also arrangement of valve in connection with concentric tubes, whereby water may be admitted for ballast or excluded and pumped out, and the buoy keeled over for painting or repairs; also combination, with circumferential breakwater-buoy, of central elevated office, connected therewith by gimbal-joint, and having its balance-weight extending through a protecting-tube into the water.

Claim.—1. The wheel U^1 and wheel E', the latter having a weight suspended from it, in combination with suspenders U^2 U^3, and the telegraph-cable U, substantially as and for the purpose described.

2. The tubes *d e*, extending from the office below the water-line, and provided with a valve, *f*, and a pump-tube, *o*, substantially as described.

3. The elevated office and an external buoy, A, connected together by means of a gimbal-joint, and having combined with them a loaded tubular portion which extends down into the water and keeps the said office in an upright position, substantially as described.

4. The casing C in combination with the ballast D^2, substantially as and for the purpose described.

138,294.—*Machine for Loading Cartridges.*—THOMAS L. STURTEVANT, Framingham, Mass. Application filed February 15, 1873.

Claim.—1. The combination, with the tubular cartridge-case receiver, of the wad or bullet magazine arranged by the side of said receiver, and provided with a feed-aperture corresponding to a similar aperture in the receiver, and the reciprocating feed-plate playing transversely across the magazine and operating at each traverse to push a wad or bullet laterally from said magazine into the receiver, substantially as set forth.

2. The combination, with the cartridge-case receiver and the wad or bullet magazine, arranged substantially as described, of the rammer and reciprocating feeder connected with and operated by said rammer, substantially in the manner and for the purposes shown and set forth.

3. The combination with the supporting clamp or frame, provided with a forked foot or shelf, of the cartridge-case receiver, hinged to said clamp or frame, so that its lower end may be swung either directly over or out away from said shelf, as and for the purposes shown and set forth.

4. The tubular cartridge case receiver and wad or bullet magazine, arranged together substantially as specified, in combination with the supply tube or tubes for introducing powder or shot into the receiver, substantially as shown and set forth.

5. The plunger or rammer, provided at its lower end with a type or die, substantially as and for the purposes set forth.

138,295.—*Dredger.*—THOMAS SYMONDS, Portland, Me. Application filed March 24, 1873.

The windlass and the small wheels are on the same shaft at the joint of the arms, and the wheels are connected with the joint of the opposite arms by ropes or chains. By pulling on the rope it is unwound from the windlass and the ropes connecting the small wheels and opposite joints of the arms are wound on the wheels, thus bringing the arms of the toggles together and closing the scoop with great power.

Claim.—1. The combination of the pulley *k*, placed centrally, with windlass *a* wheels *m n*, shaft J, the ropes extending from the small wheels *m n* on the shaft *d* to the opposite joints of the toggles, and cord *h*, as herein set forth.

2. The shaft *d* having the windlass *a* and wheels *m n*, when said shaft is located at the joint or angle of the toggle-joint, as herein set forth.

138,296.—*Washing-Machine.*—JOHN TABER, South Wolfborough, N. H. Application filed April 1, 1873.

A washing-machine constructed with a corrugated roll, with its upper surface covered with a bed of small rolls secured by journals to an oscillating frame and held in their position in slots by rubber springs, to give tension, and has guides attached to the uprights to conduct the clothes when in use.

Claim.—The combination of the base A, standards B B with guides I I, fluted roller C, rocking frame G H, rollers *b b*, and springs *d d*, all substantially as and for the purposes herein set forth.

138,297.—*Saw-Set.*—JOHN G. TATTERSHALL, Delphi, Ind. Application filed March 22, 1873.

The set-screw, rest, and anvil, being on the same arm, remain stationary in relation to the saw while the tooth is set by the jaw of the other arm, which passes through slots in the gage and stationary arm.

Claim.—1. The saw-set, having stationary arm B provided with anvil I, bar E, set-screw *a*, and adjustable flat gage G, and the handle A provided with rigid jaw D, projection *b*, and set-screw *d*, all constructed and arranged as and for the purpose specified.

138,298.—*Stretching-Tool for Wire and Rope.*—REUBEN LINCOLN TAYLOR, Golden Prairie, Iowa. Application filed January 20, 1873.

A tool having a large-headed pin on its rear upper surface, a small and headed pin forward of this, and a large inclined notch farther forward. A turn of the wire or rope is made around the larger pin, and then around the smaller pin, and thence around the larger again, when further turnings continue to tighten the wire or cord which is drawn through the notch. Increased leverage is obtained by inserting this dovetailed tool into a handle socketed for the purpose.

Claim.—The plate A provided with studs C and D, in combination with the wrench G provided with a dovetail score, H, fitted to the inclined sides of the plate A, substantially as described.

138,299.—*Shirt-Stud.*—OSCAR S. THAYER, Attleborough, Mass. Application filed March 6, 1873.

The teeth upon the periphery of the cup prevent the button from rotating upon the shank when more than ordinary resistance is encountered.

Claim.—1. The teeth in the edge of the cup in shirt-studs and other similar articles, substantially as described, and for the purpose set forth.

2. As a new article of manufacture, a shirt-stud in which the screw is secured to the button by means of a toothed cup, substantially as and for the purpose set forth.

138,300.—*Threshold for Doors.*—OSCAR G. THOMAS, Taunton, Mass. Application filed January 7, 1873.

Claim.—The improved water-shed threshold or threshold-plate, provided with the rear and edge-grooves *a b b*, and the covered educts *c c*, arranged and constructed as described and represented.

138,301.—*Machine for Pulverizing Soil.*—AUGUSTUS C. TOWER, Mendota, Ill. Application filed December 12, 1872.

The side bars of the rectangular frame are provided with adjustable beams, into which are inserted cimeter-shaped teeth. These adjustable beams can be placed in line with each other, or either one adjusted to any desired angle to the line of draft. They also have an oscillating motion.

Claim.—1. The combination of the beams A A with the side beams B B, the beams A A being capable of adjustment to the line of the draft, and also to the unevenness of the ground, substantially as described.

2. The combination, in a pulverizing-machine, of knife-carrying beams capable of double adjustment, adjusting-rods, and a pulverizing-beam, substantially as described.

138,302.—*Paper.*—HEINRICH EDWARD WAGNER, Copitz-Near-Dresden, Germany, assignor to J. F. HUGO MATTULLATH, Pittsburg, Pa. Application filed December 26, 1872.

Paper, saturated in benzine, is coated with boiled linseed-oil, lead shavings, oxide of zinc, turpentine, gum copal, and gum sandarac.

Claim.—As a new article of manufacture, translucent paper having a surface suitable for receiving a record by means of ink or other coloring matter, and a body and face such that the record so made may be removed by ordinary washing without impairing the paper for receiving a new record, when prepared substantially in the manner described, and for the purpose set forth.

138,303.—*Lathe for Turning Hubs.*—JOSEPH Z. WAGNER and HENRY R. FRY, Wabash, Ind. Application filed October 7, 1872.

The rest G, in connection with the sliding rest B, incloses the mandrel upon which the hub is secured and tends to prevent vibration therein.

Claim.—1. The movable rests B B, provided with the jaws which receive and embrace the mandrel, for the purpose set forth.

2. The chisel-head, connected and used in combination with the eccentric rests G G, as and for the purpose set forth.

3. The combination of the pivoted chisel-head D, arm *e*, pivoted lever *f*, and cross-piece E, all as and for the purposes set forth.

4. The combination of the chisel-head with the rests B B and G G, in such manner that the rests close upon the mandrel when the chisel begins to cut and hold said mandrel securely in position, substantially as and for the purposes herein set forth.

138,304.—*Fire-Escape Ladder.*—CHARLES H. WHITE, White's Station, Mich. Application filed January 21, 1873.

The ladder consists of links connected by rule-joints and wound upon a drum. The edges are formed into toothed racks meshing into spur-gearing, by means of which the ladder can be forced up an inclined guide to a desired height.

Claim.—The construction and arrangement, with relation to the frame A mounted on wheels, of the drum C of the chain-ladder D, having rule-joints formed by passing the bolts E through the webs *d*, the racks *e*, hinged guide-frame F F', the extension-braces G G', guide-rollers H H', shafts *k k'*, chain-wheel I, endless chains J, pinions K L, spur-wheels M, and counter-shaft *l*, substantially in the manner and for the purpose set forth.

138,305.—*Lathe-Dog.*—CHARLES L. WICKHAM, Utica, N. Y. Application filed August 3, 1872.

The plate, which is bolted to the face-plate of a lathe, is bent outward and flanged. From one side of this projection an arm or jaw extends downward. This jaw is slotted to receive a notched bar, which is caused to engage with a tooth in said slot by a thumb-screw passing through the plate and bearing on the bar. Said bar is in one piece with and at right angles to the other jaw, which slides on the flange, and is the means by which said jaw is adjusted.

Claim.—The improved lathe-dog, consisting of the jaw C, in one piece with the part A, and having a toothed mortise, as described, and the jaw E and the toothed bar D, also in one piece, all as and for the purpose set forth.

138,306.—*Folding-Guide for Sewing-Machines.*—STEPHEN W. WOOD, Cornwall, N. Y. Application filed April 9, 1873.

The opening through the edge-turning guide is so formed as to turn one or both edges at about a right angle to the main portion of the strip of material passing through it, and these edges so turned by coming against the inclined sides of the edge-laying guide-aperture are folded completely down, and the strip is then folded centrally between the trough-like throat and a stud which projects from the back of the plate or edge-guide into such throat.

Claim.—1. The combination of the edge-turning guide-throat B, or its equivalent, with the plate having the edge-laying guide-aperture C, as and for the purpose set forth.

2. The combination of the edge-turning guide-throat B, or its equivalent, and the plate provided with the guide-aperture, with the folding guide or throat D, the combination operating substantially as described.

138,307.—*Ore-Washer.*—THOMAS WREN, Hamilton, Nev. Application filed February 24, 1873.

Claim.—In an apparatus for washing ore by a counter current of water, the combination and arrangement of a short neck, C, containing the glasses *d*, and connecting the hopper B and box A with the pipe *f* so arranged as to give a directly vertical stream of water, as described.

138,308.—*Railroad Cattle-Guard.*—ROBERT M. YOUKS, Schoolcraft, Mich. Application filed January 21, 1873.

The weight of an animal upon the counterbalanced platform raises the picketed gate and arrests the animal's passage down the track.

Claim.—The platform C hinged to the ties, the apron D, picket-shaft E, pickets G, disks F F, each having a cam, *a*, the bearers I I, posts J J, and fulcrum-posts K or L, or both, and the weighted levers L, substantially as and for the purposes herein set forth.

138,309.—*Table-Leaf Support.*—EVERETT L. ABBOTT and SAMUEL T. GIBSON, South Bend, Ind. Application filed April 5, 1873.

A bent rod, with spiral ribs, operates in spiral loops attached to the table-leaf. Slotted plates are attached to the leaf and frame, one of them being serrated for receiving and holding the end of the bent rod.

Claim.—1. In a table-leaf support, a supporting-arm rendered capable of an automatic falling and forward movement, substantially as specified.

2. A supporting-arm provided with one or more spiral ribs, in combination with one or more spiral loops, substantially as and for the purposes specified.

3. The combination and arrangement of the arm C, provided with the spiral ribs *a a*, the loops *a' a'*, and the inclined serrated plate *e*, substantially as and for the purposes specified.

4. In a table-leaf support, the slotted plates D and D', either or both, substantially as and for the purposes specified.

138,310.—*Lumber-Measure.*—FRANK S. BALDWIN, St. Louis, Mo. Application filed November 16, 1872.

The spring-reel of a tape-measure is so arranged in relation to a disk carrying a cone of spur-wheels *as*, by means of an adjusting device, to be thrown into engagement with either one of several sets of registering-gears, and thus indicate the aggregate measure of different lengths of lumber.

Claim.—1. Two or more trains of a registering-instrument in one machine, with gears for connecting them with the tape-measure reel, arranged to shift the connection from one recording-train to the other, substantially in the manner described.

2. The combination of the differential cone H, pinion P, shaft Q, tubes R and U, radial plate *c*, and pinion O, substantially as specified.

3. The combination, with the disk *n* and recording-trains I, of the stop-lever *p* and the tappet *q* on the disk S, substantially as specified.

4. The combination of the disk V with graduated slots, as described, with the shifting devices for the pinion P, and a stop-pin, K, substantially as specified.

138,311.—*Car-Replacer.*—JOHN T. BAXTER, Finksburg, assignor of one-half his right to WILLIAM A. MCKELLIP, Westminster, Md. Application filed October 29, 1872.

A pivot working in a slot connects the hook to the supplementary rail to obtain adjustment at any convenient angle for replacing the unshipped car. The spike is also made adjustable, so as to shun spike-heads.

Claim.—1. The combination herein described of a swivel hook, D, with the supplementary rails A and B of a railroad-car replacer, for the purposes set forth.

2. The combination of an adjustable swivel-hook, D, with the supplementary rails A and B, for the purposes set forth.

3. The combination of an adjustable spike, *c*, with the supplementary rails A and B and hook D, for the purpose set forth.

138,312.—*Water-Elevator.*—THOMAS BELL, Bellport, N. Y. Application filed January 25, 1873.

The blades of the paddles are provided with buckets for receiving and holding the water, the buckets having a valve in one end and an adjustable head at the other to regulate the quantity of water lifted to the varying force of current.

Claim.—1. A box-bucket, G, having a valve in one end and an adjustable head, H, at the other, as described, so as to graduate the quantity of water lifted to the varying force of the tide or current.

2. The arrangement of water-carrying buckets G on the propelling paddles D of a wheel, as and for the purpose set forth.

138,313.—*Compound or Liniment.*—JOSEPH BENDA, Yatton, Iowa. Application filed April 5, 1873.

Alcohol, oil of sassafras, oil of hemlock, oil of origanum, oil of cedar, spirits of turpentine, tincture of Cayenne pepper, tincture of catechu, tincture of opium, tincture of myrrh, guaiac, gum camphor, chloroform, and wintergreen.

Claim.—The liniment consisting of a mixture of ninety-eight per cent. alcohol with two per cent. of the vegetable oils and extracts, in the proportions given, substantially as set forth and specified.

138,314.—*Doublet Stone.*—SIMON BRUHL, New York, N. Y. Application filed January 25, 1873.

Claim.—As an improved article of manufacture, a doublet stone, consisting of a base of artificial or inferior material, provided with one or more steps of facets above the girdle *a b*, and the cap piece or table of genuine precious stone, said parts being combined and arranged substantially as described and shown, for the purpose set forth.

138,315.—*Bag-Holder Weighing-Scale.*—HENRY T. BUDGE and NELSON W. RUSSELL, Cedar Falls, Iowa. Application filed January 9, 1873.

A scale-beam with forked or branching arms carrying knife-edge bearings is supported in an open frame, and to each extremity of the straggling scale-beams is attached a horizontally curved and grooved arm, with a lever-clamp for holding open a bag while being filled and weighed.

Claim.—1. The clamp G, composed of the perforated casting ears or flanges *e e*, lever *f*, and segment or disk *h*, all constructed substantially as and for the purpose specified.

2. The curved gutter-shaped holders *k*, in combination with the clamp G, constructed as set forth, the bag H, and the ring, substantially as and for the purpose herein specified.

138,316.—*Electro-Magnetic Induction-Coil.*—JOSÉ S. CAMACHO, Havana, Cuba. Application filed October 26, 1872.

The armature of the primary magnet, provided with an insulated cross-arm, is arranged to operate double-spring contact-levers reciprocally reversing so as to alternately reverse the induced current in the secondary coil, while the starting point of the current will be in the same direction, giving continuity of effect.

Claim.—1. The armature-lever *r*, arranged in combination with the spring-plates *m m'* and plates H, I, T, and E, to operate substantially as herein shown and described.

2. The plates H and E, arranged, respectively, over the plate *m'* and under *m*, and connected, metallically, with the screw K, as specified.

3. The plates I and T, arranged, respectively, over the plate *m* and under *m'*, and connected, metallically, with the screw J, as set forth.

4. The coils A A, connecting their wires with the screws F F', and plates *m m'*, as and for the purpose set forth.

5. The coils B B and A A, arranged in an apparatus in conjunction with the lever *r*, as set forth.

138,317.—*Coiled-Wire Brush.*—JOHN B. CHRISTOFFEL, Williamsburg, N. Y. Application filed February 15, 1873.

Two or more rods provided with a coil of wire are twisted together, either with or without two or more other rods destitute of this coil, thus forming a coiled brush with uncut edges.

Claim.—An improved coiled-wire brush, formed by the combination of one or more coiled wires, B, with two or more twisted wires, A, substantially as herein shown and described.

138,318.—*Dental Engine.*—CHARLES M. CURTIS, Philadelphia, Pa. Application filed February 14, 1873.

The treadle which communicates motion to a flexible power-conveyer passes through the standard so that the pitman is upon the side away from the operator's knee. A friction-wheel is pressed down by a spring against the periphery of the treadle-wheel. The shaft is coupled together by universal joints, which pass through sleeves. The sleeves are pivoted together by projecting arms, and one set of the arms or branches extends below the pivot-arm and is secured to springs, which tend to throw the two shafts into a line with each other. A rigid bracket holds the end of the flexible shaft so that it turns upon itself at nearly a right angle, and a flat steel spring holds the jointed portions of the power-conveyer in a horizontal position. The tool is released by forcing down a spring through an opening in the socket.

Claim.—1. The arrangement of the treadle-plate and pitman on opposite sides of the standard, said pitman and plate being connected by an arm of the latter intersecting the standard, substantially as described.

2. The combination of the wheel H, bearing B, shaft K, and spring I, substantially as set forth.

3. The combination of the shaft K, slotted sleeve-coupling *k*, and pin *k'*, as shown and described.

4. The combination of the coupling M N with the staff L or the extensions thereof, the branches being attached to said staff L or to a collar or sleeve by suitable springs P P, as set forth.

5. In combination with the shaft K, the curved arm S, bent spring U, and short shaft T, as set forth.

6. In combination with the rotating shaft of the hand-piece of a dental burring-engine, the sleeve e^2 and burr or tool *b*, lever *g*, pin *g'*, and spring *e*, said sleeve being provided with an opening, e^3, for obtaining access to the spring *e*, and the burr or tool having one or more bevels at its shank end, as specified.

138,319.—*Washing-Machine.*—HERMAN DEXTER, Chicago, Ill. Application filed September 6, 1872.

A cylinder with a corrugated inner surface. The staves or strips are tongued and grooved together. The heads of the cylinder are adjustably connected together by rods passing along outside of the cylinder, and held by nuts and screws. The door is made steam-tight by packing and a locking device. The cylinder rotates on journals having their bearings on friction-rollers arranged with cases secured to and supported by side standard.

Claim.—1. The body A, composed of the tongued-and-grooved strips B B and heads *a a* and their projecting rims, united by the bolts *b' b'*, as described, in combination with the interior corrugated lining or pieces *c c*, substantially as herein shown and set forth.

2. The door X and its elastic packing, in combination with the cylinder A, pivoted screw-rod *l*, nut *d*, and slotted plate L, as herein shown and set forth.

3. The cylindrical body A, made as described, and provided with the heads *a a* and interior corrugated surface *c c*, in combination with the journals R R, incased friction-rollers P P, and standards G G, all constructed and arranged substantially as described, for the purpose specified.

138,320.—*Cradle.*—WILLIAM T. DORRMUS, New York, N. Y. Application filed March 6, 1873.

A cradle suspended from the lower end of the legs by cranks passing through a cross-piece resting upon blocks of wood and rubber, with openings formed to give side motion, and held in position by staples and hooks connected to a supporting bracket or brace, on which it rests.

Claim.—The flexible supporting-columns F, in combination with the cranks C and cradle A B, substantially as herein described.

138,321.—*Folding-Seat for Street-Railway Cars.*—KIERGAN EGAN, New York, N. Y. Application filed March 22, 1873.

The bar to which the seat is attached is hinged to the supporting-rod, the latter being adapted to support the seat at different heights.

Claim.—The plate A, hinged bar B, sliding seat C, socket D and its lug and stops, tube E and its jaws, stops, and slot, and the rod F with its knob, constructed and arranged in connection with each other, substantially as herein shown and described.

138,322.—*Scrubber.*—ISRAEL J. EMORY, Jr., Webster, Ohio. Application filed October 26, 1872.

To the head or block of the scrubber plates of elastic rubber are fastened by metallic strips and tacks. These rubber plates extend below the block, and are cut in a vertical direction to form narrow strips. A wire is fastened to the block to form a loop for the reception of a mop-rag.

Claim.—The rubber plates C, block A, wire loop *d*, and handle B, combined, constructed, and arranged substantially as and for the purpose specified.

138,323.—*Mold for Glass Bottles.*—CHARLES D. FOX, Philadelphia, Pa. Application filed January 14, 1873.

Makes bottle without any seam or fin.

Claim.—1. A mold for glass bottles, having the cylinder, shoulder, and neck, cast or formed in one seamless piece, as shown, and having the hinged bottom C opening downwardly to allow the bottle to be taken from the bottom of the mold, substantially as specified.

2. A mold for glass bottles having the cylinder, shoulder, and neck-receiver cast or formed in one seamless piece, substantially as and for the purpose specified.

3. The hinged bottom C, opening downwardly, substantially as shown and described.

4. In combination with the bottom C, the lever D, as and for the purpose described.

138,324.—*Binding for Sewing-Machine Covers.*—EVELYN F. FRENCH, New York, N. Y. Application filed January 18, 1873.

A sewing-machine cover constructed in ordinary form, with a molding around its lower edge formed of veneers, by which its corners are firmly secured.

Claim.—A continuous band, B, made of narrow strips of veneering glued together and molded into shape, combined with the round-cornered cover A, as and for the purpose described.

138,325.—*Balanced Slide-Valve.*—ABRAHAM O. FRICK, Waynesborough, Pa. Application filed February 21, 1873.

A flexible diaphragm, corrugated at its outer edge, is connected by rings with flanges and bears against the back of the slide-valve. The upper ring, bearing against the steam-chest cover, is provided with suitable arms, through the center of which passes a regulating-screw, the lower end of which bears on the springs, by which the valve is held to its seat.

Claim.—1. The improved valve formed of the flexible corrugated ring H L, the inner ring K, cylinders B and D, and the outer flanged ring G, combined as shown and described.

2. The combination of the screw P and its jam-nut, the curved spring Q, arms N, and nut M, all arranged within the valve-cylinders A and B, and connected therewith, as shown and described.

138,326.—*Dress-Facing.*—WILLIAM H. GALLUP, Troy, N. Y. Application filed January 25, 1873.

A facing to protect the bottoms of dresses.

Claim.—As a new article of manufacture, a skirt-protecting facing, consisting of the plain band A of stiffened fabric, and the fluted strip B of like material attached thereto, substantially as and for the purpose described.

138,327.—*Feather-Renovator.*—WILLIAM S. GROFF, Mahanoy City, Pa. Application filed March 15, 1873.

Through one set of pipes steam is admitted into the cylinder, and through another it is admitted into chambers which do not open into the cylinder, but which, being thus heated, dry its contents after they have been renovated. The detachable beaters are used when feathers and hair are to be treated, and the detachable bars when carpets and the like are to be renovated.

Claim.—1. The cylinder A with distributing-pipes H I, drying-pipes F, connections E G, hollow journal C, escape-pipes K and X, and the beater-shaft L, substantially as specified.

2. The said beater-shaft having the beaters detachably connected, the disks Q, and the detachable bars R, substantially as specified.

138,328.—*Shave for Boots and Shoes.*—DEXTER HARRINGTON, Southbridge, Mass. Application filed March 31, 1873.

The spur-pieces are rigidly attached at their outer ends to the end of the frame or handle, while their inner ends press against the tangs of the cutter, their pressure rendered positive by means of screws.

Claim.—1. The combination, with the jaw-pieces C D, arm or rib pieces *c d c' d'*, and spur-pieces E E', of the adjusting screws G G' and H H' and cutter or shave B, substantially as and for the purposes set forth.

2. The combination, with the jaw-piece D, of the spur-pieces E E' and holding-screws G G', substantially as and for the purposes set forth.

138,329.—*Wheel-Plow.*—FRED HASBROOK, Stokes' Mound, Mo. Application filed August 13, 1872.

A guide-rod attached to the plow, sliding in a box on the sulky to cause the plow to rise vertically instead of tilting it and having a movable stop to regulate the depth, in combination with a hand lever and chain.

Claim.—The combination of the bar or rod A, box C, block G, chain F, and lever E, substantially as and for the purpose specified.

138,330.—*Washing-Machine.*—DANIEL W. HELFRICH, Corry, Pa. Application filed April 5, 1873.

A washing-machine constructed with a square receptacle and hinged cover, with the suspended upright shaft passing through it and connected with the cross-timbers or frame holding the beaters extending downward from it; and on its top is attached a crank, from which a pitman or connecting-rod, extending to the crank or arm attached to the driving-shaft, and gears by which motion is imparted by an ordinary crank. The pitman-crank attached to gear-shaft is of less length than the one on the main shaft, by which a reciprocating or oscillating motion is given to the beaters.

Claim.—The shaft D, cross-bars E, arms F, crank G, connecting-rod H, crank I, brackets K, gear-wheels L M, and crank O, constructed and arranged to operate in connection with the cover C of the box A B, substantially as herein shown and described.

138,331.—*Ironing-Board.*—RICHARD N. HERRING, Chew's Landing, N. J. Application filed April 1, 1873.

An ironing-board constructed with a brace connected at its upper end by a bracket and pivot, and supported by legs folding within it, one of which is attached to the upper end of the brace turning down, and one at its lower end turning up, both sustained by a projecting bracket connected with the brace, and may be closely folded when not in use.

Claim.—1. The hinged or pivoted frame B, folding supports F F', adapted, respectively, to be lowered and raised, and skirt or ironing board A, combined substantially as and for the purpose specified.

2. The plates G G', in combination with the folding supports F F' and frame B, substantially as described.

138,332.—*Corn-Crib.*—JOSEPH M. HUGHES and ANDREW J. MAPES, Independence, Mo. Application filed February 21, 1873.

Corn flows into feeding-troughs through an opening adjusted by bars.

Claim.—1. The adjustable feed-bars E E, in combination with a corn-crib, as and for the purposes described.

2. The troughs D, (one or more,) in combination with a corn-crib and adjustable feed-bars, substantially as shown and described.

138,333.—*Carpet-Stretcher.*—PETER KELLY, New York, N. Y. Application filed April 12, 1873.

The device is constructed with a pair of jaws with arms extending to form pinchers. To the ends of the arms is pivoted connecting levers or links, one in form of U, to which the handle is pivoted at one end, and its other end to an S-shaped bar or link, which, when working in concert by the handle attached to an upright lever, the carpet is firmly held, and by aid of the upright lever extended.

Claim.—The jaw-levers C and D, in combination with the intermediate links E F and handle-lever G, pivoted and connected, substantially as and for the purpose described.

138,334.—*Rotary Steam-Engine.*—JOHN LUCAS, Hastings, Minn. Application filed February 21, 1873.

The outer shell is provided at its upper side with a cam, in the center of which is pivoted a reversible and self-adjusting valve. The sliding pistons in the revolving inner cylinder are made in two parts, with right and left hand screws between them to adjust them as they wear.

Claim.—The combination and arrangement in a rotary engine of the case A, cam B, pistons F, induction-valves C C, piston-wheel G, reversible self-adjusting valve J, and port K, substantially as shown and described.

138,335.—*Medical Compound for Treating Rheumatism, &c.*—GIDEON LUCY, Mobile, Ala. Application filed April 5, 1873.

Tincture or extract of the root of the lint plant and diluted alcohol.

Claim.—A medicine of which the lint plant (or extract thereof) forms a component part, substantially as described.

138,336.—*Hinge.*—PHILIP P. LYNCH, Newark, N. J. Application filed January 21, 1873.

A hinge for book-clasps and the like articles, constructed to obviate the necessity of soldering, is formed by bending up the per-

forated ends of a narrow metallic strip and passing both the ends through slots or holes in a round face-plate, thus forming lugs or ears upon the same; these lugs engage the opposite part of the hasp or hinge, and are secured to it by a pin in the usual way, thus completing the hinge without riveting or soldering.

Claim.—The metal strip *s*, having its ends perforated and turned up at right angles forming a clip, both ends of which are passed through holes or slots *i i* in the plate *e*, thus forming lugs or ears (without riveting or soldering) on the face-plate of the hinge, said lugs engaging the opposite part of the hasp or hinge, and being secured to it by a rivet or pin in the ordinary way, all as described and shown, for the purpose set forth.

138,337.—*Elevator.*—MATTHEW MAGEEAN and GEORGE W. MARKS, Chicago, Ill. Application filed March 24, 1873.

The elevator-platform, when nearly at the top of the main frame, engages by the rack and pinion, and disengages when the lever is raised. Also, the guide-ways made in sections and connected by means of ferrule and pins.

Claim.—1. The combination, in an elevator, of a rack and pinion, ratchet and pawl, and lever, arranged substantially as described.

2. An elevated guide-way made in sections, having one end provided with the ferrule J and with one or more pins, K K, and the other end constructed to receive a ferrule, J, and one or more pins, K K, substantially as shown and described.

138,338.—*Pruning-Shears.*—MICAJAH C. MALONE, Palmyra, Ill. Application filed April 5, 1873.

The short shank of one blade of the shears is secured by a jointed link to a metallic plate, with lugs resting upon the top of the usual long wooden handle. The straight shank of the other blade passes through guides along down the side of the handle. The handle has a connection and sleeve that allows it to be readily taken apart in sections and still afford the needed strength.

Claim.—1. The plate D, provided with lugs *d'*, the sliding rod E, having a head, *e'*, upon its lower end and a hook, F, upon its upper end, the pivoted blade G, and the pivoted bar or bars H, constructed and arranged in connection with each other and a handle, A, substantially as herein shown and described.

2. The combination of the spring-hooks B *b'* and the sliding band or ferrule C with the adjacent ends of the sections of the handle A, substantially as herein shown and described, and for the purpose set forth.

138,339.—*Steam-Power Air-Brake.*—HUGH L. MCAVOY, Baltimore, Md. Application filed January 22, 1873.

A reservoir is connected directly with the boiler of the locomotive, the steam from which compresses the air in said reservoir. The air passes through pipes to diaphragms in suitable chambers and connected directly to the brakes by the stems of the diaphragms.

Claim.—1. The combination of the locomotive-boiler, an air-compressing reservoir, a pipe connecting the boiler and reservoir, and a pipe or pipes leading from the said reservoir to a brake-operating mechanism, jointly with the method of compressing the air by the direct action of the steam thereon in such reservoir, substantially as herein set forth.

2. The chamber formed by the solid and perforated concavo-convex plates *l l'*, having within it the flexible diaphragm *k* and sliding stem G, connected by the pipes *h''*, *h'*, and *h* to the reservoir E, substantially as and for the purpose herein specified.

3. A series of two or more of the chambers *l l'*, connected together and to the reservoir E by the pipes *h''*, *h'*, and *h* common to the series of chambers, as set forth, for the purpose specified.

4. The stems G operating directly upon the brake-shoes *b*, in combination with the flexible diaphragms *k* forced outward within the chamber *l l'* by the action of compressed air at the back of the diaphragms, as herein set forth.

5. The combination of the air-reservoir E, safety-valve *p*, pipe *c*, cock *d*, and the boiler of the locomotive, as and for the purpose herein set forth.

6. For the purpose of relieving brakes, the combination of the pipe *f*, three-way cock *d*, and reservoir E with the pipes *h*, *h'*, and *h''*, leading to the back of the diaphragms *k* within the chambers *l l'*, as herein shown and specified.

138,340.—*Pruning-Shears.*—WILLIAM MCCRAY, Black Oak, Mo. Application filed April 5, 1873.

A guide in form of an arc of a circle is attached to the upright shank, and the curved shank is carried upon it by a loop. Both the straight blade and the curved work between parallel guide-bars riveted upon the shank.

Claim.—1. The blades A B, handles C D, parallel bars E F, curved arm *f'*, and curved bar H, constructed and arranged in connection with each other, substantially as herein shown and described.

2. The combination of the curved arm G, keepers *h'*, and stop I, with the parallel bars E F, and curved bar H, substantially as herein shown and described.

138,341.—*Lubricator.*—WILLIAM MORRIS, Dayton, Ohio. Application filed April 5, 1873.

A hollow stop-cock in the passage between oil-chamber and steam-pipe, (or steam-chest,) which receives oil when the cock is turned to open the passage from said oil-chamber and shut the passage to the steam-pipe, and which discharges the oil when this is reversed by pressure of the steam, which is admitted by a small pipe connecting with the steam-pipe, so that a current will pass through the cock and back into the steam-pipe (or chest,) and carry the oil in the hollow plug along with it.

Claim.—The combination of the oil-holder A, pipe B, nozzle F, hollow cock C, and the pipe E, combined and arranged with the steam-pipe and steam-chest, or the pipe only of a steam-engine, substantially in the manner described.

138,342.—*King-Bolt for Perch-Carriages.*—JOHN L. H. MOSHER, New York, N. Y., assignor to BREWSTER & CO., same place. Application filed January 18, 1873.

The clip which secures the spring to the bolster serves as a bearing for the shoulder of the king-bolt.

Claim.—The single saddle-clip N, having spring G riveted thereto, and holding the detachable socket-bar K *k'*, in combination with king-bolt J and head-block F, as and for the purpose described.

138,343.—*Lubricator for Steam-Engines.*—WILLIAM R. PATTERSON, Chicago, Ill. Application filed March 1, 1873.

The oil-reservoir is connected with the steam-chest above and below. It also has a tube for the purpose of being filled with oil, and a tube for its outlet, which is effected by pressure of steam from the chest.

Claim.—An oil-tank, A, connected to the steam-pipes by the pipes C D and E F, and provided with a feed-cock, I, a filling-tube, M, and the pet-cocks P R, and the connecting-pipes having stop-cocks G H, all substantially as specified.

138,344.—*Machine for Driving Brush-Handles.*—PETER PEARTREE, Lansingburg, N. Y., assignor to JOHN AMES, same place. Application filed October 12, 1872.

In a suitable frame are arranged arms and levers for holding a brush-handle, combined with a rack and pinion, and with gear-wheels and crank for driving the handle into a brush.

Claim.—1. The combination of the guides B, arms or frame C, vertical rod D provided at its lower end with a foot-rest or treadle, E, coiled or equivalent spring F, extension bars G *g'*, levers H, arms I, short bars J, arms K *k'*, guide-wheels L, pivoting and adjusting screw-pins M, and slides A' with each other and with the frame A, substantially as herein shown and described.

2. The combination of the shaft V, gear-wheel U, toothed rack S T, and driver R with the adjustable holders K L M and frame A for driving the brush-handle, substantially as herein shown and described.

3. In a machine for driving brush-handles, the pivoted arms K, adjustable grooved wheels L, and adjusting-screw pins M for centering the brush-handles, substantially as herein shown and described.

138,345.—*Automatic Fan.*—PHILIP H. REICHHARDT and MORRIS SCHNAPP, Brunswick, Mo. Application filed March 22, 1873.

Claim.—The arrangement, with the trains A and B, of chronometer mechanism, of the pendulum E, arms D F, and a series of fans, G, with suspending and connecting devices, substantially as specified.

138,346.—*Magnesium-Lamp.*—ISAAC S. RUSSELL, New Market, Md., and HENRY R. RUSSELL, Woodbury, N. J. Application filed March 20, 1873.

A revolving disk between the feed-rollers separates the two wires with which the flame is fed. The governor consists of two wings, which may be more or less inclined in such manner as to expose a greater or less surface to the resisting atmosphere.

Claim.—1. The disk *n* interposed between the feed rollers O O to steady the ribbons and light, as described.

2. In a magnesium-lamp, the governor for the feed-rollers, consisting of the wings W W, operated by the chain of mechanism consisting of the shaft *l*, lever *f*, fingers I I, and bent rod N, all substantially as shown and described.

138,347.—*Gage for Setting Axle-Boxes.*—THOMAS SCOTT, St. Paul, Minn., assignor of one-half his right to ALEXANDER KENRICK, same place. Application filed February 8, 1873.

The shaft of the gage which enters the hub of the wheel is provided with a means of adjustment, which enables it to fit boxes of different sizes.

Claim.—1. A gage for "truing" axle-boxes made with a mandrel adjustable to fit varying sizes of axle-boxes by means of sliding leaves at the top and at the bottom, which leaves form the bearing-surface of the mandrel, substantially as described.

2. The gage for truing axle-boxes having sliding leaves upon its mandrel, and a lengthening device formed by dividing the mandrel and making one part to slide in the other, substantially as set forth and described.

138,348.—*Spring Bed-Bottom.*—ELON G. SHERMAN, Forestville, N. Y. Application filed March 8, 1873.

Long and short longitudinal bars, with square and wedge-shaped transverse bars, compose the frame. The arched slats rest upon coiled and wooden springs, the latter held in a metallic socket attached to the under side of the slats.

Claim.—The combination of the long longitudinal bars D, the cross-bars E, the short longitudinal bars F, and the beveled cross-bars G with the springs A C H, substantially as herein shown and described.

138,349.—*Tempering Harvester-Knives.*—JOEL F. SHIPPEY, Valley Falls, N. Y. Application filed April 1, 1873.

A frame is provided with a series of sockets for the knives, made in such form that the knives can be dropped into them and held in place therein, at the same time permitting the edges to be tempered to be exposed to the action of the heated lead baths.

Claim.—1. A frame or holder, provided with sockets or recesses for receiving and holding the knives or sickle-sections for the purpose of tempering, substantially as described.

2. The slotted holder, provided with hollow or chambered sides, substantially as and for the purpose set forth.

3. The slotted frame or holder A, in combination with the slotted pyramidal or conical projections B and the bands C, arranged substantially as and for the purpose set forth.

138,350.—*Winding-Click of Watches.*—SIMEON C. SMITH, Boston, Mass., assignor of one-fourth his right to FREDERICK CURTIS, same place. Application filed December 21, 1872.

By means of a friction-collar on the winding-arbor, provided with an arm carrying the pawl, the latter is lifted out of engagement with the ratchet whenever the ratchet is turned backward on winding, and is dropped into engagement so soon as the winding is stopped or reversed.

Claim.—1. In watches and other time-keepers, the combination, with the winding-wheel and its pawl or intercepter, of mechanism whereby, during the revolution of said wheel or its arbor in winding up the watch or other time-keeper, said pawl or intercepter is positively lifted and maintained out of contact with said wheel, substantially as and for the purposes set forth.

2. In combination, the wheel *b*, sleeve *e*, pawl *c*, arm *f*, and bar *g*, substantially as and for the purposes stated.

138,351.—*Portable Stock-Feeder.*—JOSEPH M. SPENCER, La Plata, Mo. Application filed January 25, 1873.

A hay-rack is arranged around the outside of a corn-crib, sliding doors in the crib below the rack opening out into a trough, a section of the rack being hinged to be pressed up close to the crib when openings in both coincide, through which to fill the crib.

Claim.—The slatted roofed corn-crib A, having the movable doors *g*, the hog-pen B, the feeding-trough C, and the hay-racks D, all constructed and arranged as described, to form a portable stock-feeder.

138,352.—*Rotary Steam-Engine.*—WILLIAM C. STILES, Nevada City, Cal. Application filed December 4, 1872.

The outer rim of the revolving wheel is made in sections, and each section has a piston secured to it. The sections of the wheel are secured between the disks, with a small space between them to allow for expansion. An elevated bridge supports a cylinder or part of a cylinder with a longitudinal slot through its entire length, and in this cylinder are arranged the sliding abutments, which are closed by springs when the pistons have passed through or in between the said abutments.

Claim.—1. The wheel A with its sectional rim C and pistons *c*, constructed and arranged substantially as and for the purpose above described.

2. The wheel C with its pistons *c*, in combination with the cylinder G, when said cylinder is applied to the whole or only a portion of the rim, in the manner and for the purpose substantially described.

3. The cylinder G with its abutments K K and longitudinally-slotted bottom, in combination with the sectional rim C and pistons *c*, substantially as and for the purpose above described.

4. The thin metal edge-strips *s*, in combination with the wheel C, constructed as described, substantially as and for the purpose described.

138,353.—*Blacking-Brush.*—F. W. CARUS VON KESSLER and AUGUST F. MEDENWALD, Chicago, Ill. Application filed March 18, 1873.

A shoe-brush in ordinary form, with its handle separated and a scraper introduced, supported by side pieces for its free passage in and out, and connected with a knob outside the handle to operate it, and is detained in its free passage by a spring attached to the under side of it.

Claim.—The combination, with the shoe-brush handle A, having the cavity *a* and slot *b*, of the scraper B, provided with the stud *c* and spring *d*, as and for the purpose set forth.

138,354.—*Machine for Gumming Saws.*—KARL WEINBERGER, Milwaukee, Wis. Application filed December 31, 1872.

A rotatable emery-wheel on an upright frame hinged at bottom; a rigid curved arm located beside the frame, and two adjustable collars on said arm to limit the extent of movement of the frame.

Claim.—The sliding or adjustable stops G and H, and the fixed curved bar F, in combination with the vibrating frame B, carrying the arbor C, with emery-wheel D mounted thereon, as and for the purpose specified.

138,355.—*Coal-Screen.*—STEPHEN W. WOODWARD, Buffalo, N. Y. Application filed December 31, 1872.

A reciprocating motion is given to the screen by means of toggle-jointed levers operated by crank.

Claim.—1. The toggle-levers *f* and *h*, in combination with the bent arm *d*, slotted piece D, and cranks I J, or their equivalents, for imparting a reciprocating motion to sieve B, substantially as described.

2. The combination of the bent piece *d* and screen-box B, when constructed, as shown and described.

138,356.—*Billiard-Cushion.*—HENRY A. ALDEN, Matteawan, N. Y. Application filed March 15, 1873.

The inserted spiral spring gives longitudinally as well as transversely.

Claim.—The combination, with a vulcanized India-rubber billiard-cushion, of a spirally-coiled metallic spring embedded in said cushion at or near the upper and inner corner of the same, substantially as and for the purposes herein set forth.

138,357.—*Method of Perfecting Veneers.*—AARON H. ALLEN, Boston, Mass. Application filed December 14, 1872.

The imperfect portions of veneers are cut out by a peculiarly-formed punch and perfect pieces cut by the same punch inserted in their places.

Claim.—The method of cutting out imperfect portions of veneers and fitting new pieces therein, substantially as herein described.

138,358.—*Composition for Covering Steam-Boilers.*—JOHN M. ALLISON, New Albany, Ind. Application filed February 27, 1873.

Composed of fire-clay, wood ashes, pulverized charcoal, coarse salt, mixed with hair and water.

Claim.—The within-specified materials, compounded substantially as and for the purpose set forth.

138,359.—*Photographic-Plate Holder.*—HENRY T. ANTHONY, New York, N. Y. Application filed January 24, 1873.

The plate-frame is provided with vitrified or other corner pieces to receive the plate in the ordinary position, as usual; but, in addition, the wooden frame is provided with ledges arranged in the same plane as the surface of the corner-pieces, so that the plate, when changed in position, shall rest on said ledges instead of the corners.

Claim.—The ledges *i i* within the frame *a* upon the same plane as the surface of the corners *d d*, in combination with the said corners *d*, as and for the purposes set forth.

138,360.—*Bolt for Doors.*—STEPHEN D. ARNOLD, New Britain, Conn.; assignor to P. CORBIN and F. CORBIN, same place. Application filed April 12, 1873.

A spring-dog is hinged to a mortised bolt-stock and operated by pressure on a push-pin passing into and through the outside knob, concealed in an indentation on top of the same. The bolt, when projected, is held in place by the dog, which for this purpose is self-acting, but slides freely when the bolt is being withdrawn. A coiled spring around the bolt may be added to make its movement automatic when the dog is pushed back, the locking device operating to prevent the bolt from being shaken or displaced by efforts to open the door from the outside.

Claim.—The dog *f*, hinged to the stock *c* of the bolt, in combination with the spring *r* and the push-pin *o* that passes through the knob *d*, as and for the purposes set forth.

138,361.—*Dumping-Car.*—OWEN M. AVERY, Pensacola, Fla. Application filed March 17, 1873.

The car is dumped by means of a beveled bolster and a semi-circular shifting-rocker.

Claim.—1. The stationary bolster D beveled downwardly from middle to each end, and the rocker E pivoted to the middle of said bolster, combined and arranged in connection with a car-dumper, as and for the purpose described.

2. The combination with a stationary rocker-beam, D, and a movable beam, E, pivoted together over the middle of the curved shifter G, arranged and applied as and for the purpose described.

3. The latch I, combined with the shoulders g^1 g^2 on shifter G to lock the latter, in the manner described.

4. The bar H having rectangular notches *h h*, combined with loop *g* of shifter and loop *b* of plate B, as and for the purpose set forth.

5. The combination with bar H having cross-pins at the ends of the cam-shaped lever J, and beam having oval-shaped end c^1, as and for the purpose described.

138,362.—*Butcher's Combined Knife, Saw, and Spring-Scale.*—JOHN BAGGS, Easton, Md. Application filed January 28, 1873.

A narrow saw is attached to arms from the back of a knife-blade, and a spring-scale is contained in the handle, the graduations of weight being marked on the hook-bar.

Claim.—1. A butcher's implement, consisting of a knife, A', separate saw-blade G, tabular handle A inclosing a spiral spring, M, disk I, and sliding graduated plates K provided with a suspension-hook, P, as herein shown and described.

2. The pivoted suspension-hook P, arranged as shown, and combined with a spring, R, for the purpose specified.

138,363.—*Cotton-Chopper.*—CLEMON BAILEY and GEORGE K. BAGBY, Kinston, N. C. Application filed March 8, 1873.

Two bars, which are easily applied to an ordinary plow, support the chopper and its operating mechanism.

Claim.—The means of holding the wheels G H I and shafts to the beam A, consisting of the bars D D, each fastened on one side of said beam and projecting in the rear thereof, as described.

138,364.—*Refrigerator.*—JOHN J. BAILEY, New York, N. Y. Application filed March 21, 1873.

The hollow walls of the refrigerator are provided with air-tubes, which are surrounded by ice for cooling the air before it enters the refrigerating-chamber; and in the top of said chamber is placed a semi-cylindrical-shaped vessel having air-tubes covered with ice for the purpose above mentioned.

Claim.—1. The hollow walls of the refrigerator provided with vertical air-tubes and one or more lateral pipes, *g*, passing through the sides of said walls, as and for the purposes set forth.

2. The vessel *l* of a semi-cylindrical shape, and applied in the top of the refrigerating-chamber, and provided with vertical air-tubes *m* and lateral tubes *n n*, as and for the purposes set forth.

138,365.—*Toy.*—CORTLAND BALL, Augusta, assignor of one-half his right to THOMAS MARRIOTT, Detroit, Mich. Application filed December 14, 1872.

The shell of the toy is furnished with a vibrating strand fast at each end and lengthwise of its mouth. The whole, being attached to a cord and whirled, is resonant.

Claim.—The hollow whirling-toy A B C, constructed for use, substantially as described.

138,366.—*Machine for Thrashing and Hulling Clover.*—ISAAC T. BARTON, Union City, Mich. Application filed February 14, 1873.

By means of a slotted concave and an inclined way the greater portion of the chaff and seed is conveyed directly from the thrashing to the hulling cylinder. Imperforate ratchet-conveyer to convey the chaff and seed in an opposite direction from a perforated straw-carrier. Arrangement of sieve in elevator.

Claim.—1. The combination of the thrashing-cylinder A, slat concave A', hulling-cylinder B, and concave B', arranged, as herein described, to separate the straw from the mingled chaff and seed, and cause the bulk of the latter to pass from the thrasher through the concave directly to the hulling-cylinder, as explained.

2. The conveyer K with ratchet-teeth or ribs *n*, slat bottom *m*, and supplemental riddle R, all constructed and arranged substantially as herein described.

3. The reciprocating imperforate ratchet-conveyer L depressed toward the tail of the machine, and employed, in combination with the reciprocating straw-carrier K, constructed as described, to convey to the huller the seed and chaff separated from the straw by the said carrier K, as explained.

4. The sieve *g* placed in the bottom of the elevator G, in combination therewith, substantially as specified.

138,367.—*Brackets.*—LOUIS BENECKE, Brunswick, Mo. Application filed March 22, 1873.

The bracket is made of one piece of pasteboard or sheet metal, and the supporting-braces are cut out of the back of the bracket just below the shelf and turned out to support said shelf.

Claim.—A bracket made of pliable material, consisting of the back or wall B, supporting-braces D cut in the wall in such a manner that the upper and outer edges *c d* will be free, while the vertical edges *e* remain adherent to the back and the shelf A bent over in the manner as described.

138,368.—*Glass-Mold Carriage.*—DANIEL BENNETT, Baldwin township, Allegheny county, and MICHAEL KEEBS and JONATHAN HALEY, assignors to THE CRYSTAL GLASS COMPANY, Pittsburg, Pa. Application filed April 19, 1873.

Truck with wheels near front; sliding bed supported on truck-frame; molds placed thereon. Rear end of truck run into furnace and bed carrying molds slid back into furnace. Molds being heated, bed is slid forward, and the molds carried on truck to press.

Claim.—1. An apparatus for heating molds for the manufacture of glassware, comprising a portable carriage or frame, adapted and arranged to be run into and out of the heating oven or chamber, in combination with a mold-supporting bed or plate sliding lengthwise in or on said carriage, substantially as herein shown and described.

2. The combination of the carriage or frame, its supporting wheels or truck, and the sliding mold-supporting bed, under the arrangement and for operation as shown and set forth.

3. An apparatus for heating molds, consisting of the parts herein described—namely, the carriage or frame and draft-pole or handle, the sliding mold-supporting bed or plate, the truck or wheels, and the hinged leg or support and its latch—the said parts being arranged together for joint operation, substantially as shown and set forth.

138,369.—*Quilting-Frame.*—BEVERLY BLACKSTONE, Warren, Ill. Application filed February 8, 1873.

The quilting-frame is extensible in length and breadth by its side and end rails being composed of double bars sliding longitudinally upon each other.

Claim.—1. In a quilting-frame, the adjustable bars or rails A A' B B', held together by the keepers *a a' b b'* and set-screws *c*, substantially as shown and described.

2. The keepers *b*, in combination with the pivoted side rails A A' and end rails B B', arranged to operate substantially as shown and described.

138,370.—*Clamp for Dental Purposes.*—CHARLES E. FLAKE, San Francisco, Cal. Application filed March 5, 1873.

A spring metal clamp of the general shape of the letter U has its serrated jaws formed to fit the sides of the teeth and hold thereon the "rubber-dam," which is a piece of sheet rubber used to prevent the saliva from flowing into the cavity during the process of filling a tooth. This clamp is furnished at one side with an orifice, through which the filling may be inserted in the side of the tooth, and also with a similarly-perforated arm, which adjusts on the main clamp by a slot and set-screw.

Claim.—1. A rubber-dam clamp, provided with serrated jaws, adapted to grasp the tooth, substantially as described.

2. The construction of the clamp A with the adjustable compress *a'*, as described.

3. The clamp B, having one end enlarged and perforated, substantially as and for the purpose described.

138,371.—*Hemmer for Sewing-Machines.*—EZEKIEL BOOTH, Great Bend, Pa. Application filed March 11, 1873.

The case or hem turning portion is composed of two parts; the one at the receiving end contains the tongue, about which the edge is turned, and the parts may move with reference to each to adapt the case material of different thicknesses. The movable tongue-plate supports the material between its edge and the gage.

Claim.—The gage G, in combination with the case C C' and tongue T, constructed and operating substantially as shown and described.

138,372.—*Work-Box.*—WILLIAM BRACE, Washingtonville, Ohio. Application filed April 5, 1873.

Claim.—The case C, provided with drawers D D therein, the needle-cups F F, and apartments E E thereupon, swiveled to the movable base A, and having handle G on top, as and for the purpose described.

138,373.—*Self-Tamping Torpedo.*—STEPHEN A. BRIGGS, Tidioute, Pa. Application filed February 1, 1873.

Semicircular tamping-jaws adapted to be drawn up the conical head, and thereby contract so as to be readily inserted into the bore of the well, and act as stops for the head upon explosion of the charge.

Claim.—1. The combination, with the cone C, of the semicircular jaws D D and the elastic band K, substantially as specified.

2. The combination, with the cone C, of the semicircular jaws D D, the rods I I, the cross-bar J, and the plate B, substantially as specified,

138,374.—*Washing-Machine.*—WILLARD P. BROOKS and JOHN D. HARTZELL, Ozawkie, Kans. Application filed August 30, 1872.

The upper fluted roller has metallic plates on the ends, the edges of which bear upon bands on the ends of two or more lower rollers. Endless rubber bands are placed around projections on the outside of the frame, and around pulleys on the journals of the upper roller, and grooved bars are placed beneath the under rollers to brace the frame and direct the water.

Claim.—1. The ribbed and bed rollers D E, provided with end plates *f* and bands *s* to support the said ribbed rollers, as described, whereby the ribs of the roller E are protected from wear, as set forth.

2. The fixed projections *g* of the head-blocks C, and the spools *i* on the roller axis to receive and hold the rubber bands *h* without rolling motion, and thereby save them from wear, as described.

3. The longitudinal bars G, grooved on their under sides, and arranged beneath the bed-rollers D, to let out the water from said rollers, prevent the clothes from being drawn under them, and to brace the end pieces C C, as described.

138,375.—*Vacuum-Pan.*—AURELIUS P. BROWN, Upperville, Va. Application filed January 11, 1873.

The vacuum-pan is filled with the liquid to be evaporated or distilled, and a vacuum created by means of the dependent pipe.

Claim.—The combination of an evaporating-pan with the pipe *e*, as and for the purpose described.

138,376.—*Slide-Valve.*—JAMES L. BROWN, Brookville, Pa. Application filed February 11, 1873.

A link is pivoted to each end of the valve; said links cross each other and are pivoted to the arms of a rocking shaft, which passes through the steam-chest and operates the valve.

Claim.—The combination of the rock-shaft A, and the arms B B, and the links C C, and the valve D, and the ports E E, substantially as and for the purposes described.

138,377.—*Gas Apparatus.*—JOHN W. BROWN, Butlerville, Ind., and HENRY B. WEST, Put-in-Bay, Ohio. Application filed September 2, 1872.

The washers, purifier, and gas-holder are inclosed within one vessel, which is attached to the top of the furnace, and the apparatus is provided with an automatic arrangement whereby the same is made self-regulating.

Claim.—1. The combination of the washers, purifier, and gas-holder, when the same are constructed as described and set forth.

2. The construction of the washers H^1, H^2, and L, and purifier C, when the same are constructed substantially as described.

3. The automatic arrangement by which the apparatus is made self-regulating, substantially as described.

138,378.—*Machine for Cutting Splints.*—CHARLES P. CLARK and CHESTER D. CLARK, Beaver Dam, Wis. Application filed December 13, 1871.

The splint-cutter is drawn under the block by the rotation of a wheel winding on its periphery a strap, by which another hollow wheel, having a coiled spring within it, winds up said spring, which, at the proper moment, draws back the cutting device for the succeeding cut.

Claim.—1. The combination of the block B' carrying the cutter C, with the shaft J, mandrel K, clutches L L', wheel K, strap H, wheel I^1, Shaft R, and spring *m*, all arranged as and for the purpose described.

2. The spring I and guides G G, arranged substantially in the manner and for the purpose set forth.

138,379.—*Washing-Machine.*—GEORGE J. COLBY, Reading, Mich. Application filed March 21, 1873.

A washing-machine constructed with side or end pieces, with a cross-bar to secure it to a tub having a bed of small corrugated rolls, attached separately to coiled springs resting in slots in the frame, by which each has an independent action, with an upper larger roll resting upon the smaller ones, and is held in contact by a hook on the journal pivoted to the outside of the frame.

Claim.—The combination of the frame A B C, crank-roller D, smaller independently-operating rollers H, button-hook G, cleat I, and thumb-screw J, all constructed and arranged substantially as and for the purposes herein set forth.

138,380.—*Candle-Mold Tip.*—ISAAC COLE, Brooklyn, N. Y., assignor to C. C. BEGGS & Co., Pittsburg, Pa. Application filed March 29, 1873.

The groove when filled with packing causes the tip to close the end of the mold in such a manner as to prevent the exudation of wax from between the mold and plug or tip.

Claim.—The groove *g* in the side of the plug or movable bottom *b*, adjacent to the sides of the mold *a*, for the reception of packing, substantially as and for the purposes described.

138,381.—*Sewing-Machine.*—DAVID H. COLES, New York, N. Y. Application filed April 9, 1873.

The needle-bar reciprocates within a reciprocating sleeve provided with eyes that, in connection with an eye on the needle-bar, serve the purpose of a take-up for the thread. The sleeve is moved from the crank through the link, and a pin on the link enters a slot in a plate secured to and moves the needle-bar.

Claim.—1. The movable sleeve D, provided with one or more eyes and moved up and down in the face-plate by means substantially as described, in combination with the needle bar or slide arranged within such sleeve, as herein shown, for the purpose specified.

2. The combination of the crank B, connecting-rod C, and cam-groove *h* with the needle-slide F and sleeve or guide D, substantially as set forth.

138,382.—*Composition for Kindling Fires.*—JOHN C. CRUMPTON, Allegheny City, Pa. Application filed December 11, 1872.

Claim.—The composition for kindling fires, consisting of resin, sawdust, paraffine, and pulverized coal, above described.

138,383.—*Horse-Collar Lining.*—DEXTER CURTIS, Sun Prairie, Wis. Application filed February 24, 1873.

Claim.—A lining for horse-collars, collar-pads, and other parts of a harness, formed of imperforate sheet-lead, and applied to the parts to conform to their bearing-surfaces and to the corresponding parts of the animal, substantially as described, for the purposes specified.

138,384.—*Feed-Regulator for Grinding-Mills.*—JOHN C. DUNLAP, Moffat's Creek, Va. Application filed January 30, 1873.

The annular-chamber secured in the eye of the runner-stone, and revolving with the same, secures an even delivery of the grain to the burrs.

Claim.—1. The annular chamber K, having a sloping bottom and an orifice at the lower part thereof, and placed in the eye of the runner, substantially as and for the purpose specified.

2. The combination of the runner L, annular chamber K, having a sloping bottom and an orifice therein, and the spout S, substantially as and for the purpose specified.

138,385.—*Stove-Pipe Shelf.*—WILLIAM B. ELLIOTT, Corning, N. Y. Application filed March 28, 1873.

The device is fitted to the pipe by an opening on one side of it, on the sides of which are hooks, into which the shaft of the holding-cam is fitted, and may be adjusted to pipes of different sizes, and is supported by projections or brackets projecting downward to sustain it.

Claim.—The cam-lever *h* with a concave face suspended to the transverse shaft *c*, in combination with the stove-pipe shelf having the brackets *c* and the hooks *d* extending upward from each lateral edge and turned inward toward the stove-pipe, as shown and described.

138,386.—*Boat-Detaching Apparatus.*—CHARLES A. ENELL, Philadelphia, Pa. Application filed February 4, 1873.

Claim.—The combination of the bolt L having locking-grooves on the under side of its head extending upwardly into the head, and the hooks K having upwardly-projecting locking-ends, when constructed, arranged, and operating together as herein set forth.

138,387.—*Washing-Machine.*—GEORGE W. FAGAINES, Shelby, Ohio, assignor of one half his right to JOHN COTNER, same place. Application filed March 22, 1873.

An attachment to a washing-machine for holding it to the tub, by a slide connected to the bottom, secured to it by a set-screw in a slot, and held in position by brackets, with a device on its other end fitted to the form of the tub with holes to attach it by pins or screws.

Claim.—The extension bottom, consisting of the bars D D', placed one under the other, and held together by the keepers *d*, in combination with the fastening brackets B, substantially as shown and described.

138,388.—*Row-Lock.*—THOMAS FEARON, Yonkers, N. Y. Application filed March 10, 1873.

The socket which surrounds the sleeve on the oar is provided with a pivot and flanged feet, which latter retain the socket in the trunnion-plate and admit of the lateral play of the oar. A spring attached to the outrigger bears against the trunnion-plate and assists in supporting the weight of the oar.

Claim.—1. The combination of the socket C, provided with a pivot *s* and flanged feet A A, with the trunnion-plate, constructed as described, substantially as and for the purpose herein set forth.

2. The combination of the spring S, arranged on the outrigger A, and the trunnion-plate B, substantially as and for the purpose set forth.

138,389.—*Musical Wind-Instrument.*—ISAAC FISKE, Worcester, Mass. Application filed March 15, 1873.

Claim.—The relative arrangement of the valve-cylinders, having valves and valve-pistons connected, as described, with the crooks and connections for producing the open and valve tones, substantially as specified.

138,390.—*Prescription-File.*—ALBERT D. FOSTER, Council Bluffs, Iowa. Application filed March 25, 1873.

Two boards are placed one upon the other, each having an eyelet-hole centrally located near its end, through which a wire passes; said wire is rigidly attached to the under side of the lower board.

Claim.—The pasteboard piece A, provided with the wire C fastened to the same by an eyelet, *a*, and passing through the hole *b*, in combination with the piece B having eyelet-hole *d*, substantially as and for the purposes herein set forth.

138,391.—*Let-Off Mechanism for Looms.*—CHARLES GARREN and LOUIS LANGLOTZ, New York, N. Y., assignors to MORITZ COHN, same place. Application filed February 24, 1873.

To equalize the tension and prevent the crowding of the warp in a corset-weaving loom having a sectional warp-beam, the threads that pass convergently to the heddles, instead of being reeled off directly from the beam to the fabric, are first passed over a tension-bar connecting the two arms of the bifurcated tension-lever of the let-off mechanism and placed obliquely to the axis of the warp-beam.

Claim.—In combination with the warp-beam E, the tension-bar *f*, arranged obliquely to the axis of the beam, and arranged to operate in the manner and for the purpose described.

138,392.—*Hand Corn-Planter.*—HENRY GORTNER, Nashport, Ohio. Application filed October 19, 1872.

The upright pieces which form the sides of the machine are hinged near the bottom, and are provided with openers which penetrate the ground. The seed-valve consists of a curved triangular block, which is pivoted at its lower end to the side of the box below the seed-box. The side pieces are limited as to expansion.

Claim.—As an improvement on my patent dated November 5, 1872, the pivoted angular seed-slide described, having the leg D, the slotted adjustable Z-shaped gage G, and the segmental piece F, constructed and arranged substantially as specified.

138,393.—*Hydraulic Wheel-Presses.*—GEORGE A. GRAY, Jr., Hamilton, Ohio. Application filed August 20, 1872.

In connection with the ordinary valve-chamber of a pump two plungers of unequal sizes are arranged to operate, one belt being used for both plungers. The large plunger being set in motion the forcing-cylinder is rapidly filled and the work is partially accomplished. When the pressure reaches the limit of power of the large plunger the belt is shifted and the small plunger completes the work by increasing the pressure to the safety-valve limit.

Claim.—1. In a hydrostatic press, the combination, with a single pump, of plungers H and I of unequal area, and arranged for independent action, substantially as and for the purpose specified.

2. The combination, in a hydrostatic press, of the plungers H I of unequal areas, rods J N, crank and eccentric K O, shafts L P, and driving-pulleys M Q, connected and operating substantially in the manner and for the purpose specified.

138,394.—*Machine for Turning Pulleys.*—GEORGE A. GRAY, Jr., Hamilton, Ohio. Application filed August 20, 1872.

The bed-plate revolves horizontally and is provided with a center. A tool-block way is supported above it by two pillars. This way also holds a center-pin and two tool-blocks which operate on opposite sides of the pulley. The pulley to be turned is placed on a mandrel between the centers, and two pins on opposite ends of the dog adjust themselves to its arms by means of slots in the dog, through which screws pass to hold it to the bed-plate, and which allow it to slide from side to side until both pins bear against arms on opposite sides of the wheel.

Claim.—The combination, in the usual or suitable frame-work of a pulley-turning machine, of revolving table F, tail-block E, self-adjusting driving-dog I J K, and adjustable cutters L M M', the parts being connected together and the whole operating substantially in the manner and for the purpose specified.

138,395.—*Dumping-Wagon.*—OLE GUNBULDSON, Christiana, Wis. Application filed February 10, 1873.

Permanent partitions extend across the frame and serve to close the open ends of the boxes, which are so connected by chains or ropes that each one, in dumping its load, will elevate an adjacent box, previously tilted, and lock it to its support.

Claim.—1. The combination of the dumping-boxes A, their supporting-levers and permanent partitions or timbers B', all arranged and to operate substantially as specified.

2. The dumping-boxes A connected by chains H or their equivalents, substantially as and for the purpose specified.

3. The combination of the eccentrically-hung dumping-boxes, their supporting-levers and chains H, substantially as and for the purpose specified.

138,396.—*Bird-Cage.*—GOTTLOB GÜNTHER, New York, N. Y. Application filed March 14, 1873.

Claim.—The combination of stationary hooks, (one or more,) secured in or on the bottom of a cage with one or more buttons which swivel in standards rising from said bottom, and which work in a slotted piece of metal attached to the bottom of the cage, substantially in the manner herein shown and described.

138,397.—*Balanced Valve.*—ARTEMAS N. HADLEY, Richmond, Ind. Application filed December 11, 1871.

A steam-engine slide-valve and steam-chest is combined with a piston, sliding in a loose ring, that bears against the steam-chest

cover, and a regulating valve or cock in the cover admits air to the back of the piston to assist in balancing the valve. The loose ring is forced against the cover by coiled springs around studs on the back of the valve that bear against projecting lugs on the ring.

Claim.—The combination, with a steam-engine slide-valve and steam-chest, of the piston H, floating ring I, and regulating valve or cock Q, substantially as and for the purpose set forth.

138,398.—*Fertilizer-Distributer.*—DAVID F. HALLIBURTON, Rutherford Station, Tenn. Application filed October 26, 1872.

A hopper and frame, supported in the rear by a pair of wheels, are intended to be attached to a wagon or cart by a tongue that can be folded under the bottom of the frame. Removable partitions in the hopper render it available for drills or broadcast distribution. The wheels, by cranks and rods, revolve a studded roller placed beneath laterally to draw the manure from the bottom of the hopper and scatter it.

Claim.—The manure-distributing machine, constructed as described, having the inclined wall L, vertical partitions G, studded roller D, removable divider I, and the removable side-boards H, substantially as specified.

138,399.—*Quilting-Attachment for Sewing-Machines.*—WILLIAM H. HEPPLEY, Rochester, Ind., assignor of one-half his right to CHARLES ASA MITCHELL, same place. Application filed July 19, 1872.

The movable quilt-carrying carriage is provided with a roller or stud that enters one of the grooves in the removable plates, and as the carriage is moved forward by the feeding device it has also lateral movements to correspond with the shape of the groove then used. The positions of the curves and angles of adjacent lines of stitching may be varied by moving the plates longitudinally, the lever serving for this purpose. The rocking frame allows the rollers to move toward or from the cloth-plate as the material passes from one to the other and their sizes change.

Claim.—1. A pair of removable plates grooved in various patterns, applied to a sewing-machine, and guiding a carriage or frame provided with rollers upon which a quilt or other article is held while being stitched or quilted, substantially as described, for the purpose specified.

2. The grooved plates D D′ connected by the rod E and operated by the lever F, in combination with the frames B B′ and carriage H, substantially as described.

3. The carriage H′ provided with the rocking adjustable quilting-frame, substantially as described, for the purposes specified.

4. The rocking adjustable quilting-frame having the curved end pieces S S′ supported by the end blocks U U′, substantially as described, for the purpose specified.

5. The combination of the rocking adjustable quilting-frame and the end blocks U U′ adapted to be locked in any required relation to each other by means of the ratchet *s* and the screw-rod T, or their equivalents, substantially as described, for the purpose specified.

138,400.—*Dumping-Platform.*—WILLIAM W. HINMAN, Elkhart, Ill., assignor of part interest to SAMUEL B. HUNTER and JOHN GIBBS, same place. Application filed March 21, 1873.

The front of the wagon rests on the bar. By means of the wheel and axle this bar is raised, carrying with it the front of the wagon, and thus dumping its contents into the trap.

Claim.—The combination, with a platform, A, having trap-door B, of the cases G G, sliding bars E E with cross-bar H, cords or chains *a a*, shaft C, and wheel D, all constructed and arranged substantially as and for the purposes herein set forth.

138,401.—*Toy.*—FRANCIS HUBBARD and EDWARD B. SEVERANCE, Durham, Conn., assignors to THE MERRIAM MANUFACTURING COMPANY, same place. Application filed February 21, 1873.

To avoid the clatter of the ordinary wheeled tin toys the axles are provided with leather, wooden, or other non-metallic collars.

Claim.—In that class of toys formed from sheet metal, and which are arranged upon or with an axle, the bearings E for the said axle, when formed of leather or other non-metallic material to prevent the axle or wheel coming in contact with the metallic portion of the toy, substantially as set forth.

138,402.—*Wagon-Standard.*—JOHN L. HUDSON, Cumming, Ga. Application filed March 27, 1873.

Formed from a simple flat piece of metal.

Claim.—The combination, with the bolster A and its plate D, of the standard and brace B C, made of one piece of flat metal, with a tenon passing through the bolster, and secured by the nut *a* on one side and by the nut *d* on the other, and the thimble A between the parts, through which is passed the bolt *b*, all as and for the purposes set forth.

138,403.—*Broadcast-Seeder.*—J. DEAN HUFFMAN, London, Ohio, assignor of one-half his right to C. M. THOMPSON, same place. Application filed February 12, 1873.

A fixed hopper is suspended upon a fixed stem the lower part of the hopper telescoping with the revolving seed-distributer. The seed is conveyed to the distributer on the side next to the body of the operator, and in this manner the seed is all thrown forward or at right angles to the line of progression.

Claim.—1. The fixed hopper D suspended upon a fixed stem, E, and with its neck telescoping with a revolving seed receiving and distributing chamber F, supported by the same stem E, from which the hopper is suspended, the periphery of said chamber forming the driving-pulley, as and for the purpose described.

2. The wire-armed collar-bearings *e* for steadying the motion of the chamber F, to serve as stirrers, and assist in discharging the seed, as described.

138,404.—*Traction-Wheel.*—OLIVER HYDE, Oakland, Cal. Application filed February 28, 1873.

Improvement in Letters Patent No. 117,174, July 18, 1871. Method of applying rubber tires to traction-wheels.

Claim.—1. A traction-wheel having its rim provided with one or more parallel troughs or channels, *a a*, the bottoms of which are formed into concave beds for the reception of elastic cylinders *b b*, substantially as and for the purpose above described.

2. The shoe C with its parallel channels or troughs *g g e* arranged to provide a bearing for four or more of the elastic cylinders, and attached to the wheel by a flexible connection from its center, substantially as and for the purpose above described.

3. In combination with the shoe of a traction-wheel, the eye *f*, links F, and eyebolts *i*, with its nuts G G′, substantially as and for the purpose above described.

4. The troughs *a a*, separated by the plate H, in combination with the elastic cylinders or rolls *b b* and shoe or block C, with its troughs *g g*, all arranged in the manner and for the purpose above described.

138,405.—*Car-Coupling.*—ELI H. JANNEY, Alexandria, Va. Application filed April 1, 1873.

The arm *a* of the draw-head of one car striking the arm *b′* of the hook B in the draw-head on the approaching car, throws it back until it is held by the catch C. This operation throws the heads of the hooks B into connection, and the coupling is effected.

Claim.—1. The combination, in a car-coupling, of a rotary hook, B, guard arm *a*¹, and automatic catch-lever C, substantially as described.

2. In combination with a draw-head having arms *a a*¹, the hook B, all constructed and operated as described.

138,406.—*Auxiliary Table.*—ELBERTA JOHNSON, McLean county, Ill. Application filed February 27, 1873.

The auxiliary table is supported on one leg, and is connected to the main table by a pivoted arm having a sliding joint, and is held in position by one or more hooks.

Claim.—The combination, with a dining or other table, A, of the supplementary table B C, pivoted arm D, vertical spindle *b*, sliding joint *d*, and one or more hooks, *h*, all constructed substantially as set forth.

138,407.—*Fanning-Mill.*—JOHN W. JOHNSON, Port Treverton, Pa., assignor of two-thirds of his right to IRA SAYRS, same place. Application filed March 31, 1873.

Claim.—1. The vibrating shoe C provided with the inclines D H H′, screens E and I, in combination with the detachable supporting-links *c c′*, all constructed, arranged, and operating substantially as described.

2. The double reversible incline grass and clover seed screen F having the inclined middle board *f′*, arranged and operating substantially as and for the purpose set forth.

3. The screen E having a plane upper face and provided with transverse slots and pendent angular lips or flanges, substantially as and for the purpose set forth.

4 The pivoted long screen I, provided with the finer lower screen *i*² and pivoted valve J, constructed, arranged, and operating as and for the purposes described.

138,408.—*Middlings-Separator.*—HORACE P. JONES, Springfield, Ohio. Application filed February 15, 1873.

Devices for equalizing and regulating the current and draft of air through the pivoted sleve.

Claim.—1. The tapering triangular openings *j j* for equalizing the current, in combination with the adjustable gate *n* for regulating the draft of air, arranged substantially as specified.

2. The combination of the pivoted graduated sleve B with the induction openings P, tapering triangular openings *j j*, fine N, and fan and casing M, arranged substantially as shown and described.

138,409.—*Apparatus for Carbureting Air.*—THORWALDSEN JUDD, and ELLIS DOTY, Janesville, Wis., assignors to THE PHILADELPHIA GAS-MACHINE COMPANY, Philadelphia, Pa. Application filed January 14, 1871.

The central space or chamber C gives the wheel a double capacity both to gather and discharge the air, and produces a more continuous and uniform supply than can be obtained from a single wheel. The hinged buckets fill in passing through the space L′, and in passing upward they are tilted by striking a fixed rod and discharge their contents into a tray, from whence the gasoline passes through a sealing-pipe to the distributing-tray.

Claim.—1. The air-wheel B, divided to form a central exit-chamber, C, in combination with the two end-receiving air-chambers D and the open inner discharging ends *c* of the wheel, as and to produce the advantages described.

2. The arrangement of the central air-exit chamber C with respect to the fixed generating-surface G, to cause the air from the wheel to impinge against the middle of the generator and forced over both ends thereof to obtain a more uniform contact of the air with the generating-surface, as described.

3. The hinged tilting buckets *f* of the gasoline-supply wheel M, in combination with the tilting-arm *g*, the receiving-tray N, and the conducting sealing-tube O, arranged to operate as described.

4. The sealing-pipe O, arranged to conduct the gasoline from the feed-wheel to a sealing-cup, A, beneath the gasoline-chamber L, and thereby effect an open feed-communication between the gas and the gasoline-chambers, and prevent the escape of the gas into the latter, as shown and described.

5. The pipe S, arranged to connect the water-chamber A with a waste-chamber, J, for the purpose of carrying off the waste gasoline from the surface of the water and automatically regulate the

height of the fluid within which the air-wheel revolves, as described.

6. The winding and driving clutch of the air-wheel, having eccentric grooves *k* and rubber balls *j* to render the parts noiseless in winding, and to allow the weight to be unwound without reversing the motion of the air-wheel, as described.

138,410.—*Fire-Escape.*—WILLIAM KEGG, Lasalleville, N. Y. Application filed September 24, 1872.

The rope is wrapped around the grooved pulley with no center bearing, in a single turn, so that the ends can be alternately used for descending. The revolutions are controlled by brake-straps which are constricted by the lever H with cord attached. One of the brake-straps has locking-lugs engaging with a notch in the circumference of the pulley.

Claim.—1. In a fire escape, the arrangement of a pulley, B, with no center-point and a rope, C, wrapped nearly around the same in a V-shaped circumferential groove and passing under suitable brakes, substantially as and for the purposes herein set forth.

2. The locking device for the pulley B, consisting of the bar I with lugs *e e* pressed by the spring J into notches *i i* on the pulley, substantially as and for the purposes herein set forth.

3. The lever H provided with double fulcrums *b b* and arm *f* for simultaneously operating the locking device and the brakes of a fire-escape, substantially as herein set forth.

4. The combination of the casing A A′, pulley B, rope C, brakes D D, lever H, with cord *d*, and locking devices I J, all constructed and arranged to operate substantially as and for the purposes herein set forth.

138,411.—*Apparatus for Cooling Rooms and Buildings.*—THOMAS D. KINGAN, Indianapolis, Ind. Application filed April 4, 1873.

Air circulates through a set of tubes surrounded by a refrigerating mixture, the circulation being induced by a blast of air driven through a bent tube passing horizontally through the ice-box.

Claim.—An air refrigerator or cooler for rooms, buildings, &c., consisting of the rectangular air-tubes *a a′*, having vertical and horizontal arms, and the horizontal tube *g h i i* for the passage of an air-blast, in combination with the surrounding case for a refrigerating mixture or medium, substantially as described.

138,412.—*Thread-Cutter for Sewing-Machines.*—ARTHUR M. LESLIE, Chicago, Ill. Application filed October 2, 1872.

Claim.—1. A thread-cutter, substantially as described, for sewing-machines, having a movable or rotating cutting-edge which presents new or different points to the thread at each cut, for the purpose specified.

2. A thread-cutter for sewing-machines, consisting of two circular cutting-blades pivoted to a holder so as to overlap each other, substantially as described, for the purpose specified.

138,413.—*Machine for Making Links for Ornamental Chains.*—EUGENE ISIDORE LEVAVASSEUR, Paris, France, assignor to HENRICH WITZENMANN, Pforzheim, Grand Duchy of Baden. Application filed September 7, 1872.

The series of punches and dies give the results indicated by the perforated strip of metal and the detached link shown; and to the blade is imparted successively vertical and lateral movements, in virtue of which its point enters every link as they are successively brought within its reach, carries them from the machine, and facilitates their fall and the formation of a column around it convenient for removal to the chain-making machine.

Claim.—1. The rock-shaft *i*, finger *j*, and lever A, actuated by the cam *i′*, in combination with the lever *d*, cam *b*, arm *f*, and tooth *e*, for feeding the strip of metal to the cutting and shaping dies, substantially as set forth.

2. In a machine for making the links of watch-chains, the three-part punches and dies *r s t*, constructed as set forth, to punch out the center of the link, round up the edges of the metal, and to separate the link from the strip, as set forth.

3. The blade *s*³ and its actuating mechanism, constructed substantially as described, and combined with the shaping and cutting dies, for receiving the complete links, as set forth.

138,414.—*Photographic Plate-Holder.*—WILLIAM LEWIS, Brooklyn, N. Y. Application filed October 22, 1872.

Corners constructed so as to reverse the position of plates and hold them steadily in place.

Claim.—The corner for the photographic-plate frame, made with a straight ledge or offset running diagonally to the sides of the frame, as and for the purposes set forth.

138,415.—*Lamp-Filler.*—HUGH H. V. LILLEY, Milford, Mass. Application filed September 21, 1872.

The neck is opened by handles to put the wick through into the bowl of the funnel, which is adjusted upon neck of lamp, with the wick held by spring and the burner hung over the side.

Claim.—1. The improved oil-funnel, consisting of the neck B and bowl A extending within said neck, said funnel being cleft through bowl and neck, substantially as specified.

2. The cleft bowl A and cleft neck B, in combination with the diverging handle F, substantially as specified.

3. The combination, with the cleft funnel, of spring wick-holder E, substantially as specified.

138,416.—*Atomizer-Bulb.*—HAMILTON D. LOCKWOOD, Charlestowa, Mass. Application filed March 5, 1873.

Claim.—A flexible bulb, having, in combination with the air-outlet orifice, an air-inlet controlled by the valve *d*, substantially as shown and described.

138,417.—*Fountain-Syringe.*—HAMILTON D. LOCKWOOD, Charlestown, Mass. Application filed February 7, 1873.

A spring-valve is arranged midway of the elastic delivery-tube, and a small bag of India rubber is joined to the valve-box at right angles to it, in which the end of the valve-stem plays.

Claim.—The valve-box *i*, having combined with the valve *n*, valve-seat *m*, spring *o*, stem *q*, the flexible elastic hollow tip, *r*, substantially as shown and described.

138,418.—*Pin-Hinge.*—ABRAHAM LYONS and ISAAC B. ABRAHAMS, New York, N. Y. Application filed September 21, 1872.

Claim.—In combination with a brooch-pin, the post B, cleft at its head and having an extension, *a*, adapted to be bent over and passed through the eye of the brooch-pin, substantially as specified.

138,419.—*Machine for Making Needles.*—FRANCIS W. MALLETT, New Haven, Conn. Application filed November 30, 1872.

The wires are fed singly from a hopper to a press, where the heads of two needles are formed in the center of the wire; the blank is then fed to a punching-press, where the two eyes are formed, and thence to two horizontal reciprocating and rotating screws, which carry the blank forward. As the blank moves forward it is carried over a mill that removes the fin thrown out by the heading-dies, and then over a pair of pointing-mills, and finally over a pair of finishing-mills.

Claim.—1. In a hopper, substantially such as described, the two cheeks B¹ B², which form the throat *a* of the hopper, one of which cheeks is made adjustable, so that the said throat may be made of greater or less width, substantially as described.

2. In combination with a hopper for supplying the wires, the revolving shaft B², with its cams *a′*, arranged in the relative position to the throat *a*, as and for the purpose specified.

3. The parallel slides D, having an up-and-down and longitudinal reciprocating movement, combined with the jaws *c c*, to receive and translate the blanks for successive operations, substantially as set forth.

4. The longitudinal screws L, constructed with the hook *l* at their ends, arranged to receive the blanks within the grasp of the said hooks, and combined with the mills V and G G¹, over which the blank is carried by the said revolving screws, substantially as described.

5. In combination with the revolving longitudinal screws L, the slide L² and bed H, the said slide L² having a reciprocating movement, substantially as described.

6. The longitudinal revolving screws L, the slide L², and the bed H, the said slide L² and the revolving screws L having each a longitudinal reciprocating movement independent of the other, substantially in the manner and for the purpose set forth.

7. The arrangement of the springs *p* above the flexible stripe *m* in the slide L², substantially as and for the purpose set forth.

8. In combination with the mills G G¹, the bars P P¹, and their pressure-spring R¹, substantially as and for the purpose described.

9. In combination with the mills G G¹, bar P, and its spring R¹, the auxiliary bar P¹ and adjusting-screw P³ to bear upon the said bar, substantially as and for the purpose described.

138,420.—*Marine Steam-Engine Governor.*—OBADIAH MARLAND, Boston, Mass. Application filed January 18, 1873.

A time-keeping motor and steam-controlling valve of a marine-engine are combined with a cam with parallel and inclined grooves and switches, by which the flow of steam is regulated as the speed varies; also, by an arrangement of valves by which, when steam is shut off communication from the cylinder with the condenser is closed and established between both ends of the cylinder, and when the steam is again let on communication is re-established as before. Combined with this arrangement is a donkey-engine so arranged that when the throttle-valve is closed it shall also cause the donkey-engine to make one stroke, by which communication between the cylinder and condenser is closed and opened between both ends of the cylinder.

Claim.—1. The combination, with a time-keeping motor and a steam-controlling valve of a marine steam-engine, of a cam constructed with parallel and inclined grooves and switches, substantially as described.

2. The combination, with an engine, of valves, arranged as described, under the second part of this invention, to prevent or lessen the addition of power to the main piston after steam has been shut off, substantially as described.

3. The combination, with the valves of an engine arranged to perform the function effected by the subject-matter of the second claim, of an auxiliary engine, in such a manner as to automatically operate said valves at the instant when they are required to perform their functions, substantially as described.

138,421.—*Apparatus for Filling Bottles.*—JOHN MATTHEWS, New York, N. Y. Application filed March 21, 1873.

A double tube, one of which passages, for the admission of the liquid, projects below the passage for the egress of the air. By turning the cock the liquid passes into the bottle, compressing the air and forcing it through the air-passage, an escape-valve is regulated, by means of a spring, to the required pressure within the bottle.

Claim.—The improved filling apparatus herein described, composed of a liquid-tube and an air-tube with a pressure-regulating valve, both tubes projecting into the bottle while filling, and the liquid-tube projecting below the air-tube, all substantially as specified.

138,422.—*Screw-Forming Machine.*—WILLIAM A. MCCOOL, Ashland, Ohio. Application filed February 18, 1873.

Claim.—1. The adjustable crank *s*, substantially as described, for adjusting the roller to varying thicknesses of pipe.

2. The adjustable holder *i*, substantially as shown.

3. The screw-shaft *d*, adjustable crank *e*, roller *g*, and mandrel *h*, when combined to operate as set forth.

138,423.—*Tool-Handle.*—WILLIAM H. MCCOY, Miller's Falls, Mass. Application filed December 7, 1872.

The sleeve is made interiorly to correspond with the dovetail shank of the blade. The slot *d* corresponds with a slot, *c*, in the ferrule of the handle. When the blade is to be fastened a quarter turn of the sleeve accomplishes it.

Claim.—The slotted tapering stock D, and the slotted tapering sleeve or nut C, in combination with a tool provided with a tapering shank, B, all substantially as and for the purposes herein set forth.

138,424.—*Mechanical Movement.*—CORNELIUS MEINERS, Indianapolis, Ind. Application filed April 15, 1873.

A toothed wheel, secured to shaft, to which is pivoted a lever having a spring-dog pivoted to its side, which catches in the teeth of the wheel and moves it forward; above this shaft is pivoted a second lever having its upper end slotted and secured to the side of the first lever, while its lower end is semicircular and provided with cogs which mesh with teeth formed on a third lever, pivoted on the shaft, and having a dog secured to its lower end which engages with the teeth of the wheel and moves it forward the instant the dog on the first lever ceases action, so that the action of the wheel is continuous.

Claim.—1. The handle or lever *e*, in combination with the two levers *d g* having their ends geared together, as shown, dogs *i*, and wheel *a*, substantially as set forth.

2. In combination with the dogs *i*, a device for moving them out of gear, substantially as shown and described.

138,425.—*Shingling-Bracket.*—LYMAN W. MERRIAM, Fitchburg, Mass. Application filed August 31, 1871.

A metallic strip is temporarily nailed to the roof, to which the bracket is secured by a slotted shaft, into which the plate is inserted, the shaft being then rotated so as to bend the plate into a hook form, thus forming a sufficiently strong attachment to hold the bracket upon the roof. The wedge-shaped piece is reversible for the purpose of changing the angle to adapt the seat to different pitches of roof.

Claim.—1. A rotary slotted binder, constructed substantially as described, for attaching a roofing-bracket to a roof by means of a metallic strip, in the manner specified.

2. The wedge-shaped piece B, in combination with the frame of a roofing-bracket, for the purpose specified.

138,426.—*Locomotive Head-Light.*—LEWIS MICHAELS, Covington, Ky. Application filed March 7, 1873.

The neck connecting the burner and reservoir is in two parts, joined by the simple scarf-joint, and held in place by a bolt, around which a recess is formed in the tube to allow passage of the oil. The reservoir is provided with a stop-cock to retain oil therein when the burner is disconnected.

Claim.—The combination of the reservoir A, burner B, and two-part neck C D, when the two parts of the neck are connected together by the flat lap-joint *c d* and screw F, arranged and operating substantially as and for the purpose specified.

138,427.—*Refrigerator-Building.*—WILLIAM M. MIXER, New York, N. Y. Application filed March 28, 1873.

The grate for supporting the ice, the joists covered with metal, and the trough for receiving the dripping water are so arranged that the entire under surface of the ice is exposed to the upper surface of the air in the refrigerator.

Claim.—The combination of the metal grate, caps, and gutters over the entire surface of the refrigerator in such a manner as to expose the entire under surface of the ice to the upper surface of the air contained in the refrigerator, substantially and for the purpose hereinbefore set forth.

138,428.—*Furnace for Smelting Ores.*—JOHN NEVILLE, Jersey City, N. J., assignor of one-half his right to THOMAS HOLIHAN, Chicago, Ill. Application filed March 28, 1873.

Each half of the double furnace is provided with separate chambers for desulphurizing, deoxidizing, and carbonizing the ore, and has certain pipes arranged for delivering steam and air into the deoxidizing and carbonizing chambers.

Claim.—A reduction-furnace, having the chambers *a*, *d*, *e*, *g*, and *i*, and the stacks B B, constructed and arranged substantially as herein described and shown, and in combination therewith the steam-pipes *k* k^1 k^2, arranged to operate substantially as and for the purpose set forth.

138,429.—*Combined Rotary Blast and Puddling Furnace for Making Wrought-Iron Direct from the Ore.*—JOHN NEVILLE, Jersey City, N. J., assignor of one half his right to THOMAS HOLIHAN, Chicago, Ill. Application filed March 28, 1873.

A fine opening in the back end of the puddling-furnace discharges the waste heat into the center of a cylindrical stack, which is rotated by the action of a vertical shaft driven by an engine or other motor. The rotary stack contains six or more egg-shaped retorts, open at the top, with a tap-hole at the lower outer end of each. One branch of a steam-pipe, conveying steam from a generator and superheater, is led toward the stack, where it is subdivided, each jet being coincident with one of the openings in the stack, so that a volume of superheated steam is being continually blown into two of the retorts, which present themselves to the nozzles.

Claim.—1. The rotary stack B containing ore-retorts C, in combination with a puddling-furnace, when the reduction of the ore in the said retorts is effected by the waste heat of the puddling-furnace, substantially as described.

2. The arrangement of the pipes D D^2 with relation to the stack B and retorts C for supplying superheated steam thereto, substantially as described and shown.

138,430.—*Hat.*—JAMES O'DONNELL, St. Louis, Mo. Application filed October 21, 1872.

Claim.—The hat herein described having the brim A turned up in a flange, *a*, and the crown C attached to the brim outside of and at a distance from said flange so as to form the chamber D, and having the perforated or open-webbed inner casing B′ attached inside of said flange *a* and between it and the sweat-band B, as shown and described.

138,431.—*Table.*—HENRY W. PEABSALL, Emporia, Kans. Application filed October 19, 1872.

A table-top is finished with a bed of plaster of Paris, ornamented with different colors, and a plate of thick glass placed thereon.

Claim.—A table or counter top, made of a bed of plaster of Paris, or its equivalent, and covered with glass, substantially as set forth.

138,432.—*Press.*—EPENETUS B. PLATT, Florence, Ind. Application September 25, 1872.

A sweep provided with a swiveled seat, and swinging frames for opening and closing the doors.

Claim.—1. The press-boxes *a a′*, platens C C′, screw G, gearing E F, and sweep D, relatively arranged as set forth, in combination with the swinging standards J J′, swinging frames K K′, and suitable tackle for operating the doors B B, substantially as and for the purpose specified.

2. In combination with the swinging doors B B′ the swinging standards J J′ with their sheaves *f f′*, the swinging frames K K′ with their sheaves k'' k''', and the cords *m m′* operating to make the same cord pulled in the same direction act to both open and close the doors.

3. In combination with the sweep D the swiveling seat *d* pivoted to the end of the sweep, substantially as and for the purpose specified.

138,433.—*Car-Spring.*—JOHN B. QUIRK, Philadelphia, Pa. Application filed March 27, 1873.

Bar-springs, peculiarly coiled, are arranged within a case, and a follower rests upon the free ends of the springs. The ends of the springs are limited in their vertical movement by means of shelves, which are arranged within the case.

Claim.—1. The spring A, constructed of a continuous piece coiled or bent at *c*, crossed at *d*, and having free ends *b b*, substantially as and for the purpose set forth.

2. The casing B formed with the shelves D, arranged to operate in relation to the free ends of the spring, substantially as and for the purpose set forth.

3. The stud E of the follower or portion C, in combination with crossed ends of the spring, substantially as and for the purpose set forth.

4. The bearing-block F supporting the spring, in combination with the stud E, substantially as and for the purpose set forth.

5. The casing B with shelves D and bearing-block F, and the follower or portion C with stud E, in combination with the spring A having crossed ends, substantially as and for the purpose set forth.

138,434.—*Plow-Handle.*—JOHN T. RAFTERY, El Dara, Ill. Application filed September 7, 1872.

The main part of the plow-handle is of wood, the upper end being straight, and extended by means of an adjustable curved plate of iron, which is provided with wood casements for the hands.

Claim.—The metallic adjustable slotted handles B having incasements *c*, in combination with the fixed plow-shanks A and bolts *b*, substantially as and for the purpose specified.

138,435.—*Sewing-Machine Cabinet.*—GUSTAV RANGE, New York, N. Y. Application filed April 12, 1873.

A sewing-machine cabinet constructed with openings in the uprights or ends, into which, on one side, is a looking-glass, on the other a desk and book-case, both having weights appended to them by cords running over pulleys, by which they are raised to the top of it, and by pivots turned to its front for use, &c.

Claim.—1. A sewing-machine cabinet-case and looking-glass combined with a frame carrying such glass, and sliding vertically in the said case, substantially as set forth.

2. A sewing-machine cabinet-case and desk or secretary combined with slides in such case in which the secretary or desk is moved vertically, substantially as set forth.

3. A sewing-machine cabinet-case combined with a base sliding vertically, a counterpoise, and a looking-glass or desk turning upon a pivot, substatially as set forth.

138,436.—*Lubricator.*—HENRY W. REGAN, Renovo, Pa. Application filed October 18, 1872.

A measuring cup and valve placed in the bottom of the cup.

Claim.—1. The measuring-valve B B′ arranged within the supply-cup A A′, and filled from its bottom through well *b* and orifice *b′*, and emptied through the same orifice, in conjunction with ports *e e′* and conducting-pipe E E′, one or more, substantially as herein shown and described, for the purpose specified.

2. The measuring-valve B B′ arranged within the supply-cup A A′, and having its axial stem h perforated, as described, to connect the measuring and supply chambers for equalizing the air-pressure within the same, as set forth.

3. The supporting and adjusting screw *o*, in combination with the valve B having the measuring-chamber B′, and axial stem h, posts *m m′*, and cross-bar *n*, as described, for the purpose specified.

4. The combined standard and steam-induction pipe D, the steam-ports *d d′*, steam-tube *i*, and valve *j*, in combination with the measuring-valve B B′ and supply-cup A, as means for discharging the oil or grease from the measuring-chamber by steam pressure.

138,437.—*Recording-Instrument for Locomotives.*—JOHN D. RICHARDSON, Houston, Tex., assignor to himself, IRVIN C. LORD, and MILTON G. HOWE, same place. Application filed September 26, 1872.

The paper fillet or chart is moved or wound upon a drum geared in connection with an axle of the locomotive, and the recording-pencil is carried backward and forward at a uniform rate across the moving sheet by means of reversed screws alternately engaged, and rotated by clock-work. A second pencil, moved by the fluctuations of a steam-gager, records simultaneously on the same sheet the boiler-pressure at each particular point of the distance traveled.

Claim.—1. The combination of the rotating chart F, ruled transversely and longitudinally to indicate distance and time, and driven from the wheels of the car or locomotive at a definite rate, and a pencil, P, operated by a clock to continuously traverse back and forth across the path of the chart, substantially as and for the purpose specified.

2. The combination of rotating shaft F operating substantially as described, pencil P, screws U, lever T *d b*, plate W, and springs X X′, connected and operating substantially in the manner and for the purpose stated.

3. In combination with the elements of the preceding clause, the steam-gage Y and reciprocating pencil Z, as and for the purpose specified.

138,438.—*Carriage-Spring.*—JOHN D. RICHARDSON, Houston, Tex., assignor to himself and JOSEPH RICHARDSON, Cincinnati, Ohio. Application filed August 29, 1872.

The double concavo-convex form of the springs obviates the use of hinges, and the spring assumes a more rigid position as the strain increases.

Claim.—1. The combination of heads B B′ and double concavo-convex bent springs D D, constituting a spring which in use will elongate or straighten under a load, substantially as and for the purpose specified.

2. The combination of heads B B′ *d′*, side spring-plates D *d*, and hoops E E′, substantially as and for the purpose specified.

138,439.—*Magazine Fire-Arm.*—LOUIS C. RODIER and FRANCIS G. BATES, Springfield, Mass. Application filed March 27, 1873.

Claim.—1. The barrel A and a magazine or chamber in rear of the said barrel for supplying cartridges, in combination with the lever F, actuated by the finger-lever to transfer the cartridges from the magazine to the barrel, substantially as described.

2. In combination with the subject-matter of the first clause of the claim, the vertically-moving breech-block G, also actuated by the said finger-lever, substantially as described.

3. In combination with the vertically-moving breech-block G and lever E, the hammer I, hung forward of the said breech-block and adapted to be cocked by the successive operation of the lever and breech-block, substantially as described.

4. In combination with the barrel A, vertically-moving breech-block G, and lever F, the plate P, hinged to the frame in the rear of the barrel to cover and close the passage from the magazine to the arm, form a chute for the ejection, and guide for the insertion of a cartridge from the magazine, or by hand, substantially as set forth.

5. In an arm having the hammer hung forward of the breech-block, the double spring N, one part thereof operating as the main-spring and the other as a spring-sear, the combination being substantially as described.

6. In combination with the finger-lever and hammer, hung upon the same pivot, the trigger I, pivoted to the finger-lever, and extending up so as to release the hammer for discharge, substantially as specified.

138,440.—*Car-Starter.*—LOUIS C. RODIER and FRANCIS G. BATES, Springfield, Mass., assignors to themselves, RUFUS BAKER, Middletown, Conn., and WILLARD PARKER, New York, N. Y. Application filed April 3, 1873.

The arm, which is attached to the loose sleeve on the axle, has a cam-shaped hook, by which the pawl which engages lateral ly with the ratchet-wheel is thrown out of connection with the same when the lever is carried to that point where its power is spent.

Claim.—In combination with a toothed wheel, D, on the axle of a railway car, the lever E, carrying the pawl *e*, and the rod F for actuating the said lever, the cam-shaped arm L for withdrawing the pawl, substantially in the manner described.

138,441.—*Paraffine-Lamp.*—HENRY RYDER, Somerville, Mass. Application filed October 2, 1872.

The perforated wick-tube is inclosed in a guard or case projecting above the cap of the reservoir and extending nearly to its bottom. The guard is perforated to allow the liquid to reach the wick. In the upper part of the guard are small cups to contain paraffine and asbestus. When this is burned the paraffine on the wick is melted, and the wick may be readily lighted.

Claim.—1. The combination of the lighting cup or cups *g* with the wick-tube K, wick-guard L, and reservoir H, all being arranged as set forth.

2. The air-deflector *m′*, the wick-tube K, and the wick-guard L, arranged and connected as represented.

138,442.—*Shaft for Vehicles.*—BERNHARD SCHRÖDER, Newark, N. J. Application filed March 26, 1873.

The pole is made in two sections, which are connected by a hinge, the same being adapted to receive a rubber pad at its joint.

Claim.—The hinge-joint D, each part of which is provided with lips *d d* for confining in place the elastic pads *c*, in combination with a draft pole or shaft, made in two sections, *a b*, substantially as and for the purpose described.

138,443.—*Band Sawing-Machine.*—HENRY SILLMAN, Brooklyn, N. Y. Application filed June 14, 1872.

The driving-pulleys are connected with each other by means of a system of gearing so as to give a uniform speed to all the saws.

Claim.—1. The combination of the upper saw-shaft journal-boxes *c c*, made of two parts, one adjustable relatively to the other, as described, the adjusting-screws *e e*, worm-wheels *f*, shaft *g*, and endless screws *e e*, the whole arranged and operating substantially as described, for the purpose set forth.

2. The combination, with the saws, of bevel-wheels provided on the rear end of the lower pulley-shafts, and corresponding bevel-wheels capable of sliding on shafts geared together, one of which constitutes the driving-shaft, essentially as and for the purpose described.

138,444.—*Friction-Gear.*—FRANKLIN SIMMONS, New Orleans, La. Application filed October 16, 1872.

Friction-pulley having two faces, operated by a shifting friction-roller, which is brought in contact with either surface by a set-screw.

Claim.—The double friction-pulley D, small pulley or roller C, and set-screws E, when the same are combined and arranged substantially as described.

138,445.—*Thimble.*—WILLIAM P. SLENSBY, New York, N. Y. Application filed February 17, 1873.

A needle-threader is riveted to a thimble.

Claim.—1. The threader B, cast with projecting rivets *e* and *f f*, substantially as herein shown and described.

2. The thimble A, perforated as shown at *g g*, substantially as and for the purpose specified.

3. The combination of the perforated thimble A with the cast threader B having the pins *e f f*, and with the spring C, all arranged for connection with each other in manner set forth.

138,446.—*Spring Bed-Bottom.*—WILLIAM STARKE, Chicago, Ill. Application filed September 30, 1872.

The base of the coiled spring rests upon cross-bars. At the point it has eyes, which pass through transverse and longitudinal slats. Through the eyes a rod is inserted, which holds the springs in place, and passes down through the base-bar. The rod works free and acts as a guide and brace to prevent lateral motion.

Claim.—The combination of the longitudinal and transverse slats A B, spring I *d*, and rods D, which pass through the eyes, hold the slats A B together, bend down at the side, and pass through the lower section, and prevent the upper section from having a lateral motion, as and for the purpose set forth.

138,447.—*Corn-Knife.*—GEORGE STEPHENSON, Zionsville, Ind. Application filed March 8, 1873.

A blunt-edged hook is attached to the back of the blade, near its end. This serves to gather in the stalks, and also to raise them from the earth when trodden down.

Claim.—A corn-knife having a curved hook, C, formed on or attached to the back of the blade near the outer end, substantially as and for the purposes herein set forth.

138,448.—*Rotary Blower.*—JOHN A. SVEDBERG, Washington, D. C. Application filed February 18, 1873.

The blades of the blower are mounted so as to revolve eccentrically within and longitudinally of a cylindrical casing having induction and eduction air-ports. By the eccentric action the blades have imparted to them a reciprocal sliding movement within bearings formed in a drum having its axial center removed at a distance from the corresponding center of the cylindrical casing. The extremities of the blades, when in rotary motion, are in contact with the interior surface of the casing.

Claim.—1. In combination with the drum C, the bearing-support E revolving with it, and the stationary yoke E′, placed axially upon different center lines as bearings for the parts operating the blades of the blower, as set forth.

2. The drum C of the blower, having the bearing-support E revolving with said drum as a part thereof, in combination with the shaft or shafts D, fixed yoke and pin E′ *e*, and double crank F, substantially as herein specified.

3. The strips deepening the slots formed within and lengthwise of the drum, as intermediate bearings for the sliding blades, as specified.

4. The combination of the plates *g*, covering the ends of the slots, with the drum, as set forth.

5. In combination with the drum C, the rod or rods G and blades G′, the blades having their bearings in the deepened slots cut lengthwise with the drum, substantially as herein specified, for the purpose set forth.

6. In combination with the bearing-support E and bearings F″, the dovetailed slide F′ *f*, and piston-like rod G *f′*, and blades G′, substantially as and for the purposes set forth.

7. The pin *f′* of the rod G, and pin *f* of the slide F′, in combination with the double crank F, fixed pin *e*, and bearing-support E of the drum of the blower, substantially as and for the purpose specified.

138,449.—*Corpse-Preserver.*—PETER TALTAVULL, Washington, D. C., assignor to himself and EDWARD M. BOTELER, same place. Application filed June 1, 1871.

Claim.—In combination with an exterior case, constructed and operating as herein described, the ice-box D suspended therein, when said ice-box nearly fills or extends throughout the upper part of the case, has no contact with said upper part, except by the thin plates by which it is suspended, and is surrounded on all sides by the dead-air space *e*, as and for the purpose described.

138,450.—*Carpet-Stretcher.*—CHARLES TERRY, St. Louis, Mo., assignor of one-half his right to JAMES L. HICKOK, same place. Application filed April 2, 1873.

The device is constructed with a platform, having metallic curved points at one end and a block attached to a leather strap, which is confined to the lower side of the platform and passes over its end, by which the carpet, while in a partial upright position, and the carpet stretched by depressing it.

Claim.—The combination of the claw-lever A *a*, rib B, block C, and strap D, substantially as and for the purpose described.

138,451.—*Cultivator.*—CHRIST THEDE, Aledo, Ill. Application filed August 31, 1872.

An arched sectional axle connected by a bar or cross-piece holding the sections by screws and nuts. The ends of the main braces are connected to both axle and draft-pole by means of slotted plates, and the axle-sections turning loosely upon the cross-bar give a forward and back movement to each set of plows independently of the other so that the draft of each is borne by the horse attached to it.

Claim.—The combination of the laterally-adjustable axle-sections C and the threaded cross-piece B with the slotted pole-braces E, draft-pole A, and plow-frames G carrying the plows I^1 I^2, as shown and described.

138,452.—*Device for Adjusting the Elevating and Depressing Screws of Rolls.*—RICHARD H. THOMAS, Newport, Ky. Application filed December 7, 1872.

The horizontal shaft, connected by gearing with the adjusting-screws, is divided in the middle, and to one end is attached a worm-wheel, and to the adjacent end of the other part is fixed a frame, in which is situated a worm-shaft; by turning this shaft one of the screws is raised and the other lowered. For coarser adjustments one gear-wheel is loose, but can be connected to the shaft by a clutch sliding on a feather; when separated, only one screw is raised; when connected, both.

Claim.—1. In combination with the two screws E E', the two-part shaft I, worm-wheel L, and worm N, connected and operating substantially in the manner and for the purpose specified.

2. In combination with the shaft I, screws E E', and wheels G G' H H', the clutch Q, operating substantially as described, and for the purpose specified.

138,453.—*Gage for Circular-Saws.*—CHARLES J. ULMER, East Cambridge, Mass. Application filed April 2, 1873.

The gage is adjusted by means of a lever provided with a segmental gear acting upon a rack attached to the gage.

Claim.—The sliding gage and gear-bar *b*, lever *g*, segment *f*, tooth *l*, and notch-plate *i*, when constructed, combined, and relatively arranged, substantially as and for the purpose specified.

138,454.—*Card-Rack.*—HENRY R. VAN ETS, Peoria, Ill. Application filed February 26, 1873.

Claim.—A folding card-rack consisting of a net-work of wire, or of strips of metal, made in sections A and hinged together by loops or eyes *f* formed of the same piece of wire, the hinges or loops being continued vertically upward to form the tongues *a* to receive the cards, substantially as set forth.

138,455.—*Portable Electrical Apparatus.*—FREDERICK HENRY VARLEY, London, England. Application filed July 22, 1872.

A tube or rod of glass or other electric is provided with an enveloping rubber, which carries a small tubular Leyden jar having a wire loop for collecting the electricity excited by passing the rubber up and down the electric rod.

Claim.—The rod A, of glass or other dielectric substance, the rubber E, accumulator B, conductor D, chain C, and pin *d*, all arranged and combined for operation, as specified.

138,456.—*Device for Boring and Turning Gas-Fittings.*—MATHIAS WALTY, Buffalo, N. Y. Application filed February 26, 1873.

The device is applied to a lathe, and is connected to the feed-screw, by which a turning and boring tool clamped on an upper slide is fed forward through a train of gears. Below this slide is another, which, by means of a hand-screw, can adjust the whole device transversely. The fitting is rotated with the face-plate of the lathe, and these tools can be adjusted longitudinally in their seats, where they are held by set-screws.

Claim.—1. The combination, with the bottom rest B and transversely-adjustable top rest D, of the longitudinally-movable tool-holder E, when provided with the cylindrical socket *f* and rectangular recess *g*, for adapting the tool-holder to boring and turning, substantially as hereinbefore set forth.

2. The combination, with the feed-shaft *a* and pinion *k* and the screw-shaft *h* of the tool holder provided with gear-wheel *i*, of the pivoted arm M and wheels and pinions *m n o p* mounted thereon and driven from the feed-shaft, substantially as and for the purpose hereinbefore set forth.

3. The combination of the slotted segment P and set-screw *r* with the pivoted arm M, carrying the pinions *m n o p*, and slide E located upon a transversely-moving slide D, substantially as and for the purposes set forth.

138,457.—*Lounge and Bath-Tub Combined.*—CONRAD WENDEL, New York, N. Y. Application filed March 28, 1873.

The hinged cushion-frame is opened and shows a bath-tub suspended in the frame of the seat; a secondary hinged-cover also covers the bath-tub.

Claim.—The combination of a bath-tub with the frame and seat of a lounge, settee, or other article of a similar nature, the bath-tub adapted to be suspended, substantially in the manner herein shown and described.

138,458.—*Fertilizer.*—JAMES WHITEHILL, Frederick, Md. Application filed April 3, 1873.

Claim.—1. A barrel or other package of caustic lime ground to the sand state, as and for the purpose described.

2. The process of preparing unslaked lime by burning and grinding it for agricultural purposes, in the manner set forth.

138,459.—*Machine for Wiring and Binding Hats.*—HENRY A. WHITING, New York, N. Y. Application filed March 20, 1873.

The wire and brim-edge are laid in the bight of the adhesive braid, which is doubled by a folding-guide which directs these parts between rollers, where they are firmly pressed together.

Claim.—The shafts *a b*, having gear-wheels *c d* and pressing-rollers *e f*, constructed and arranged as described, in combination with each other, and with grooved abutment *i* and folding-gage *j*, as and for the purpose herein specified.

138,460.—*Boring Attachment to Lathes.*—FITZALLAN B. WILLIAMS, Sterling, Ill. Application filed January 24, 1873.

This device is to take the place of the tail-stock. The boring-spindle is rotated by a belt, and fed forward by another belt operating through gearing on a screw that passes through a nut in the end of the spindle.

Claim.—The combination of the bed-plate A with standards, boring-spindle C, sleeve *a*, nut *c*, screw G, countershafts *d h* with pulleys E I, respectively, and the gears D *b* and H *f*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

138,461.—*Tilting Chair.*—GEORGE C. WINCHESTER, Ashburnham, Mass. Application filed December 29, 1871.

The seat and stool are centrally pivoted together and are also connected by one or a pair of steel wires, each wire being securely fixed at one end in the stationary arm of one hinge, and, extending diagonally across to the other hinge, is fixed in the movable arm of the same.

Claim.—The combination, with the hinges C and D, of the steel wire or wires E, connecting the stationary arm *a* of one hinge with the movable arm *b* of the other, substantially as and for the purpose set forth.

138,462.—*Planing-Machine.*—JOSEPH P. WOODBURY, Boston, Mass. Application filed December 5, 1870.

A yielding presser-bar is used in place of the ordinary yielding pressure-roller.

Claim.—1. The combination of a rotary cutter and a yielding pressure bar or bars, substantially as and for the purpose described.

2. The combination of a solid bed and a yielding pressure bar or bars, for the purpose of holding down the material while being acted on by the cutter, substantially as set forth.

3. The combination of a solid bed, a rotary cutter, and a yielding pressure bar or bars, substantially as described.

4. The combination of the two pressure-bars, one of which is supported upon arms, and the other upon springs, substantially as and for the purpose set forth.

138,463.—*Plasterer's Head-Support.*—THOMAS T. WRIGHT, Fayetteville, N. C. Application filed March 22, 1873.

A head-rest for plasterers, stucco-workers, and all that class of artisans engaged in the fatiguing work of looking and operating overhead.

Claim.—The head-pad C, spring B, and adjusting-stem *a*, connected and provided with suitable fastening-straps, substantially as specified.

138,464.—*Railroad-Car Spittoon.*—HARRISON J. ZIMMERMAN, Hudson, Mich. Application filed March 15, 1873.

A metal and porcelain bowl with a hinged cover is attached to the side of the car, having a pipe extending down through the bottom.

Claim.—The spittoon B provided with the cover *b* and connecting with the pipe C for depositing the contents outside and below the car, the parts being made of metal and lined with porcelain, and attached to the panel of the car, substantially as and for the purpose shown and described.

REISSUE PATENTS.

5,377.—*Process of Transferring the Grain-Marks of Wood.*—JOHN R. CROSS, New York, N. Y., assignor to himself and ANDREW J. BASTINE.—Patent No. 128,468, dated July 2, 1872. Application filed April 1, 1873.

Employs a smooth elastic roller or curved surface to take up the grain-marks, natural or imitated, from a flat board properly colored and prepared, and transfer the same to other flat surfaces by rolling or pressure.

Claim.—1. A roller or curved surface with a smooth elastic surface, as a means of transferring configurations or designs, when employed in the manner described and set forth.

2. The process hereinbefore described of transferring configurations or designs.

5,378.—*Process and Apparatus for Stippling Metallic Surfaces.*—RICHARD DIMPS, New York, N. Y., assignor to TIFFANY & CO., same place.—Patent No. 128,290, dated June 25, 1872. Application filed April 2, 1873.

One or more punches of elastic wire points, loosely connected to a revolving chuck, are made to impinge against the metallic surface to be stippled, covering the same with fine indentations and producing a style of ornamentation known as satin or pearl finish.

Claim.—1. The process of stippling satin or pearl finishing, substantially as described.

2. One or more bunches of stippling-points loosely connected to a revolving chuck or mandrel, substantially as described.

3. The combination of one or more bunches of stippling-points with links loosely connecting said bunches to loops on the chuck or mandrel, substantially as described.

4. A metallic surface stippled or satin-finished, substantially as described.

5. The combination of the link *c*, cap *e*, and stippling-points *d*, substantially as described.

6. The chuck-head *b'*, carrying the loops *b*, substantially as described.

5,379.—*Stuffing for Mattresses.*—FREDERICK A. LANE, Cleveland, Ohio, assignor, by mesne assignments, to himself, LUTHER S. LANE, Swanzey, N. H., and EPHRAIM KENDALL, Cleveland, Ohio.—Patent No. 90,308, dated May 25, 1869; reissue No. 5,166, dated February 4, 1873. Application filed March 28, 1873.

The material is made from woolen fibers of refuse woolen goods and rags prepared by bunching and curling.

Claim.—1. As an improved article of manufacture for stuffing purposes, woolen fiber made from the refuse of woolen goods, rags, &c., by bunching and curling, as described.

2. The prepared homogeneous woolen fiber for stuffing bedding, upholstering, &c., when made from the waste of refuse woolen goods, rags, &c., and by separating the woven or interlocking fibers thereof and rendering them free and open, substantially as set forth.

5,380.—*Cot-Bed.*—LEANDER B. MORSE, Athol, Mass., assignor of one-half interest to LABAN MORSE.—Patent No. 135,573, dated February 4, 1873. Application filed March 29, 1873.

The cross-bars are attached to the longitudinal girders and the folding legs. In the upper side of the cross bars are pins; the slats are slotted to receive the pins, and a cleat holds them in place at the foot. A head-board is hinged to the top and acts as a cleat upon the slats at that end.

Claim.—1. A bed-frame consisting of the cross-bars A and A' and the girders or side pieces B B, provided with the legs D, and secured to said cross-bars in such a manner that, while they serve as stretchers to keep said bars the proper distance apart, they may be rotated for the purpose of folding the legs under the bed when not in use, substantially as described.

2. The combination of the slats C C provided with the slots *d d*, the cross-bar A having inserted in its upper side the pins *b b* to fit into said slots, and the holding-down cleat F, all constructed and arranged substantially as described.

3. In combination with the slats C C provided with slots *d d*, and the cross-bar A having inserted therein the pins *b b*, I claim the head-board G, hinged to the cross-bar A in such a manner that it may be placed in a perpendicular position or folded down onto the slats, and serve the purpose of holding the slats in position on the pins while they are free to move endwise thereon, substantially as described.

4. The cylindrical girders B B having the legs D secured therein and secured to the bed-frame by the straps *a*, whether said girders are arranged longitudinally or transversely of the frame, substantially as described.

5,381.—*Power-Hammer.*—JOSEPH PALMER, Concord, N. H.—Patent No. 122,647, dated January 9, 1872. Application filed April 11, 1873.

Claim.—1. The combination of the hammer *a*, spring S, and the crank, as and for the purpose set forth.

2. The combination of hammer *a*, spring S, connecting-rods *d* and *e*, and crank, as and for the purpose set forth.

5,382.—*Changeable-Gage Car-Truck.*—CHARLES D. TISDALE, Boston, Mass.—Patent No. 37,889, dated March 10, 1863. Application filed August 19, 1870.

The adjacent ends of the narrow and broad gage tracks are joined by intermediate rails; the wheels of the truck are secured to tubes, which allow the wheels to be adjusted to the different gages.

Claim.—1. In combination with the rails C C uniting the tracks A A and B B, the switch E E, substantially as shown and described.

2. In combination with the wheel-changing rails and switch, the extra broad-gage track-rail F, arranged and operating substantially as described.

3. A car, for running upon tracks of different gage, having in combination with rotary axles incapable of end movement, wheels sliding upon the axles, and the mechanism for locking the wheels in respective positions to run upon either a wide or narrow gage, substantially as described.

4. The peculiar wheel-locking mechanism, consisting of the two yokes G G, and the wheel-tubes made and applied to the axles substantially in the manner as hereinbefore specified.

5,383.—*Compound for Coating Roasted Coffee.*—JOHN T. COOKE, Brooklyn, N. Y.—Patent No. 131,852, dated October 1, 1872. Application filed April 8, 1873.

Claim.—1. Starch when used for coating coffee, substantially as and for the purposes set forth.

2. A compound of starch and gum arabic mixed together, substantially in the manner and proportions, and for the purposes specified.

3. A compound made of starch, gum arabic, and essence of coffee mixed together, substantially in the manner and proportions, and for the purposes described.

5,384.—*Pencil-Case.*—WILLIAM S. HICKS, New York, N. Y.—Patent No. 112,917, dated March 21, 1871. Application filed April 1, 1873.

A pencil-case the point of which is projected in withdrawing the lead by means of tubes, with reverse spiral slots sliding telescopically within one another, and having the outer shell fitted loosely on the barrel and held in position by a solid head and a screw-nut.

Claim.—1. An extension pencil-case having its outer shell A arranged to turn loosely on its body B, and independently of the other parts of the pencil or case, substantially as described.

2. The arrangement of the tubes *d* and *c* and the tubes *a* and *b*, the latter having reverse spiral slots, and all sliding telescopically within one another, as set forth.

3. In combination with the loose shell or casing A, the detachable or screw point C, whereby the outer shell can be applied or removed at will, and without soldering, substantially as herein set forth.

5,385.—*Treadle.*—GEORGE B. KIRKHAM, New York, N. Y.—Patent No. 136,603, dated March 11, 1873. Application filed April 3, 1873.

Foot-power to turn a fly-wheel constantly in the same direction, with noiseless and positive motion. The fly-wheel kept in motion by the alternate pressure of two bearing-arms, one above and one below; the bearing-arms attached to a pitman, operated in turn by the treadle; the pitman steadied by friction-clutches hinged to the treadle, which act as a shifting apparatus, and, by pressure against the pitman, increase the traction of the bearing-arms against the fly-wheel. Applicable to sewing-machines, jig-saws, hand-lathes, and the like.

Claim.—1. The arrangement of the bearing-arms B B' at an angle to the pitman C and the set-screws *a a*, substantially as and for the purpose hereinafter set forth.

2. The combination of friction-clutches F F G and H I J K with the pitman and treadle, substantially as and for the purpose hereinbefore set forth.

3. The arrangement of the curved arms B B', set-screws *b b*, and double pitman C C', substantially as and for the purpose hereinbefore set forth.

4. The arrangement of the two halves of the wheel A A', disks *c c*, screws *d d* with grooves, bevels, curved or flat surfaces to the arms B B' and wheel A A', substantially as and for purpose hereinbefore set forth.

5,386.—*Grab-Tool for Oil-Wells.*—JAMES H. LUTHER, Petroleum Centre, Pa.—Patent No. 56,961, dated August 7, 1866. Application filed January 14, 1873.

A hollow wrought-iron cylinder or tube, with seats formed on its inside, extending in the direction of its length, milled entirely through the thickness of the tube at its lower end, with bevel or inclined faces. Fitted to these faces are the grabs, connected to a common loose ring or collar by thin metallic bands, the collar upon the outside or stem of the tube, near its upper end, and resting on projecting pins of the same. Between this collar and the shoulder of the tube a spiral spring is coiled, by which means the collar is held to its seat on the pins. The inner faces of the grabs are serrated to prevent them from slipping when set upon the tool which they are to remove.

Claim.—1. In a tool for extracting articles from oil-wells, the wedge-shaped grab, in combination with and operated by an inclined seat, in the manner described.

2. The combination of the grabs B, the stripe *c c*, and ring D, constructed and operating as described.

3. The combination of the wedge-shaped grabs B, having inclined and rounded backs, as shown, with the inclined and rounded seats *a a*, milled or turned in or through the sides of the cylinder *b*, as specified and shown.

5,387.—*Hatchway.*—JAMES D. SINCLAIR, Brooklyn, N. Y., assignor, by mesne assignments, to EDWARD A. LAMBERT, WILLIAM S. HARRIS, and NICHOLAS B. RHODES, same place.—Patent No. 84,387, dated November 24, 1868. Application filed April 3, 1873.

The hatches can be opened in succession from the top downward by a person pulling on the rope. A series of hooks retain the hatches when opened, and by pulling the cord all the hooks can be lifted and the hatches allowed to fall in place.

Claim.—1. The combination of the hatches B F D with the system of pulleys *a b* and the cord or chain H, substantially as and for the purpose set forth.

2. The combination of a series or tier of hatches, B D F, with the series of hooks or latches *d d* and the cord *e*, substantially as and for the purpose described.

3. The apparatus as a whole, consisting of the hatches B D F, provided with the system of pulleys *a b* and the cord or chain H, and the series of hooks or latches *d d*, and the cord *e*, substantially as and for the purposes described.

5,388.—*Sewing-Machine.*—EARLE H. SMITH, Bergen Heights, N. J.—Patent No. 18,605, dated November 10, 1857; extended seven years. Application filed January 29, 1872.

The needle-thread detainer and cast-off is arranged on the body of the rotating shuttle, and it receives and holds the thread during a portion of the shuttle's movement, and then casts it off.

Claim.—1. The combination, with the shuttle, of a revolving needle-thread detainer and cast off to receive, control, and deliver loops of needle thread from and to the shuttle, substantially in the manner described and specified.

2. The combination, with a reciprocating needle, of a revolving shuttle, thread-detainer, and cast-off, constructed and operating substantially in the manner described and specified.

3. A reciprocating needle operated by a continuous rotary movement, a rotary shuttle, a rotary thread-controller, (constructed as described,) and a feeding-dog, operated by a circular cam, all combined and arranged in co-operative relation with each other and producing a noiseless sewing-machine, substantially in the manner described and specified.

5,389.—*Plaster for Walls.*—BENJAMIN R. SMITH and JOHN C. HARRIS, Philadelphia, Pa.—Patent No. 111,267, dated January 24, 1871. Application filed March 16, 1873.

Dried and powdered hydrate of lime is mixed with crude ground plaster or gypsum, and the mixture calcined, or the dry hydrate of lime is mixed with plaster already calcined. This compound may be mixed with any coloring matter, found best adapted, at any stage of the process, and the figments must be so mingled that there is perfect uniformity of tint throughout the whole mass.

Claim.—1. The compound plaster produced of the materials and in the manner substantially as above set forth.

2. A homogeneous tinted plaster, adapted for coating walls or ceilings, substantially as described.

3. The process hereinbefore described of mixing lime, gypsum, and coloring-matter, to produce a tinted plaster.

5,390.—*Brick-Machine.*—ROBERT A. SMITH, Newburyport, Mass. Patent No. 128,822, dated July 9, 1872. Application filed March 29, 1873.

Having shaft-adjusting mechanism, steel-faced mold-wheel provided with flanges, and having Babbitt-metal-lined receiving-chambers, an auxiliary cut-off combined with the main cut-off, a brick-discharger pivoted at its lower parts and sliding in vertical grooves; the follower H having its packing-plate *k* made of Babbitt metal.

Claim.—1. The pug-mill shaft-adjusting mechanism, viz., the screw-rods L L, nuts, and cross-bar I, combined and arranged with the pug-mill and the supporting-frame thereof, as set forth.

2. The mold-wheel, as provided with the Babbitted receiving-chambers *h* and steel cap-plate G arranged with it, as set forth.

3. The auxiliary "cut-off" *q* and its discharging-throat *z* arranged and combined with the main cut-off *p*, the rotary mold-wheel A, and the pug-mill F, all being substantially as described.

4. The presser-spring *v* and adjusting-screws *t* arranged and combined with the main and auxiliary cut-offs, substantially as set forth.

5. The brick-discharger H pivoted at its lower parts to a bar or carrier, *g'*, arranged to slide in vertical slots or guides *h' h'*, whereby the follower is allowed to vibrate more or less to accommodate it to the mold while rising or falling therein.

6. The follower H made with the packing-plate *k*, of anti-friction or Babbitt metal, and the cap-plate *l* arranged and combined with it, as described.

7. The combination of the abutment with the mold-wheel provided with the flange or shoulder, all being essentially as and for the purpose as explained.

INDEX OF INVENTIONS PATENTED APRIL 29, 1873.

[The numbers in parentheses denote the classification of patents.]

Air brake, steam power, (122,) H. L. McAvoy 138,339
Atomizer bulb, (98,) H. D. Lockwood 138,416
Awning frame, window, (31,) J. A. Allen 138,223
Axle boxes, gage for setting, (31,) T. Scott 138,347
Bed bottom, (69,) M. A. Hunt 138,252
Bed bottom, spring, (62,) E. G. Sherman 138,348
Bed bottom, spring, (92,) W. Starke 138,446
Bed, cot, (62,) L. B. Morse, (reissue) 5,380
Billiard cushion, (143,) H. A. Alden 138,356
Bird cage, (170,) G. Günther 138,396
Blower, rotary, (12,) J. A. Svedberg 138,418
Boat detaching apparatus, (13,) C. A. Enell 138,386
Boat, life, (13,) E. A. Barrett 138,225
Boiler, wash, (136,) J. Reinig 138,285
Boilers, composition for covering steam, (148,) J. M. Allison 138,358
Bolt, door, (93,) S. D. Arnold 138,360
Book case, revolving, (62,) L. B. Pert 138,279
Boot and shoe shave, (16,) D. Harrington 138,328
Bottle filling apparatus, (1,) J. Matthews 138,421
Bottle for effervescing liquids, (1,) H. Codd 138,230
Bottles, mold for glass, (68,) C. D. Fox 138,323
Box, work, (38,) W. Brace 138,372
Bracket, (62,) L. Benecke 138,367
Brick machine, (20,) Hotchkiss and Wolliston 138,251
Brick machine, (20,) R. A. Smith, (reissue) 5,390
Brush, blacking, (22,) Von Kessler and Mendenwald 138,353
Brush handles, machine for driving, (22,) P. Peartree 138,344
Buckle, harness, (72,) J. L. Selleck 138,291
Calculating machine, (42,) G. B. Grant 138,246
Candle mold tip, (26,) I. Cole 138,380
Car axle box, (122,) S. F. Gates 138,242
Car axle box, (122,) W. J. Manker 138,285
Car coupling, (122,) E. H. Janney 138,405
Car, dumping, (121) O. M. Avery 138,361
Car replacer, (120,) J. T. Baxter 138,311
Car spittoon railroad, (63) H. J. Zimmerman 138,464
Car spring, (31,) J. B. Quirk 138,433
Car starter, (122,) T. Cooper 138,233
Car starter, (122,) Rodier and Bates 138,440
Car truck, changeable gage, (120,) C. D. Tisdale, (reissue) 5,382
Cars, folding seat for street railway, (122,) K. Egan 138,321
Carbureting air, apparatus for, (27,) Judd and Doty 138,409
Card rack, (146,) H. R. Van Epe 138,454
Carpet stretcher, (62,) P. Kelly 138,333
Carpet stretcher, (62,) C. Terry 138,450
Carriage, glass mold, (68,) Bennett, Krebs, and Haley 138,308
Carriage spring, (31,) C. F. Hall 138,247
Carriage spring, (31,) J. D. Richardson 138,439
Carriages, king bolt for perch, (31,) J. L. H. Mosier 138,342
Cartridges, machine for loading, (32,) T. L. Sturtevant 138,294
Cattle blinder, (72,) M. Backmayr 138,224
Chain links, machine for making ornamental, (86,) E. L. Levavasseur 138,413
Chair, tilting, (62,) G. C. Winchester 138,461
Churn, rotary, (45,) F. E. Clarkson 138,229
Coal screen, (3,) S. W. Woodward 138,355
Coffee, compound for coating roasted, (88,) J. T. Cooke, (reissue) 5,383
Cooler, beer, (19,) F. Schmitt 138,289
Cooling rooms, &c., apparatus for, (58,) T. D. Kingan 138,411
Corn crib, (159,) Hughes and Mapes 138,332
Corpse preserver, (39,) P. Taltavull 138,449
Cotton chopper, (43,) Bailey and Bagby 138,363
Cradle, (62,) W. T. Doremus 138,320
Cultivator, (43,) C. Thede 138,451
Dental clamp, (46,) C. E. Blake 138,370
Dental engine, (46,) C. M. Curtis 138,318
Doors, threshold for, (30,) O. G. Thomas 138,300
Dredger, (82) A. C. Both 138,227
Dredger, (82,) T. Symonds 138,295
Dress facing, (38,) W. H. Gallup 138,326
Dry goods stand, (54,) J. J. Bisel 138,226
Electrical apparatus, portable, (50,) F. H. Varley 138,455
Electro-magnetic indication coil, (50,) J. S. Camacho 138,316
Elevator, (79,) Mageeau and Marks 138,337
Elevator, water, (118,) T. Bell 138,312
Engine governor, marine steam, (69,) O. Marland 138,4 0
Engine lubricator, steam, (87,) W. R. Patterson 138,343
Engine, rotary steam, (150,) J. Lucas 138,334
Engine, rotary steam, (150,) W. C. Stiles 138,352
Fan, automatic, (165,) Reichhardt and Schnapp 138,345
Feather renovator, (62,) W. S. Groff 138,327
Fertilizer, (96,) S. Whitehill 138,458
Fertilizer distributer, (133,) D. F. Halliburton 138,398
File, (53,) J. B. Johnson 138,256
File, prescription, (146,) A. D. Foster 138,390
Fire arm, magazine, (12,) Rodier and Bates 138,439
Fire escape, (79,) W. Kegg 138 410
Fire kindling composition, (61,) J. C. Crumpton 138,382
Fork, horse hay, (77,) L. Harverstick 138,240
Fork, horse hay, (77,) T. Rhoads 138,286
Furnace for smelting ores, (85,) J. Neville 138,423
Furnace for making wrought iron direct from the ore, puddling, (85,) J. Neville 138,429
Furniture polish, (107,) C. A. Libby 138,262
Gas apparatus, (66,) Brown and West 138,377
Gas fittings, boring and turning, (64,) M. Waltz 138,456
Gate, automatic, (52,) L. Filson 138,238
Gate, automatic, (52,) J. P. Ponce 138,283
Gear, friction, (67,) F. Simmons 138,444
Generator, steam, (140,) J. H. Mills 138,269
Hammer, power, (60,) J. Palmer, (reissue) 5,381
Harvester knives, tempering, (74,) J. F. Shippey 138,349
Hat, (76,) J. O'Donnell 138,430
Hat wiring and binding machine, (76,) H. A. Whiting 138,459
Hatchway, (30,) J. D. Sinclair, (reissue) 5,387
Heel rands, machine for turning, (16,) Johnson and Moulton 138,257
Hinge, (24,) P. P. Lynch 138,336
Horse collar lining, (72,) D. Curtis 138,383
Inhaler, (156,) Hunter and Woods 138,253
Iron front for stone piers, (22,) J. Abbott 138,222
Ironing board, (91,) R. N. Herring 138,331
Joiner, universal, (173,) Raynard and Hatch 138,284
Key fastener, (93,) W. Neracher 138,272
Knife, corn, (44,) G. Stevenson 138,447
Knife, saw, and spring scale combined, (25,) J. Bagge 138,362
Ladder, extension step, (30,) L. B. Covert 138,234
Ladder, fire escape, (30,) C. H. White 138,304
Lamp filler, (90,) H. H. V. Lilley 138,415
Lamp, magnesium, (90,) L. S. and H. R. Russell 138,346
Lamp, paraffine, (90,) H. Ryder 138,441
Lantern, (90,) Connor and Hynes 138,232
Lathe boring attachment, (100,) F. B. Williams 138,460
Lathe dog, (100,) C. L. Wickham 138,303
Lathe for turning bubs, (172,) Wagner and Fry 138,305

Light house, floating, (137,) J. B. Stoner 138,292
Light house, floating, (173,) J. B. Stoner 138,293
Locomotive head light, (90,) L. Michaels 138,426
Locomotive recording instrument, (42,) J. D. Richardson 138,437
Log turner, (130,) J. C. Moore 138,276
Loom let off mechanism, (95,) Gahren and Langlotz 138,391
Lounge and bath tub combined, (62,) C. Wendel 138,457
Lubricator, (87,) J. Gates 138,243
Lubricator, (87,) W. Morris 138,341
Lubricator, (87,) J. A. Oesenbrück 138,274
Lubricator, (87,) H. W. Regan 138,436
Lumber measure, (42,) F. S. Baldwin 138,310
Malt kilns, stirrer for, (19,) E. Schmidt 138,288
Match safe, (90,) C. H. Leggett 138,261
Mattress stuffing, (62,) F. A. Lane (reissue) 5,379
Mechanical movement, (67,) C. Meiners 138,424
Medical compound, (98,) J. Benda 138,313
Medical compound, (98,) G. Lucy 138,335
Medical compound, (98,) Phillips and Reid 138,362
Metal, apparatus for separating, (3,) E. J. Peet 138,276
Metallic surfaces, stippling, (54,) R. Dimes, (reissue) 5,378
Mill, foaming, (150,) J. W. Johnson 138,407
Mill feed regulator, grinding, (58,) J. C. Dunlap 138,384
Milling machine, (100,) B. Lawrence 138,260
Mitten, (38,) F. L. Oakley 138,273
Musical wind instrument, (102,) I. Fiske 138,369
Needle making machine, (104,) F. W. Mallett 138,419
Nut lock, (14,) L. J. Miller 138,268
Paper, (108,) H. E. Wagner 138,302
Pencil case, (146,) W. S. Hicks, (reissue) 5,384
Petroleum, refining, (56,) A. Farrar 138,237
Photographic plate holder, (111,) H. T. Anthony 138,359
Photographic plate holder, (111,) W. Lewis 138,414
Piers, iron front for stone, (22,) J. Abbott 138,222
Pin hinge, (34,) Lyons and Abrahams 138,416
Planchets of sheet metal, machine for cutting out, (119,) J. Lowe 138,264
Planing machine, (173,) L. Gould 138,244
Planing machine, (173,) J. P. Woodbury 138,402
Planter, corn, (133,) L. Lacey 138,259
Planter, hand corn, (133,) H. Gortner 138,392
Plaster for walls, (153,) Smith and Harris, (reissue) 5,389
Plasterer's head support, (4,) T. T. Wright 138,463
Platform, dumping, (31,) W. W. Hinman 138,400
Plow handle, (114,) J. T. Raftery 138,434
Plow, wheel, (114,) F. Hasbrook 138,329
Press, (7,) E. B. Platt 138,432
Press, hydraulic wheel, (118,) G. A. Gray, Jr 138,393
Press, lever cider, (19,) H. Peters 138,280
Pruning shears, (63,) M. C. Malone 138,338
Pruning shears, (63,) W. McCray 138,340
Pulleys, machine for turning, (100,) G. A. Gray, Jr 138,394
Pulverizing soil, machine for, (73,) A. C. Tower 138,301
Pyroxyline articles, manufacturing, (35,) J. W. Hyatt 138,254
Quilting frame, (38,) R. Blackstone 138,369
Railroad cattle guard, (120,) R. M. Yorks 138,308
Reflector, (90,) C. F. Jacobsen 138,255
Refrigerator, (88,) J. J. Bailey 138,364
Refrigerator building, (58,) W. M. Mixer 138,427
Regulator for grinding mills, feed for, (58,) J. C. Dunlap 138,384
Rock and ore crusher, (3,) C. Forster 138,240
Row lock, (13,) T. Fearon 138,388
Sash holder, (24,) E. Knapp 138,258
Saw gage, circular, (130,) C. J. Ubner 138 453
Saw gumming machine, (131,) K. Weinberger 138,354
Saw set, (131,) J. G. Tattershall 138,297
Saw teeth, (131,) J. E. Emerson 138,236
Sawing machine, band, (130,) H. Stillman 138,443
Scale, bag holder weighing, (132,) Budge and Russell 138,315
Screw and nut, (14,) S. J. Peet 138,277
Screw forming machine, (136,) W. A. McCool 138,422
Screw rod, (67,) S. J. Peet 138,278
Screws of rolls, adjusting the elevating and depressing, (125,) R. H. Thomas 138,452
Scrubber, (22,) I. J. Emory 138,322
Seeder, broadcast, (133,) J. D. Huffman 138,403
Separator, middlings, (57,) H. P. Jones 138,408
Sewage, treatment of, (96,) F. Hillé 138,250
Sewing machine, (134,) D. H. Coles 138,381
Sewing machine, (134,) E. H. Smith, (reissue) 5,388
Sewing machine cabinet, (134,) G. Range 138,435
Sewing machine folding guide, (134,) S. W. Wood 138,306
Sewing machine hemmer, (134,) E. Booth 138,371
Sewing machine covers, binder for, (134,) E. F. French 138,324
Sewing machine quilting attachment, (134,) W. H. Heffley 138,399
Sewing machine thread cutter, (134,) A. M. Leslie 138,412
Shaft for vehicles, (31,) B. Schroder 138,442
Shingling bracket, (30,) L. W. Merriam 138,425
Snuff, apparatus for packing, (160,) A. H. Pflock 138,281
Splints, machine for cutting, (173,) C. P. and C. D. Clarke 138,378
Stereotype plate holder, (117,) F. Scholefield 138,290
Stock feeder, portable, (144,) J. M. Spencer 138,351
Stone, doublet, (86,) S. Bruhl 138,314
Stool, store, (62,) A. A. Murphy 138,271
Stove pipe shelf, (154,) W. B. Elliott 138,385
Stud, shirt, (33,) O. S. Thayer 138,299
Syringe, fountain, (156,) H. D. Lockwood 138,417
Table, (62,) H. W. Pearsall 138,431
Table, auxiliary, (62,) E. Johnson 138,406
Table leaf support, (62,) Abbott and Gibson 138,309
Thimble, (38,) W. P. Slensley 138,445
Thrashing and hulling clover, machine for, (159,) I. T. Barton 138,366
Tire bending machine, (60,) F. E. Coleman 138,331
Tool handle, (175,) W. H. McCoy 138,433
Torpedo, self-tamping, (194,) S. A. Briggs 138,373
Toy, (143,) C. Ball 138,365
Toy, (143,) Hubbard and Severance 138,401
Trap, animal, (143,) D. J. Owen 138,275
Treadle, (67,) G. B. Kirkham, (reissue) 5,385
Turbine wheel, (168,) D. B. Flint 138,239
Tuyere, (12,) G. Harach 138,248
Type, distributing, (117,) M. Gally 138,241
Vacuum pan, (155,) A. P. Brown 138,375
Valve, balanced, (150,) A. N. Hadley 138,397
Valve, balanced slide, (152,) A. O. Frick 138,393
Valve, slide, (152,) J. L. Brown 138,376
Vehicles, sign for moving, (54,) Clark and Lilliendahl 138,228
Veneers, perfecting, (144,) A. H. Allen 138,357
Vessel for containing liquids under pressure, (107,) S. Marks 138,2 6
Wagon axle lubricator, (87,) W. Loewenstein 138,263
Wagon, dumping, (133,) O. Gunpuldson 138,395
Wagon, dumping, (133,) D. E. Haines 138,248
Wagon standard, (31,) J. L. Hudson 138,402
Washer, ore, (3,) T. Wren 138,307
Washing machine, (91,) Brooks and Hartsell 138,374
Washing machine, (91,) G. J. Colby 138,379
Washing machine, (91,) H. Dexter 138,319
Washing machine, (91,) E. Dickermann 138,235
Washing machine, (91,) G. W. Fagaines 138,387
Washing machine, (91,) D. W. Helfrich 138,330
Washing machine, (91,) J. Taber 138,296
Watches, winding click for, (36,) S. C. Smith 138,350
Water closet, (8,) P. C. Rowe 138,287
Water closet bowls, ventilating, (8,) J. V. Mathivet 138,267
Wells, grab tool for oil, (124,) J. H. Luther, (reissue) 5,386
Wheel, traction, (94,) O. Hyde 138,404
Wire and rope, stretching tool for, (59,) R. L. Taylor 138,298
Wire brush, coiled, (170,) J. B. Christoffel 138,317
Wood, transferring the grain marks of, (107,) J. R. Cross, (reissue) 5,377

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED APRIL 29, 1873.

Abbott, E. L., and S. T. Gibson, Table leaf support 138,309
Abbott, J., Iron front for stone piers 138,222
Abrahams and Lyons 178,416
Albert Field Tack Company, assignee 138,264
Alden, H. A., Billiard cushion 138,356
Allen, A. H., Perfecting veneers 138,357
Allen, J. A., Frame for window awnings 138,223
Allison, J. M., Composition for covering steam boilers 138,358
Ames, J., assignee 138,344
Anthony, H. T., Photographic plate holder 138,359
Arnold, S. D., Door bolt 138,360
Avery, O. M., Dumping car 138,361
Backmayr, M., Blinder for cattle 138,224
Bagby and Bailey 138,363
Bagge, J., Butcher's combined knife, saw, and spring scale 138,362
Bailey, C., and G. K. Bagby, Cotton chopper 138,363
Bailey, J. J., Refrigerator 138,364
Baker, R., assignee 138,440
Baldwin, F. S., Lumber measure 138,310
Ball, C., Toy 138,365
Barrett, E. A., Life boat 138,225
Barrett, R., assignee 138,230
Barton, I. T., Machine for thrashing and hulling clover 138,366
Bastine, A. J., assignee, (reissue) 5,377
Bates and Rodier 138,439, 138,440
Baxter, J. T., Car replacer 138,311
Beardsley, J. H., assignee 138,238
Beggs, C. C., & Co., assignees 138,380
Bell, T., Water elevator 138,312
Benda, J., Medical compound 138,313
Benecke, L., Bracelet 138,367
Bennett, D., M. Krebs, and J. Haley, Glass mold carriage 138,368
Bisel, J. J., Dry goods stand 138,226
Blackstone, R., Quilting frame 138,369
Blake, C. E., Clamp for dental purposes 138,370
Booth, E., Sewing machine hemmer 138,371
Boteler, E. M., assignee 138,449
Booth, A. C., Dredger 138,227
Brace, W., Work box 138,372
Brewster & Co., assignees 138,342
Briggs, S. A., Self-tamping torpedo 138,373
Brooks, W. P., and J. D. Hartzell, Washing machine 138,374
Brown, A. P., Vacuum pan 138,375
Brown, J. L., Slide valve 138,376
Brown, J. W., and J. H. B. West, Gas apparatus 138,377
Bruhl, S., Doublet stone 138,314
Budge, H. T., and N. W. Russell, Bag holder weighing scale 138,315
Camacho, J. S., Electro magnetic induction coil 138,316
Christoffel, J. B., Coiled wire brush 138,317
Clark, C. P., and C. D., Machine for cutting splints 138,378
Clark, E. Y., and W. A. Lillieadahl, Sign for moving vehicles 138,228
Clarkson, F. E., Rotary churn 138,229
Codd, H., Bottle for effervescing liquids 138,230
Cohn, M., assignee 138,269

Colby, G. J., Washing machine 138,379
Cole, I., Candle mold tip 138,380
Coleman, F. E., Tire bending machine 138,231
Coles, D. H., Sewing machine 138,381
Colsten, H. V., assignee 138,371
Connor, J. P., and M. T. Haynes, Lantern 138,232
Cooke, J. T., Compound for coating roasted coffee, (reissue) 5,383
Cooper, T., Car starter 138,233
Corbin, P. and F., assignees 138,360
Covert, L. B., Extension step ladder 138,234
Cross, J. R., Transferring the grain marks of wood, (reissue) 5,377
Crumpton, J. C., Composition for kindling fires 138,392
Crystal Glass Company, assignee 138,368
Curtis, C. M., Dental engine 138,318
Curtis, D., Horse collar lining 138,383
Curtis, F., assignee 138,350
Dexter, H., Washing machine 138,319
Dickerman, E., Washing machine 138,235
Dimes, R., Stippling metallic surfaces, (reissue) 5,378
Doremus, W. T., Cradle 138,320
Doty and Judd 138,409
Dunlap, J. C., Feed regulator for grinding mills 138,384
Egan, K., Folding seat for railway cars 138,321
Elliott, W. B., Stove pipe shelf 138,385
Emerson, J. E., Saw teeth 138,236
Emery, L. J., Scrubber 138,322
Enell, C. A., Boat detaching apparatus 138,386
Fagaines, G. W., Washing machine 138,387
Farrar, A., Refining petroleum 138,237
Fearon, T., Row lock 138,388
Filson, L., Automatic gate 138,238
Fiske, I., Musical wind instrument 138,389
Flint, D. B., Turbine wheel 138,239
Forster, C., Rock and ore crusher 138,240
Foster, A. D., Prescription file 138,390
Fox, C. D., Mold for glass bottles 138,323
French, E. F., Binding for sewing machine covers 138,324
Frick, A. O., Balanced slide valve 138,325
Fry and Wagner 138,303
Gahren, C., and L. Langlotz, Let off mechanism for looms 138,391
Gallup, W. H., Dress facing 138,326
Gally, M., Machine for distributing type 138,241
Gates, J., Lubricator 138,243
Gates, S. F., Car axle box 138,242
Gibbs, J., assignee 138,400
Gibson and Abbott 138,309
Gortner, H., Hand corn planter 138,392
Gould, L., Planing machine 138,244
Grant, G. B., Calculating machine 138,245
Gray, G. A., Jr., Hydraulic wheel press 138,393
Gray, G. A., Jr., Machine for turning pulleys 138,394
Greff, W. S., Feather renovator 138,327
Gunnildson, O., Dumping wagon 138,395
Gunther, G., Bird cage 138,396
Hadley, A. N., Balanced valve 138,397
Haines, D. E., Dumping wagon 138,246
Haley, Bennett, and Krebs 138,368
Hall, C. F., Carriage spring 138,247
Halliburton, D. F., Fertilizer distributer 138,398
Harrington, D., Boot and shoe shave 138,328
Harris and Smith, (reissue) 5,389
Harris, W. S., assignee, (reissue) 5,387
Harsch, G., Tuyere 138,248
Hartsell and Brooks 138,374
Hasbrook, F., Wheel plow 138,329
Hatch and Raynard 138,284
Haverstick, L., Horse hay fork 138,249
Heffley, W. H., Quilting attachment for sewing machines 138,399
Helfrick, D. W., Washing machine 138,330
Herring, R. N., Ironing board 138,331
Hickok, J. L., assignee 138,450
Hicks, W. S., Pencil case, (reissue) 5,384
Hillé, F., Treatment of sewage 138,250
Hinman, W. W., Dumping platform 138,400
Holihan, T., assignee 138,428, 138,429
Hotchkiss, J., and P. N. Wollston, Brick machine 138,251
Howe, M. G., assignee 138,437
Hubbard, F., and E. B. Severance, Toy 138,401
Hudson, J. L., Wagon standard 138,402
Huffman, J. D., Broadcast seeder 138,403
Hughes, J. M., and A. J. Mapes, Corn crib 138,332
Hunt, M. A., Bed bottom 138,252
Hunter, C. D., and E. S. Woods, Inhaler 138,253
Hunter, S. B., assignee 138,400
Hyatt, J. W., Manufacturnig pyroxyline articles 138,254
Hyde, O., Traction wheel 138,404
Hynes and Connor 138,292
Jacobsen, C. F., Reflector 138,255
Janney, E. H., Car coupling 138,405
Johnson, E., Auxiliary table 138,406
Johnson, J. B., File 138,256
Johnson, J. B., and G. W. Moulton, Machine for turning heel roads 138,257
Johnson, J. W., Fanning mill 138,407
Jones, H. P., Middlings separator 138,408
Judd, T., and E. Doty, apparatus for carbureting air 138,409
Kegg, W., Fire escape 138,410
Kelly, P., Carpet stretcher 138,333
Kendall, E., assignee, (reissue) 5,379
Kenrick, A., assignee 138,347
Kingan, T. D., Apparatus for cooling rooms, &c 138,411
Kirkham, G. B., Treadle, (reissue) 5,385
Knapp, E., Sash holder 138,258
Krebs, Haley, and Bennett 138,368
Lacey, L., Corn planter 138,259
Lambert, E. A., assignee, (reissue) 5,387
Lane, F. A., Stuffing for mattresses, (reissue) 5,379
Langlotz and Gahren 138,391
Lawrence, B., Milling machine 138,260
Leggett, C. H., Match safe 138,261
Leslie, A. M., Sewing machine thread cutter 138,412
Levavasseur, E. L., Machine for making links for ornamental chains 138,413
Lewis, W., Photographic plate holder 138,414
Libby, C. A., Furniture polish 138,262
Lilley, H. V., Lamp filler 138,415
Lilliendahl and Clark 138,228
Lockwood, H. D., Atomizer bulb 138,416
Lockwood, H. D., Fountain syringe 138,417
Loewenstein, W., Wagon axle lubricator 138,263
Lord, I. C., assignee 138,437
Lowe, J., Machine for cutting out planchets of sheet metal 138,264
Lucas, J., Rotary steam engine 138,334
Lucy, G., Medical compound 138,335
Luther, J. H., Grab tool for oil wells, (reissue) 5,386
Lynch, P. P., Hinge 138,336
Lyons, A., and I. B. Abrahams, Pin hinge 138,418
Mageean, M., and G. W. Marks, Elevator 138,337
Mallett, F. W., Machine for making needles 138,419
Malone, M. C., Pruning shears 138,338
Manker, W. J., Car axle box 138,265
Mapes and Hughes 138,332
Marks and Mageean 138,337
Marks, S., Vessel for containing liquids under pressure 138,266
Marland, O., Marine steam engine governor 138,420
Marriott, T., assignee 138,365
Mathivet, J. V., Ventilating water closet bowls 138,267
Matthews, J., Apparatus for filling bottles 138,421
Mattullath, J. F. H., assignee 138,302
McAvoy, H. L., Steam power air brake 138,339
McCool, W. A., Screw forming machine 138,422
McCoy, W. H., Tool handle 138,423
McCray, W., Pruning shears 138,340
McKellip, W. A., assignee 138,311
Meiners, C., Mechanical movement 138,424
Mendenwald and Kessler 138,353
Merriam Manufacturing Company, assignee 138,401
Merriam, L. W., Shingling bracket 138,425
Michaels, L., Locomotive head light 138,426
Miller and Ponce 138,283
Miller, L. J., Nut lock 138,268
Mills, J. H., Steam generator 138,269
Mitchell, C. A., assignee 138,399
Mixer, W. M., Refrigerator building 138,427
Moore, J. C., Log turner 138,270
Morris, W., Lubricator 138,341

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks).....	6,500
SEWING-MACHINES and attachments.....	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c.....	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs.....	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 200 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

COMMISSIONER'S DECISIONS.

THE AMERICAN SARDINE COMPANY.—*Appeal.*

[*Appeal from the decision of the Examiner of Trade-Marks in the matter of the application of the American Sardine Company for the registration of a Trade-Mark.—Decided May* 13, 1873.]

Registration refused to the phrase "American Sardines," intended to be placed as a trade-mark on cases resembling sardine-boxes, but containing another kind of fish, it being calculated to deceive the public.

The phrase "American Sardines" is not one coined for the intended use, but would be the proper name of such fish if they should be found in this country, and ought not therefore to be appropriated as a trade-mark.

LEGGETT, *Commissioner:*

Applicants seek to have the words "American Sardines" registered as their trade-mark, to be applied upon boxes containing a preparation of fish of the herring family, to which Mediterranean sardines belong, known as the "Menhaden" or "Moss Bunker." These fish, it is alleged, are of larger size than sardines, and have not heretofore been used as an article of food, owing to their numerous fine bones. Applicants set forth that they have been accustomed to treat them by a certain patented process, whereby their bones become softened, and they are converted into a valuable article of food. As thus prepared they have packed them in suitable boxes as sardines are packed, placed them upon the market, and adopted the name or label "American Sardines" for them, by which it is alleged they are known to the trade, and appropriately designated, as to source or origin, as the product or article prepared and sold by the American Sardine Company. This name, it is said, is neither "the true denomination of the goods," nor of the fish themselves before their preparation, but is merely an arbitrary mark calculated to designate this manufacture as a product furnished the trade by this company, and is no further descriptive of the product than merely as such a designation of it. This is all of the substance of applicants' arguments.

It is acknowledged that the word "sardines" is not intended to truly indicate, and does not truly indicate, the contents of the boxes—the kind of fish they contain. That word, then, is obviously calculated to deceive when placed on a box of applicants' prepared fish as a label. But the word "American" employed with it is supposed to obviate this objection. This word, however, is, from the nature of the case, merely de

scriptive. It is in common use to distinguish all sorts of products made in this country from foreign products. It cannot be divested of that significance when placed upon an article displayed for sale. It does not diminish the deception which the false name applied to the boxes of fish is naturally calculated to convey. It rather aids that deception, for in fact there are no American sardines. The designation of the boxes of fish as "American Sardines," therefore, is but the adoption of a false name for them. If there were any American sardines known, or if any should be discovered in the waters of any of our coasts, American sardines would be their true name, and for that reason could not constitute a trade-mark to designate them.

These words have not the virtue of a new name, a "coined" word, which, like the word "cocoaine," for instance, may be a legal trade-mark. Especially is this true when they are applied as a label upon boxes of fish like ordinary sardine-boxes. They are simply a misnomer in such a use, calculated to produce a false impression. It is immaterial that, on account of their large size, an examination of the fish will readily undeceive the purchaser. The effect of the mark itself is alone to be taken into consideration. If that is a false mark merely, and likely to be deceptive, it is not a legal trade-mark and ought not to be registered. Such I regard it. The decision of the Examiner of Trade-Marks is sustained.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,304.—*Machines for Moving Iron at the Rolls.*—Granted to CHARLES HEWITT, June 7, 1859. Hearing May 21, 1873.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL P. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALSER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860. No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,486.—*Brakes for Power-Looms.*—Granted to R. and GORDON R. REYBOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHERBLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. HARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OTIS TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,886.—*Improvement in Cultivators*, granted to MILTON ALDEN, May 10, 1859.

Claim.—The within-described arrangement and combination of the adjustable shares B, the frame A, and the raised thills C, which are made out of one piece, with the handles D, to operate substantially in the manner and for the purpose specified.

23,921.—*Improvement in Harvesting-Machines*, granted to MOSES G. HUBBARD, May 10, 1859.

Claim.—1. The conformation of the intermediate fingers of a reaping and mowing machine having a conical form with a straight outline from point to heel, as herein set forth, so as to present a straight gradual taper on the under side, as well as above, the whole being constructed and arranged as herein specified.

2. The safety-flange *e* for securing the pitman-connection, when constructed and located substantially as set forth.

23,924.—*Improvement in Mail-Bags*, granted to THOMAS J. LAMDEN, May 10, 1859.

Claim.—1. The placing of the staples or buckles on the flap of the bag or pouch so that when the flap is turned down said staples or buckles will pass through the grummets, as herein stated.

2. The manner of forming the seams of the bag or pouch so that they cannot be cut open and resewn from the outside of the bag without instant detection on looking at the seam, as its whole character must be changed in any such attempt or effort, as described.

Disclaimer filed May 9, 1873.

Disclaims the second clause of claim.

23,950.—*Improvement in Clock-Dial*, granted to S. E. ROOT, May 10, 1859.

Claim.—The combination of a clock-dial, B, metallic back A, frame C, as a new manufacture, specifically as and for the purpose described.

23,970.—*Improvement in Stoves*, granted to JOHN G. WIDMANN, May 10, 1859.

Claim.—The arrangement and combination of the gas-tubes *d* with the cylinder D and fire-openings *b*, so that the gases which arise from the heating of the coal will be compelled to pass down into the fire, as herein shown and described.

23,957.—*Improvement in Lathes for Turning Irregular Forms*, granted to CHARLES SPRING and ANDREW SPRING, May 10, 1859.

Claim.—The combination of a griping-chuck, by which an article can be so held by one end as to present the other free to be operated upon, with a rest preceding the cutting-tool, when it is combined with a guide-cam, or its equivalent, which modifies the movement of the cutting tool, all operating together for the purpose set forth.

23,983.—*Improvement in Cooking-Stoves*, granted to HENRY G. LEONARD, May 10, 1859.

Claim.—1. So constructing and arranging one or more of the oven-plates of the stove that it or they can be removed and the flue or flues cleaned and the plates replaced, substantially as described, without loosening or separating the plates which form the outside of the stove.

2. Making one or more of the interior flue-plates so that it can be removed and the flue cleaned, and the plate replaced, substantially as described, without loosening or separating the plates which form the outside of the stove.

DISCLAIMERS FILED.

23,294.—THOMAS J. LAMDEN.—*Improvement in Mail-Bags*, granted May 10, 1859. Disclaims:

"The second clause of the claim of invention set forth in his said patent."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date May 6, 1873.]

6,625.—*Carpet.*—OTTO HEDINGER, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed April 23, 1873.

6,626.—*Type.*—JULIUS HERRIET, New York, N. Y., assignor to DAVID WOLFE BRUCE, same place. Application filed April 21, 1873.

6,627.—*Type.*—JULIUS HERRIET, New York, N. Y., assignor to DAVID WOLFE BRUCE, same place. Application filed April 21, 1873.

6,628.—*Clock-Front.*—EDWARD INGRAHAM, Bristol, Conn. Application filed February 19, 1873.

6,629.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,630.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,631.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,632.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,633.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,634.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,635.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,636.—*Bread-Plate.*—HENRY S. MCKEE, Pittsburg, Pa. Application filed April 17, 1873.

6,637.—*Trimming.*—JAMES PHIPPS, Philadelphia, Pa., assignor to MARTIN LANDENBERGER & COMPANY, same place. Application filed April 15, 1873.

6,638.—*Trimming.*—JAMES PHIPPS, Philadelphia, Pa., assignor to MARTIN LANDENBERGER & COMPANY, same place. Application filed April 15, 1873.

6,639.—*Casket-Handle Socket.*—CEPHAS B. ROGERS, Meriden, Conn., assignor to C. ROGERS & BROTHER, same place. Application filed April 3, 1873.

6,640.—*Casket-Handle Socket.*—CEPHAS B. ROGERS, Meriden, Conn., assignor to C. ROGERS & BROTHER, same place. Application filed April 3, 1873.

6,641.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,642.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,643.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,644.—*Fountain-Basin.*—JONATHAN MOORE and WILLIAM H. WILKINSON, Brooklyn, N. Y. Application filed April 19, 1873.

6,645.—*Hot-Air Register.*—EDWARD A. TUTTLE, Morristown, N. J. Application filed April 19, 1873.

6,646.—*Hot-Air Register.*—EDWARD A. TUTTLE, Morristown, N. J. Application filed April 19, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date May 6, 1873.]

1,244.—*Caps of Bottles of Cordials, &c.*—CAZADE & CROOKS, New York, N. Y. Application filed April 12, 1873.

1,245.—*Packages of Cordials, &c.*—CAZADE & CROOKS, New York, N. Y. Application filed April 12, 1873.

1,246.—*Bottles of Cordials, &c.*—CAZADE & CROOKS, New York, N. Y. Application filed April 12, 1873.

1,247.—*Bottles of Cordials, &c.*—CAZADE & CROOKS, New York, N. Y. Application filed April 12, 1873.

1,248.—*Sponge or Butter Crackers.*—JOSEPH FOX, Lansingburg, N. Y. Application filed April 17, 1873.

1,249.—*Clock and Watch Oil.*—EZRA KELLEY, New Bedford, Mass. Application filed April 14, 1873.

1,250.—*Chewing-Tobacco.*—WALKER, MCGRAW & CO., Detroit, Mich. Application filed April 24, 1873.

1,251.—*Candles.*—GEORGE DELANO, New Bedford, Mass. Application filed April 26, 1873.

1,252.—*Medicinal Oil.*—ELIZABETH F. LIBBY, Allegheny City, Pa. Application filed April 3, 1873.

1,253.—*Plug Chewing-Tobacco.*—LIGGETT & MYERS, St. Louis, Mo. Application filed April 23, 1873.

1,254.—*Plug Chewing-Tobacco.*—LIGGETT & MYERS, St. Louis, Mo. Application filed April 23, 1873.

1,255.—*Plug Chewing-Tobacco.*—LIGGETT & MYERS, St. Louis, Mo. Application filed April 23, 1873.

1,256.—*Plug Chewing-Tobacco.*—LIGGETT & MYERS, St. Louis, Mo. Application filed April 23, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date May 6, 1873.]

ORIGINAL PATENTS.

138,465.—*Boiler-Flue Scraper.*—MARCUS M. AMMIDOUN, West Roxbury, Mass. Application filed October 30, 1872.

A tube-scraper having four arms connected together with four wire hooks, and spread to fit the tube by means of springs.

Claim.—The combination and arrangement of the arms *a a' a a'*, recesses *e e*, and springs *d d*, with the hooks *f f*, substantially as specified.

138,466.—*Water-Filter.*—PHINEHAS HALL and BENAIAH FITTS, Worcester, Mass. Application filed February 13, 1873.

Two compartments, separated by a felt filter, secured upon a grate, over which is placed a sheet of fine metallic gauze to prevent the passage downward of the filtering material. The chamber at the mouth of the induction-pipe is closed by a weighted valve. The water discharged from the chamber at the top, in a line parallel with the plane of the filter, passes over its under surface, washing from it all impurities.

Claim.—1. The combination of the induction-pipe G with the self-adjusting mouth J, as arranged with relation to the mechanical or felt strainer C, for the purpose set forth.

2. The combination of the self-adjusting mouth J and strainer C, as arranged in relation to each other, with the wash-out pipe H, for the purpose specified.

3. The combination, substantially as described, of a felt strainer, C, or its mechanical equivalent, with the filtering and purifying chambers A and B, when so arranged that the process of filtration through it and the process of cleansing its outer or straining surface from the impurities eliminated from the filtered water shall be carried on simultaneously, in the manner described.

138,467.—*Fire-Alarm.*—WILLIAM A. BARNES, Bridgeport, Conn. Application filed March 1, 1873.

An explosive button or cartridge charged with any composition that may be ignited by heat, but not by accidental percussion, is applied to exposed places by an attached pin or screw, so as to give an alarm wherever a fire occurs. To avoid the risk of flying fragments, the capsule or envelope is made of a single piece, so as to open on explosion.

Claim.—1. A metallic case or shell, *a*, with its base and cover in one piece and attached by a screw or nail, *f*, to facilitate its opening when exploded, and thereby avoid liability to fly in fragments, as described and represented.

2. A fire-alarm torpedo or cartridge, consisting of a shell or case, *a*, fastened in any desired locality by a nail, screw, or other similar fastening, *f*, and inclosing within it so as not to be exposed externally any known composition, *c*, ignitible, not by concussion, but by heat conducted through the metal of the case or shell, as and for the purpose described and represented.

138,468.—*Wrench.*—STEPHEN BARRY and FRANK PERKINS, Brunswick, Ohio. Application filed January 17, 1873.

The oscillation of the handle serves to adjust the wrench to the nut.

Claim.—The herein-described wrench, consisting of the shank A, head B, movable jaw C with arm D, handle E with curved head F, and the connection *g*, all combined and arranged substantially as described, and for the purpose set forth.

138,469.—*Traction-Wheel.*—WILLIAM ERSKINE BARTLETT, Edinburgh, North Britain, assignor to THE NORTH BRITISH RUBBER COMPANY, (limited,) same place. Application filed December 14, 1872.

Segmental blocks are secured to the tires of the wheels by means of transverse bolts, while the cellular metallic shoes are retained in position by being arranged between the segmental blocks, and have a bearing upon an elastic block.

Claim.—1. Elastic tires constructed of segmental blocks and the same secured to the wheels by means of transverse bolts and bushes, substantially as above described.

2. The cellular metal shoes constructed and retained in position on the wheel in the manner and for the purpose above described.

3. The combination of the segmental retaining-blocks R and the filling-blocks *r* for sustaining the pressure of the shoes S while the same are passing over the ground, as set forth.

138,470.—*Potato-Digger.*—SILAS BIGELOW, Newburg, and LEANDER C. BIGELOW, Kirtland, Ohio. Application filed January 8, 1873.

An axle-tree mounted upon wheels has two projecting arms, which are secured at their outer ends by a cross-bar. At a short distance from the axle-tree is hinged a group of fingers which are secured together by cross-bars, the fingers resting upon the axle-tree, where they are secured by a button.

Claim.—The herein-described implement, consisting of the adjustable rake B, hinged as described, arms E, axle-tree F, and wheels A, all constructed to operate substantially in the manner as and for the purposes specified.

138,471.—*Die for Making Blanks for Ship-Hooks.*—CHARLES E. BILLINGS, Hartford, Conn. Application filed March 12, 1873.

A blank roughly formed in one set of dies is transferred to another set, which finish it, as shown in the drawing, and from this blank is afterward produced by other means the completed ship-hook.

Claim.—The two several sets of dies set forth and described.

138,472.—*Spring Bed-Bottom.*—HIRAM H. BLAIR and STEPHEN BARRY, Brunswick, Ohio. Application filed March 24, 1873.

A saddle, consisting of two plates hinged together, is clamped to the slat and to the spring.

Claim.—The saddle consisting of the two parts, B C, constructed as shown, in combination with the spring A and slat G, as and for the purpose set forth.

138,473.—*Medical Compound.*—AVERY BROWN, Fond du Lac, Wis. Application filed March 1, 1873.

Sarsaparilla, lignum vitæ, elder-flowers, burdock-root, yellow-dock, sassafras-bark, iodide of potash, dandelion, mandrake, bromide of potash, alcohol, and winter-green oil.

Claim.—1. A compound composed of the first twelve articles named, in the proportions, and for the purposes set forth.

2. A compound composed of the first twelve articles with the addition of silk-weed, in the proportions substantially as described.

3. A compound composed of the first twelve articles with the addition of cypripedium, substantially as described.

4. A compound composed of the first twelve articles with the addition of wild-cherry-tree bark, substantially as set forth.

138,474.—*Wave-Power.*—CHARLES BUCKNER, San Francisco, Cal., assignor of part interest to HENRY BRUNS, JOHN REINERS, JOHANN H. A. LUDWIG, and ISAAC M. WARD, same place. Application filed July 25, 1872.

A water-engine is actuated by a force-pump driven by the rise and fall of waves acting upon a buoy suspended between ways. A water-reservoir, with springs to give continuity of flow, intervenes between the engine and the pump. The second claim relates to means for adjusting the position of the buoy to varying heights of tide.

Claim.—1. The reservoir M, provided with the springs T T and piston L, in combination with the floating buoy B, pump P, and water-engine E, substantially as and for the purpose hereinbefore set forth.

2. The rod I, provided with a rack in which bolts *b b'* work on spring *z*, and lever *k* actuated by the arms *a a'* and projections *c c'*, together with the slide-box S, and springs *s s*, and oval slot *r*, substantially as and for purposes set forth.

138,475.—*Drier.*—JAMES BUTTERWORTH, Philadelphia, Pa., assignor to himself and CHAS. C. BUTTERWORTH, same place. Application filed January 24, 1873.

For the purpose of equalizing the heat of the drying-surfaces, steam or hot air is admitted at one end of one series of cylinders and at the opposite end of the other series.

Claim.—A drying-machine in which there are parallel hollow cylinders, to which steam or hot air is admitted so as to traverse some of the cylinders in one direction, and others in the opposite direction, substantially as and for the purpose set forth.

138,476.—*Machine for Unloading Flat Cars.*—GEORGE S. CALDWELL, Auburn, N. Y. Application filed September 4, 1872.

The scraper is supported upon wheels which travel upon rails extending over the ends of the car-platform, so that the rails of the adjoining cars will nearly meet.

Claim.—1. In combination with one or more cars for carrying earth or other material, the scraper, with wheels thereunder upon which it is supported and carried, and the rails or guides for guiding and directing said scraper over or upon said cars, as and for the purpose described.

2. In combination with a series of cars for carrying earth or other material, having guiding-rails with their ends extended so as to form a permanent and continuous track throughout the series of cars, with a scraper having supporting-wheels to run and be guided on said rails, as and for the purpose described.

3. The combination of the attachment *k* with the scraper, as and for the purpose described.

138,477.—*Pump.*—JOHN F. CARLL, Pleasantville, Pa. Application filed February 14, 1873.

The pump may be removed without disturbing the tubing, being held in place only by the tapering packing, and can be withdrawn by means of the pump-rod.

Claim.—The described arrangement and combination of the barrel *b*, with its tapering packing *d* and valves *e* and *f*, the whole attached to the pump-rod and held in position in the tube *a* by static pressure, and operating substantially in the manner and for the purposes set forth.

138,478.—*Cooler for Liquors.*—JAMES W. COLLIER, New York, N. Y. Application filed April 14, 1873.

A glass vessel, having a tightly-fitting cap, is set in a tank, which may be lined with lead or other material. Two tinned tubes enter the vessel. The one connecting with the keg containing the liquor passes just below the cap, and the one connecting with the pump for drawing the cooled liquor extends nearly to the bottom of the vessel. Water from the ice around the top of the vessel trickles down the sides of the vessel and cools the liquor contained therein. The tank contains an overflow-pipe.

Claim.—1. An apparatus for cooling palatable liquors, consisting of one or more glass vessels, in combination with a tank, in the manner and for the purpose described.

2. Cooling potable liquors by the application of ice and water, in the manner hereinbefore described.

138,479.—*Bale-Tie.*—FREDERIC COOK, New Orleans, La. Application filed April 24, 1873.

One end of the band engages with the loop, and the other end is secured to the shank of said loop.

Claim.—The cotton-tie fastening, as shown and described, having a detached loop or loops, D, secured to the end of the band, for the purpose specified.

138,480.—*Bale-Tie.*—FREDERIC COOK, New Orleans, La. Application filed April 23, 1873.

Claim.—The cotton-tie, constructed as shown and described, having the loop D at right angles with the body of the band and the bend E in a double thickness of the band.

138,481.—*Cotton-Bale Tie.*—FREDERIC COOK, New Orleans, La. Application filed April 28, 1873.

The bale-tie buckle is slipped into the looped end of the band and held in position square with the band without riveting, and

forms a loop for the reception of the hook of the other end of the band.

Claim.—The sliding loop A, substantially as shown and described.

138,482.—*Cotton-Bale Tie.*—FREDERIC COOK, New Orleans, La. Application filed April 21, 1873.

Claim.—A clasp for cotton-bale ties, having two pairs of raised lips, C C, recessed for the reception of the bent ends of the bands, and so made, with relation to the body of the clasp, as that said ends shall pass between the lips and body of the clasp, as and for the purpose described and represented.

138,483.—*Cotton-Bale Tie.*—FREDERIC COOK, New Orleans, La. Application filed September 3, 1872.

Claim.—1. The cotton-tie link made with the planes of the band-seats at an angle with each other, having a fold and twist in the middle.

2. The end flanges, made at an angle with the plane of the band-seat, for the purpose shown, and substantially as described.

3. The combination of the angular band-seats with end flanges and looped ends of metallic bands for bales.

138,484.—*Cotton-Bale Tie.*—FREDERIC COOK, New Orleans, La. Application filed April 22, 1873.

One end of the band is bent at right angles with the band so as to form a band-seat for the other end of the band, which has been previously bent into a loop form or hook, and is passed into the hook or loop, which stands at right angles with the band, as aforesaid.

Claim.—The construction of the cotton-tie, as shown and described, without a buckle or link.

138,485.—*Excavator.*—JOHN M. CURLESS, Cedar Rapids, Iowa. Application filed March 12, 1873.

The cart is raised and lowered by the chains being wound upon eccentrics, which are operated by levers and cords, the cords being wound on drum on the shaft, which is operated by gearing in connection with one of the main wheels. A wedge is used to throw the shaft into or out of gear with the wheel.

Claim.—1. The cart C, composed of two parts hinged together, substantially in the manner described and shown, and supplied with plows C', as and for the purpose set forth.

2. The combination of the cart C, lifting-chains D D, eccentrics or rollers E E, levers F F, cords *f f*, drum G, shaft *g*, gears g^2 g^3, frame A, axle A', and wheels B, substantially as and for the purpose set forth.

3. The inclined plane or wedge H, fitted to slide upon the side of one of the bearings of the shaft *g*, and beneath that end of the latter having the pinion g^3, substantially as and for the purpose specified.

138,486.—*Velocipede.*—GEORGE DISMER, Mound City, Ill. Application filed October 16, 1872.

Each end of the axle is provided with compound cranks, which are constructed at right angles to each other. To these cranks are attached rods, one of which is pivoted below the bearing of the hand-lever, and the other above this bearing.

Claim.—The combination of the double cranks B B on shaft or axle *c* with their connecting-links D D D D, levers E E, and body A, arranged and constructed to operate substantially as and for the purpose set forth.

138,487.—*Buckle.*—SAMUEL H. DOUGHTY, Nyack, N. Y. Application filed March 22, 1873.

Improvement on patent No. 55,532. The slide covered by said patent has an eye bent on one of its sides, and is attached to one end of a belt. An ornamental buckle is secured to the other end, and is adjustable by hooks struck from its under surface or a tongue secured to a cross-bar operating in eyelet-holes. The eye engages with a hook on the under side of the buckle, or a swinging hook on its cross-bar.

Claim.—The within-described fastening having a hook and eye, D B^2, in combination with the frame B and sliding bar C, serving relatively to each other and to a belt, A^1 A^2, as and for the purposes herein specified.

138,488.—*Refrigerator.*—BENJAMIN RANDOLPH DUVAL, Portsmouth, Va. Application filed December 9, 1872.

A series of vessels are arranged one within the other, with a packing of feathers or sawdust between them.

Claim.—The refrigerator, composed of the outer case or carrier, and series of contained vessels, forming non-conducting and freezing chambers, as and for the purposes specified.

138,489.—*Insulator for Telegraph-Lines.*—PETER EBY and MICHAEL B. FENDINGER, Kinzer's P. O., Pa. Application filed December 24, 1872.

The telegraph-wire is supported by a divided cylindrical glass insulator, having the lower half grooved or recessed and the upper half correspondingly ribbed so as to cause the division-line to descend from the wire on either side. Partial flanges on the ends of the glass segments allow the insulator to be locked in the wooden supporting-arm by a partial rotation.

Claim.—The combined construction of the segments or portions A B when a semi-groove for the wire is, in each portion, so raised and beveled in their connection as to exclude water, and locked by a full half turn by means of the collars or flanges *a b* on one side, and the ing or partial shoulder or flange *a' b'* on the other side, all substantially made and applied in the manner and for the purpose specified.

138,490.—*Spring Bed-Bottom.*—EDWIN S. FIELD, Hartford, Conn.—Case A. Application filed December 2, 1872.

The fabric is formed of V-shaped links having hooked ends, the hooks taking into the apex of the next succeeding link. The straight-edged links at the sides have one long leg hooked into the next straight-edged link, and one short leg hooked into the apex of the V-shaped link.

Claim.—1. A wire netting composed of the V-shaped links hooked together, substantially as described, for the purpose set forth.

2. The peculiarly-shaped link *g* for forming the straight edges of the netting, having one long leg hooked so as to take into the angle of the next of these links, and one short leg running off obliquely, and hooked so as to take into the angle of one of the V-shaped links, substantially as and for the purpose set forth.

138,491.—*Spring Bed-Bottom.*—EDWIN S. FIELD, Hartford, Conn.—Case B. Application filed December 2, 1872.

Diamond-shaped links are made of one piece of wire having hooks on the two extreme ends of the wire to take into the angle of the adjacent link, the two side angles being held together by rings.

Claim.—1. As a component part of a bed-bottom, a diamond-shaped link made of one piece of wire, and having the two ends of the wire turned downward at one of the angles of the link so as to form a hook to take into an angle of the next link, substantially as and for the purpose set forth.

2. A bed-bottom composed of such links as are specified in the last clause, hooked together at two of the angles of the links, and united at the other two angles by subsidiary rings or links, substantially as described.

138,492.—*Cotton-Bale Tie.*—WILLIAM D. FIELD, Providence, R. I. Application filed March 24, 1873.

Claim.—1. A cotton-tie formed from a single plate, and having the slot and two hollow projecting arms, B and B', as described, for the purposes specified.

2. The cross-bar E in combination with the hollow projecting arms B and B', the whole arranged and operating in the manner substantially as described.

138,493.—*Curtain-Fixture.*—CHARLES E. FRITTS, Oneonta, N. Y., assignor to JOSEPH S. FRITTS, same place. Application filed January 3, 1873.

The pawl is attached to the spindle, and is double or has two arms; said pawl operates in connection with a ratchet formed on the end of the roller. The end of the spindle is slotted to receive a spring that operates to prevent the coiled spring inside the roller from unwinding when the roller is taken out of the bracket.

Claim.—1. An improved curtain-fixture, consisting of a double pawl, D E, interior ratchet and end plates F, spindle A B, bracket H, spring S, and washer W, in combination with a roller, P, and spiral spring X, constructed and operating substantially as herein set forth and described.

2. An improved stop-work for curtain-fixtures, consisting of a double pawl, D E, and combined end plate and ratchet F, constructed and operating substantially as and for the purposes described.

3. In curtain-fixtures, attaching a pawl to the spindle, substantially as and for the purposes herein set forth and described.

4. A slotted spindle, A B, combined with a spring, S, substantially as set forth.

5. The combination, with the pawl D E, ratchet F, and spindle A B, of a spring, S, substantially as and for the purposes herein set forth and described.

138,494.—*Sash-Holder.*—JOSEPH F. GRAHAM, Warrensburg, Mo., assignor of one-half his right to ALEXANDER BETTES, same place. Application filed September 4, 1872.

The ordinary set-screw which operates a friction-plate is furnished with a jointed drop-handle.

Claim.—In combination with the metallic strap F, the screw D provided with swinging wrench E, constructed and operating in the manner and for the purposes substantially as set forth.

138,495.—*Washing-Implement.*—CYRUS R. GRAMM, Bainbridge, Pa. Application filed April 16, 1873.

A wash-pounder constructed with concentric rings, with the outer one of less length than the inner, with its edge curved outward and all attached to a plate covered by a conical-shaped top, through which the cylinder is passed to receive the handle.

Claim.—A series of three or more concentric rings or cells, 1 2 3, open below, above closed by the disk D, which separates the flange A from the conic top B, the whole arranged and constructed in the manner and for the purpose specified and shown.

138,496.—*Station-Indicator.*—OLIVER B. GRIGGS, Mansfield Centre, Conn. Application filed October 23, 1872.

The actuating-lever is cranked to bear against arms attached to slides which carry respectively a hook and a bar, which operate on the apron-barrels and revolve them in either direction, according as the lever is moved.

Claim.—The combination of the arm *b*, shaft *c*, cranked, as described, arms *f* and *f'*, slides *d d'*, springs *i i'*, spring-hook and spring-arm *g g'*, rolls A B provided with ratchets $A A^1$, apron C, and spring A^1, constructed and operated substantially as described, for the purpose set forth.

138,497.—*Cotton Seed Planter.*—ALBERT D. GRISWOLD, Rocky Hill, Conn. Application filed March 22, 1873.

A cotton-seed planter with two cylinders; these cylinders are revolved by means of band-connection from the drive-wheel; to the cylinders are secured V-shaped feed-teeth, which fit V-shaped

notches in a yielding feed-plate. The feed-plate is adjustably secured in position upon screw-bolts, and is supported by spiral springs. To the front of the frame is secured an opening-plow, while the rear is provided with covering-plows.

Claim.—The combination of the feed-rollers *c* having feeders *d*, adjustable yielding feed-plate d^2, gears *f* with the cultivator A, covering-plates A^1, and hoppers *g* g^1, arranged and operating substantially as and for the purpose set forth.

138,498.—*Flash-Light Signal-Recorder.*—MOSES GUSTIN, Troy, Pa. Application filed December 7, 1872.

The shield or screen of a flash-light lantern is operated by a lever, which is connected with a pawl and ratchet for feeding a fillet of paper by each movement, while an adjustable pencil-holder causes an automatic record to be made simultaneously of each signal as it is made by the lantern.

Claim.—1. The lever E and the adjustable lever *e* for operating the shield C at one end to expose the light, and the lever R at the other end to operate the ratchet-feeding mechanism, as shown and described.

2. The movable paper-holder L for receiving the register, in combination with the ratchet-wheel and friction-roller *i* and presser-roller *m*, as constructed to operate as described.

3. The combination of the movable pencil-holder H with the knob *k* for operating it laterally, and the levers E *e* and *g* with the mechanism for moving the strip of paper one or two notches, as may be desired, substantially as herein set forth.

138,499.—*Roll for Rolling Iron for Horseshoe-Nails.*—JOHN HUGGETT, Eastbourne, and JOHN ALBERT HUGGETT, Clapham, England. Application filed January 21, 1873.

Two rolls on separate shafts and overlapping one another, with a groove partly in both at the point of overlap and a collar held by a nut on the shaft of one roll that overlaps and supports the other roll to prevent endwise spread. The peripheral angles or corners of the walls of the groove are beveled and roughened to facilitate the entrance of the rectangular bar and to turn it vertically edgewise, if by accident it shall have been presented flatwise.

Claim.—1. The combination and arrangement of rolling machinery, substantially as before set forth, consisting of two rolls, each with a flange at one side only of its rolling-face, and of an adjustable collar for sustaining the end thrust of the rolls, and for the end-wise adjustment of them after re-turning.

2. The method of causing the nail-rod to enter truly between the rolls by beveling or inclining the edges of their flanges, substantially as described.

3. The use of tar or such like viscous fluid to prevent the nail-rod sticking in the cavities of the rolls, substantially in the manner as described.

138,500.—*Treating Gold and Silver Ores.*—JOSEPH KALLMES, San Francisco, Cal. Application filed March 13, 1873.

Claim.—The process, substantially as herein described, for desulphurising and chloridising gold and silver by injecting, first, chlorine gas into the pulp, then dry steam or hot air, without roasting the ore, substantially as set forth.

138,501.—*Molasses-Pitcher.*—WILLIAM C. KING, Pittsburg, Pa. Application filed April 8, 1873.

A covered pitcher with an attachment pivoted at or on its sides, with a thumb-piece extending in rear of the pivot, and to the outside of the spout, with a drip which serves to cut off and return the sirup to the pitcher, and is closed by a spring on its axle or pivot.

Claim.—The pouring-lip of a pitcher, provided with a pivoted shield having an inward projection, which will wipe off the drip and carry it back into the pitcher, substantially as herein described.

138,502.—*Jelly-Jar.*—WILLIAM C. KING, Pittsburg, Pa. Application filed March 5, 1873.

Claim.—1. A new article of manufacture—viz., the jelly-glass A, provided with a V-shaped groove near its upper edge, substantially as herein described, and for the purpose set forth.

2. The jelly-glass A in combination with the lozenge-shaped ring C (when viewed in cross-section) and the lid D, substantially as herein described, and for the purpose set forth.

138,503.—*Candy-Jar Lid.*—WILLIAM C. KING, Pittsburg, Pa. Application filed March 5, 1873.

Claim.—A new article of manufacture—viz., a lid for candy-jars, said lid being constructed by the pressing and polishing process, substantially as hereinbefore described.

138,504.—*Obtaining Bisulphide of Carbon from Gas-Lime, &c.*—JULIUS KINCHER, New York, N. Y. Application filed October 19, 1872.

Gas-lime, &c., is mixed with an equal quantity of clay, loam, or sand, and subjected to heat in a closed retort. The vapors evolved are conducted over charred or other coal heated to a light red.

Claim.—The production of bisulphide of carbon, in the manner and by the process above described, from the waste material used in the manufacture of coal-gas.

138,505.—*Machine for Trimming Lumber.*—CHANCY LAMB and THOMAS J. FRAZIER, Clinton, Iowa. Application filed September 30, 1872.

Two saws are arranged upon a long arbor, one of them being movable, the other stationary. A series of endless belts carry the lumber by the saws which cut off the damaged ends.

Claim.—1. The rock-shaft I, levers J, rocker-arms K, forked connecting-rods L, radius-links N, pulleys M M^1, guide-rods O, chains Q, and shaft P, the latter rotated in any convenient manner, and all operating substantially in the manner described, for carrying the lumber to and past the saws.

2. The arrangement with relation to the arbor B of the friction-gears or pulleys *k l n o q r* and shafts *m* and *p* for rotating the shaft P, as shown and set forth.

138,506.—*Wagon-Body.*—HUBERT LAVERS and HERMAN STIEVATER, Greenfield, Wis. Application filed September 16, 1872.

Claim.—1. Key-bolt E, frame F, hooks G, and seat H, all in combination with wagon-body A, substantially as described.

2. A wagon-body, the sides and ends of which are joined together by the bolts K and L and spring-bolt I, substantially as described.

138,507.—*Folding Screen.*—MANUEL G. LAZARUS, Pittston, Pa. Application filed April 15, 1873.

A screen with two folding wings and a mirror pivoted in the center.

Claim.—A portable folding screen and an adjustable mirror, B, arranged substantially as described.

138,508.—*Turpentine Still.*—ARCHIBALD K. LEE, Galveston, Tex. Application filed April 12, 1873.

Modification of Patent No. 131,550, reissued April 15, 1873. The heating-pipe within the still is a conical coil, and within the reservoir and liquidizing-chambers is not perforated. The agitator of the liquidizing-chamber has horizontal arms or beaters in contradistinction to the revolving rake of the former patent. The reservoir is connected to the separator by a pipe for the escape of vapors from the reservoir. The valve-connections between the liquidizing-chamber, reservoir, and still are guarded by strainers of different-sized mesh. Operation same as in former patent.

Claim.—1. The still B, having a jacket, C, arranged in connection therewith, forming a superheating steam-chamber, C^1, and the circular cone-shaped worm B^1, the same being connected, combined, and arranged to operate substantially as described.

2. In combination with the worm B^1, the pipe K, having coils K^1 K^2 formed therein or connected therewith, the whole being arranged so that the superheated steam from the coil shall serve as the heating medium for the reservoir G and tub D, substantially as described.

3. The reservoir G, still B, jacketed pipe H, sliding valve *h'*, and strainer A, the same being constructed, combined, and arranged to operate substantially as described.

4. The liquidizing-tub D, reservoir G, sliding valve *d'*, and double strainer g^1 g^2, the whole being constructed, combined, and arranged to operate substantially as described.

5. The revolving agitator or stirrer herein described, consisting of the shaft F' and the series of independent arms F F, formed as shown, the whole constructed and combined to operate substantially as set forth.

6. The liquidizing-tub D, agitator F F', and independent steam-jets *d d*, the same being combined and arranged to operate substantially as described.

7. The still B, tub D, reservoir G, separator M, and pipes L D^1 D^2, the whole being constructed, combined, and arranged to operate substantially as described.

138,509.—*Lamp.*—JAMES E. LEIGHTON, Lowell, Mass. Application filed January 18, 1873.

The draft-tube extends through the lamp, being secured thereto by a washer having leather packing beneath it, and by a lock-nut. The regulating-tube is moved over the wick through the medium of a thumb-rod and eccentrics.

Claim.—1. The center draft-tube B extending through the bowl of a lamp, when combined with the lock-nut H, packing P, and washer K, as and for the purpose specified.

2. The combination of the thumb-rod C, eccentrics L L, eccentric-pins N N with the regulating-socket D, as and for the purpose set forth.

3. The combination, with a central draft-tube of a lamp, of the lock-nuts H H', packing P, and washer K, as and for the purpose specified.

138,510.—*Cupola-Furnace.*—PHILIP W. MACKENZIE, Blauveltville, N. Y. Application filed June 20, 1872.

The products of combustion from the furnace are projected downward through pipes passing through the steam-boiler or water-jacket surrounding the base of the furnace, and pass thence into the chimney, whereby the heat of the products of combustion is utilized and the blast maintained.

Claim.—1. The combination, with a steam-generator heated by a reducing-furnace, of a steam-injector deriving its supply of steam directly from said generator, and operating to pass the products of combustion of said furnace to the generator, and thence to the chimney or main outlet, as shown and described.

2. The steam-generator G, made up of vertical sections arranged to form a jacket on the outside of the shell of the furnace, and provided with draft-flues *e* and water-spaces *f*, in combination with an upper outlet, I, from the furnace, a steam-injector, H, a lower escape passage or outlet, L, the chimney J, and a lower air-supply opening or openings, *d*, essentially as shown and described.

138,511.—*Self-Acting Spinning-Mule.*—PETER MCGOVERN, North Andover, Mass., assignor to GEORGE L. DAVIS, JOHN A. WILEY, JOSEPH M. STONE, GEORGE G. DAVIS, JOSEPH H. STONE, and JAMES H. DAVIS, same place. Application filed August 24, 1871.

Claim.—1. The combination of the worm and the driving-gear of the roller-shaft revolving loosely thereon, and the clutch by which motion is imparted from the gear to the shaft, with the clock, and the shipper-lever or other equivalent means by which the clock disengages the clutch B to stop the rollers, substantially as described.

2. The combination and arrangement of the clock with and upon the shipper-lever so that the clock is carried upon the lever, substantially as described.

3. The combination and arrangement of the incline *b*, that puts the clock *c* and clutch G^2 into gear, and the roller *a* upon the spindle-carriage, so that the delivering-rollers will be started a sufficient time before the carriage is entirely run in to deliver nearly all the yarn made at each stretch to be wound up by the spindles, substantially as described.

4. The balance-rod Q, in combination with the spindle-carriage and the worm I^1 or its equivalent, for drawing in the carriage while the twist is being put in, and also in combination therewith the cam Q^2 and its lever Q^3 or their equivalents for producing the engagement and disengagement of the rod Q and the carriage and worm-gear, substantially as described.

5. The combination of the endless screw or worm I^1 with the clock that determines the twist and the rack upon the balance-rod, so that one worm drives both of them, substantially as described.

6. The combination of the clock P, the catch *r*, and the escape-lever N, substantially as described.

7. The combination of the clock P, the cam *p*, and the worm I^1, and their subordinate devices, to throw the clock into gear, substantially as described.

8. The combination and arrangement of the main driving-shaft and the worm-shaft at a right angle thereto, and the clock and the balance-rod, substantially as described.

9. The combination of the conical sleeve R with the latch or locking rod U of the faller and the rocker-shaft T and its accessories or their equivalents, so that the pawl *s* will be held out of the ratchet during the backing off, and its engagement restored at the commencement of winding on, substantially as described.

10. The combination of the detent-arm T^2 on the rocking shaft or its equivalent with the floor-lever and the latch or locking rod U of the faller, so arranged that when the rod engages with the piece that rides upon the coppin-rail, the floor-lever will be released from the detent, and the backing off stopped and the winding mechanism started, substantially as described.

11. The combination of the radial arm t^1 and its catch t^2 upon the faller-shaft with the hook-rod and counterpoise-lever W, which raises the counter-faller, by which the counter-faller wire is allowed to fall below the top of the spindles while the stretch is made, substantially as described.

138,512.—*Insulator for Telegraph-Lines.*—EDWARD A. MERRELL, East Lyme, Conn. Application filed October 19, 1872.

The telegraph-wire is confined in a curved groove in the top of the glass insulator, and a glass cap held in position by a screw-bolt secures the wire in its position.

Claim.—The combination of the body A, made of insulating material, having the cavity S for a supporting-pin and the curved groove *a*, the cap B made of insulating material, and the screw-bolt D, the whole constructed, arranged, and designed for use substantially as and for the purpose set forth.

138,513.—*Fire-Escape.*—CHARLES C. MILTON, San Francisco, Cal., assignor of one-half his right to EDWARD A. LEARNED, same place. Application filed February 27, 1873.

The sling-seat is attached to a rectangular frame, in the right-hand portion of which is located a powerful compound-lever brake, acting upon a rope which passes through the tubular side, and is attached to the opposite side of the frame, the intermediate portion passing over a pulley on the building. The frame being naturally grasped with both hands by the person descending, the handle of the brake is included within the grasp, thus rendering the descent easily controllable. A central pulley is sometimes used on the frame, as in Fig. 6, to give increased control to the brake.

Claim.—1. The compound-lever eccentric brake E E' provided within the right-hand bar *b* of the frame F, part of the car A A, in combination with the endless rope *r* and pulley-block K, substantially as and for the purpose herein set forth.

2. The compound-lever brake E E' provided within the frame F of the car A A, in combination with the endless rope *r*, sheave *f*, and double pulley-block *k*, substantially as and for the purpose hereinbefore set forth.

138,514.—*Brake-Shoe.*—JOHN W. MOFFITT, Harrisburg, Pa. Application filed March 19, 1873.

The shoe can be laterally disengaged from its holder by slight vertical displacement, and is so arranged to be used if inverted and inserted within the holder; is adapted to be used with either brake-holder to insure the same wear upon each side of the face of the shoe.

Claim.—1. The shoe K, having the two similarly-formed double-hooked tenons A B, in combination with the bits *a e* in the holder W, interlocking vertically, the shoe being reversible, substantially in the manner as and for the purpose herein set forth.

2. The arrangement of the holder-abutments P P^1, in relation to the tenons A B, to effect the sidewise detachment of the shoe from the holder by a limited vertical displacement, substantially as herein set forth.

3. The tenon, having the notch *s* and the cut *c* thereon, as and for the purpose herein set forth.

4. The keying or locking device, composed of the bar D, lug T, wire tab or its equivalent, arranged in the upper abutment, in the manner as and for the purpose specified.

138,515.—*Pipe-Coupling.*—DAVID MYERS, Chicago, Ill. Application filed March 24, 1873.

A frame-work attached to the car-body and to the reservoir end of the supply-pipe is provided with a bar which slides with a peculiar motion, having at one end a fork which catches under the coupling of the pipe and holds it firmly in place, so that pipes cannot be uncoupled until the pressure of air is removed or cut off from the reservoir.

Claim.—The combination and arrangement of the frame D *d*, leg H with inclined top, the movable bar E with a fork, *e*, at one end, the handle F extending up into the hook G, the part K furnished with a slot, *k*, having a depression, *m*, at each end, all constructed and operating, in connection with the pipes A B and valves C C', as and for the purpose specified.

138,516.—*Fruit-Drier.*—GEORGE R. NEBINGER, Philadelphia, Pa. Application filed August 15, 1872.

Claim.—1. The combination of the central furnace-flue C and the air-duct D provided with the funnel E and arms *d*, as and for the purposes herein set forth.

2. The combination of the revolving hot-air duct D provided with arms *d* and trays F, as and for the purposes herein set forth.

3. The combination of the central furnace-flue C, air-duct D provided with arms *d*, and the trays F, as and for the purposes herein set forth.

4. The combination of the vapor-heated air-flue G surrounding the hot-air duct and furnace-flue C, as and for the purposes herein set forth.

5. The combination of the plate or shield I and the hot-air duct D, as and for the purposes herein set forth.

138,517.—*Condenser and Refiner for Spirituous Liquors.*—WILLIAM NEIL, San Francisco, Cal. Application filed April 7, 1873.

After the vapors have been running for a short time through the vessel having perforated partitions, the lower part of each chamber will be filled with the products of condensation, through which the succeeding vapor will have to pass. From the lower part of said chambers overflow-pipes conduct the several grades of condensation to a second partitioned chamber, from which they can be drawn or returned to the still, as desired.

Claim.—1. The vessel A, with its perforated partitions E and F, for directing and condensing the vapors, and forming chambers for holding the condensed products together with its inclosing water-jacket B, substantially as herein described.

2. In combination with the divided vessel A, the discharge-pipes G, H, and I, and the vessel J with its partitions K gradually increasing in height from first to last, substantially as and for the purpose herein described.

3. In combination with the refiner as herein shown, the peculiar discharge vessel or pipe N, having perforated floors, substantially as and for the purpose herein described.

138,518.—*Mode of Constructing Wooden Pulley-Wheels.*—AUGUSTUS NEWELL, Erie, Pa. Application filed March 5, 1873.

Claim.—A wooden pulley-wheel, constructed of quadrant-like segments A A A, &c., and arc-like segments B B B and *b b b*, &c., arranged and attached together, substantially as and for the purposes herein named.

138,519.—*Apparatus for Making Paste.*—GEORGE G. NOAH, Charlestown, Mass. Application filed October 31, 1872.

Steam or hot water is admitted to the jacket to cook the paste, and to the inner tub by means of the induct when required to moisten the mass or for other purposes.

Claim.—The paste-cooking machine, substantially as described, consisting of the agitator C, the vessels or tubs *a b* with the closed space *e* between them, and provided with the induct N and valve P, or such and the faucet *h*, all arranged in manner as represented, and to operate as and for the purpose set forth.

138,520.—*Joint for Sheathing.*—NELSON G. NORTHUP, St. Paul, Minn. Application filed March 29, 1873.

Claim.—1. An upright sheathing, formed of the grooved and rabbeted board A and the tongued board B, when the rabbets lap upon the board B, all substantially as described.

2. A tongue and groove for joining boards made flat on the inner and beveled or rounded on the outer side, substantially as and for the purpose set forth.

138,521.—*Governor for Steam-Engines.*—WILLIAM OED, Brooklyn, Ohio. Application filed December 27, 1872.

A valve and shell with triangular openings are operated by a toothed belt and wheel to prevent slipping of the belt. The wheel is arranged on a horizontal shaft, having a bevel-wheel on its inner end, and gearing into another on a vertical shaft, upon the upper end of which is a wide-faced pinion, which meshes into a gear-wheel on the governor-valve stem, and regulating the admission of steam by the rise and fall of the valve.

Claim.—The combination in a governor of the valve C, shell B, triangular ports *b c*, with the gearing F G, constructed in such relative proportion as described, and the toothed belt D and wheel E, all arranged and operating as and for the purposes set forth.

138,522.—*Speed-Regulator.*—GEORGE W. PARKER, Gardner, Mass. Application filed April 10, 1872.

A concavity formed in the center of a movable, rotary convex disk or pulley, whereby the motion of the machinery may be regulated or stopped.

Claim.—1. In a speed-regulator, a disk or pulley having a concavity in its center for stopping the motion of machinery, substantially as described.

2. A convex disk or pulley having a concavity in its center, and arranged to reverse the motion of the mechanism to which it is applied, substantially as described.

138,523.—*Metallurgic Furnace.*—GEORGE PERRY and JOB WEBB, Chicago, Ill. Application filed March 11, 1873.

The fire-place communicates with the body of the furnace by means of a return-flue, in which blasts of air are mingled with

the gases from the fire-place, so that complete combustion takes place in the body of the furnace.

Claim.—1. The combination, substantially as described, of a return-flue, K, and blast-pipes communicating therewith, with the body A and fire-place B of a furnace.

2. The combination of the bridge *g* and arch *f* with the bridge-walls *d* and *e*, and walls *d'* and *e'*, the whole being arranged, substantially as described, so as to form a continuous return-flue, K, communicating with the fire-place and body of the furnace.

138,524.—*Water-Indicator for Steam-Boilers.*—ALBERT P. PITKIN, Hartford, Conn. Application filed January 20, 1873.

The arrangement of the passage in pet-cock in line with that of the plug-valve permits the chamber and passages to be readily cleaned.

Claim.—The valve A, cock C, in combination with tube-holder B and passage *m*, substantially as and for the purpose set forth.

138,525.—*Manufacture of Buttons.*—CLARK M. PLATT, Waterbury, Conn. Application filed February 12, 1873.

The button is made of one piece of metal. The upper edge is flanged and folded inward, and the lower end has a bar across to hold the thread.

Claim.—As a new article of manufacture, a button made from a single piece of metal with the edge folded over, and with a cross-bar formed in the base of the hub, as described.

138,526.—*Harvester-Dropper.*—WILLIAM J. PLECKER, Bushnell, Ill. Application filed August 26, 1872.

An apron is raised from the finger-bar to serve as a cut off for the grain, while the dropper is carried to one side to deliver the gavel which has been received thereon.

Claim.—1. The combination of apron L, roller M, crank N'', rod R, cam and spring plates E and F, and disk D, substantially as and for the purposes described.

2. The combination of apron L'', roller M'', crank N, rod V, pinion U, and segment T, substantially as and for the purposes described.

3. In combination with the elements recited in the preceding claims, the platform G, arms H and H'', and universal joints K K, substantially as and for the purpose described.

138,527.—*Gate for Railway Crossings.*—JOHN B. POWELL, Philadelphia, Pa., assignor of one-half his right to EDGAR P. MICHENER, same place. Application filed September 30, 1872.

The gate, composed of jointed levers, is advanced and retracted by means of a rack and pinion. The free end is borne upon rollers. Vertical rods descend from the upper joints through eyes in the lower joints, which serve to support the gate when extended. A series of vertical rods, H, are also attached to the joints of toggle-levers, and extend through eyes on the middle joints, and serve the same purpose as rods F. The rods H and F are placed on opposite sides of the gate to give a broader base.

Claim.—1. In combination with the gate A, constructed of jointed bars A' operating after the manner of lazy-tongs, the rack-bar C and operating-pinion D, applied and adapted substantially as and for the purpose set forth.

2. The rods F, combined and operating with the jointed bars A', substantially in the manner and for the purpose specified.

3. The rods H and toggle-levers J, combined and operating with the jointed bars A', substantially as and for the purpose set forth.

4. The combination, with the gate A, of the rods F on one side thereof, and the rods H and toggle-levers J on the other side thereof, and operating together, as set forth.

138,528.—*Combined Watch-Key and Screw-Driver.*—GEORGE P. REED and HENRY B. DAY, Malden, Mass. Application filed November 16, 1872.

Within the tubular handle of a watch-key a stem or rod, forming at one end a tooth-pick and at the other a watch-screw driver, is concealed, and held by double springs. Either end of the rod may be protruded, and so held by a pin projecting through a slot in the case.

Claim.—A combined watch-key, screw-driver, and tooth-pick, formed by the combination of the case A, key B, plunger D carrying at one end the screw-driver and at the other end the tooth-pick, and springs *c* and *d*, the plunger carrying a stud, *h*, arranged to move in slots in the case A, and the whole being constructed and arranged for operation as set forth.

138,529.—*Spring Bed-Bottom.*—SAMUEL H. REEVES, New York, N. Y. Application filed February 20, 1873.

An upper and a lower surrounding-frame inclose spiral springs. The springs are fastened together at one end by loops or links, and at the other by cross-bands. At each end the springs are secured to the frames by clasps.

Claim.—The metallic spring bed-bottom or mattress, consisting of the upper surrounding-frame A, the lower surrounding-frame B, and the inclosed spiral or hour-glass springs C, the latter fastened together at one end by the loop-fastening D, and at the other end by the cross-bands E E, and both ends being secured to the said surrounding-frames, substantially as herein specified.

138,530.—*Harness.*—GEORGE RENTON, Boston, assignor to CHARLES H. ISBURGH, Melrose, Mass. Application filed March 14, 1873.

Claim.—The device shown and described, and consisting of the parts *d d' d'' d''' d''''*, constructed, arranged, and operating substantially as and for the purposes herein before set forth.

138,531.—*Barrel-Heater.*—ALSON E. SALISBURY and SAMUEL S. STEEL, Martin, Ohio. Application filed December 23, 1872.

The heater is a cylinder situated between the stove and chimney. It has a central vertical partition extending nearly to the top. As the products of combustion pass through they impinge upon the entire interior surface.

Claim.—The cylinder A, provided with the central division *a*, base B, pipes E D, stove C, and chimney F, the several parts being constructed and arranged as and for the purpose specified.

138,532.—*Ship's Lantern.*—HERBERT SAUNDERS, South Kingston, R. I. Application filed March 18, 1873.

The vertically-adjustable perforated tube is held in place by the action of a bent spring.

Claim.—The inner perforated cap F, in combination with the outer perforated cap D and spring G, substantially as and for the purpose hereinbefore set forth.

138,533.—*Cider-Mill.*—MARCUS P. SCHENCK, Fulton, N. Y. Application filed October 17, 1872.

Two feed and a crushing rollers geared together, combined with a chamber for catching stones.

Claim.—1. The feed-rollers C C, in combination with the grinding-cylinder D, hinged concave E, and separately-adjustable floor G, all arranged to operate in manner substantially as and for the purposes specified.

2. The stone-catching box I, combined with the grinding-cylinder D, as and for the purpose set forth.

3. The combination of gearing J K L L with the cylinder D and feed-rollers C C, as set forth.

138,534.—*Bottle-Filling Apparatus.*—FREDERICK SCHLICH and ADRIAN FETH, New York, N. Y. Application filed July 11, 1872.

The bottles are placed in a frame made of strips of metal bent up to form the sides, and riveted to a strip forming the rim. To prevent the bottles floating when first inserted in the liquid a wire frame is placed over them in such position that, as the handles of the frame are grasped by the hands of the operator, the thumbs can be placed upon the frame, which rests upon the necks of the bottles.

Claim.—A bottle-filling apparatus, consisting of a frame or stand for holding the bottles, combined with a movable wire frame for keeping the bottles in place and handles for lifting the stand, located so that the operator can simultaneously hold down the frame *i*, as set forth.

138,535.—*Car-Brake.*—JAMES SHANNON, Cohoes, N. Y. Application filed February 28, 1873.

Beneath the frame of the truck is arranged a shaft carrying a bevel-spur gear upon one end and a worm-gear upon the other end. When the spur-gear wheel is thrown into gear with a spur-wheel attached to the axle, the worm-gear engages with a gear-wheel which is secured to the brake-shaft and revolves the latter, thereby winding up the brake-chain very tightly.

Claim.—1. The shaft D, pinion G, and worm H, in combination with the wheel C, (attached to the axle *b*,) worm-wheel J, and shaft I, when constructed substantially as herein described, to operate the brake-blocks K K, as and for the purpose specified.

2. The combination of the shaft P, having the cross-bar Q and rods R R, with the shaft D, having the cross-bar *d*, as and for the purpose specified.

3. The check-plate S and spring-bolt T, or their equivalents, in combination with the shaft D, as and for the purpose specified.

138,536.—*Harvester Attachment for Dumping and Shocking Sheaves.*—WILLIAM A. SHARP and CHARLES L. MCCLUNG, Tama City, Iowa. Application filed October 28, 1872.

A conical receiver is mounted upon a shaft supported on the rear of the binder's platform. The sheaves are placed therein with heads downward, and, when filled, the receiver is turned by means of a crank, and the sheaves deposited in a compact form upon the ground.

Claim.—The hopper D, shaft E, bearing F, standard G, crank *e*, and handle *f*, in combination with the binder's platform A, substantially as and for the purpose herein before set forth.

138,537.—*Seat for Vehicles.*—ALFRED B. SHEAFFER, New Holland, Pa. Application filed November 12, 1872.

The front seat can be thrown both forward and backward. The hind seat can be thrown forward over the front seat, and both seats can be taken off without removing the sill-fastenings.

Claim.—1. The sill-plates A, sliding or hinged clamp-plates B, slotted and wedge-shaped heads *b* held together by a binding-screw, D, in combination with the hinged seat-supports F, all combined and constructed substantially in the manner specified.

2. The double-acting lever O with its spring S, in combination with the connections P, adjusting-screw Q, and sliding case R with its prop I and fixed guide-bolt T, all combined and to operate substantially in the manner and for the purpose set forth.

138,538.—*Toilet-Stand.*—DANIEL SHERWOOD, Lowell, Mass., assignor to E. P. WOODS, DANIEL SHERWOOD, and C. H. LATHAM, same place. Application filed January 6, 1873.

The stand is made of wound wire bent into the required form, and the hoop or frame is provided with a glass or other receptacle. The upright support or hanger is for suspending articles.

Claim.—As a new and improved article of manufacture, a stand or holder made of wound wire, constructed substantially in the manner and for the purposes described and specified.

138,539.—*Excavator.*—AMROY B. SMITH, Denison, Tex. Application filed March 22, 1873.

The earth is thrown into one end of the revolving cylinder by the excavator-plow, and is carried to the other end by the internal screw. It is passed out periodically by means of the lever and clutch, by which the head is operated.

Claim.—1. The combination of the cylinder A, provided with a suitable screw, S, with the plow H I and frame B C E F D, as and for the purpose set forth.

2. The combination of the cylinder A, constructed as set forth, with the plow H I, the plate *b*, clutch-cylinder L M, clutch attachments N X O, and lever P, as and for the purpose specified.

138,540.—*Belt-Lacing Needle.*—JOHN W. SMITH, Bryan, Ohio. Application filed March 15, 1873.

The needle is made of three flat pieces of metal secured together, the center one being the shortest, thus forming an open eye. One of the outside pieces has barbs or flukes, over which one end of the strap is secured, and the other outside piece acts as a spring to hold the strap in the slot or eye.

Claim.—The combination of the bars A A^1, spring-bar A^2, and barbs *a*, substantially as and for the purpose set forth.

138,541.—*Scoop for Raising Sunken Coal.*—ROBERT STILES, Cincinnati, Ohio. Application filed April 2, 1873.

Claim.—The chain-sack E, in combination with the metal scoop-frame A, serrated edge *a a*, bail B, socket C, and handle D, constructed and arranged to operate as and for the purpose set forth.

138,542.—*Combined Shears and Button-Hole Cutter.*—ALFRED SWINGLE, San Francisco, Cal. Application filed December 23, 1872.

The blades are stamped out of sheet metal, and the eyes or bows are then strengthened by swaging a layer of sheet-silver, or some other metal, around them. The portion of the cutting blades which is nearest the pivot has a different angle from the other portion of the main blades, so as to provide a suitable point for cutting whalebone without dulling the blades proper. A button-hole cutter is formed between the bows and the fulcrum-pivot. One of the blades and also a gage are both adjusted by the same set-screw.

Claim.—1. As a new article of manufacture, scissors or shears, the two parts of which are stamped out of sheet metal, and the rings of which are finished and thickened by a partially-surrounding thickness of sheet metal, substantially as above described.

2. The permanent blade *d*, in combination with the attached movable blade *g* and slotted gage-plate K, both adjusted by the same screw, substantially as and for the purpose above described.

3. Providing the cutting-blades of scissors or shears with a short portion, *e*, next to the pivot, which has a slightly-opposite angle from the outer portion of the blades, substantially as and for the purpose described.

138,543.—*Range for Cooking and Heating.*—STEPHEN TRETS, New York, N. Y. Application filed January 23, 1873.

There are numerous tubes or flues extending up from the fire-pot to carry off the products of combustion. All the parts of the range are arranged to secure perfect combustion and the full advantage of the heat.

Claim.—An elevated-oven heater-range in which the series of heating-tubes *a* occupying the entire length of the range, opening above and at the rear of the fire-pot D, and without being deflected downward extending to and opening into the oven-chamber B, the air-heating flue A occupying the entire length of the range, opening at the bottom around the entire rear and side surfaces of the fire-pot D, inclosing the heating-tubes *a*, and passing upward at the rear end only of the oven-chamber B, together with the oven-chamber B, the oven C, one or more, the smoke-pipe E, and the hot-air pipe F, are all combined and operated substantially as specified.

138,544.—*Tilting Chair.*—EDWIN N. TUTTLE, Fitchburg, Mass. Application filed February 12, 1873.

The seat-frame and the lower or pedestal frame or bar are connected by a pivot near the rear ends, and one or more U-shaped springs are arranged near said pivoted connection, which keep the front of the seat down upon the bearing of the lower frame or bar.

Claim.—The pivoted bars A and D, in combination with one or more U-shaped springs, *h*, for the purpose specified, all constructed substantially as described.

138,545.—*Brush-Machine.*—EDWIN D. VAN HORN and CHESTER N. FARR, Philadelphia, Pa. Application filed March 14, 1873.

Above the operating mechanism is a reservoir, into which is placed a quantity of bristles, resting on a movable bottom. A needle-shaped separator enters the mass of bristles and separates from the lower part the required quantity for a tuft. The portion thus separated is seized by a pair of nippers, which, as they advance toward the front of the machine, push back the movable spring-bottom of the reservoir and deposit the bristles on a bed in advance of a carrier, which advances, pushing the bunch of bristles before it, and deposits them on a shuttle, which moves in a direction at right angles to the carrier, and passes the tuft through a loop of wire to its center. The tuft is now above the needle and the hole in the brush-block, a punch descends and strikes the tuft in the center, doubles it up and forces it into the hole in the brush-block, which is brought into a proper position by a feeding-stud. A spring-wiper slips upward over the tuft and straightens up the bristles after the fastening operation is completed.

Claim.—1. The combination with the reservoir A of a sliding bottom, B, acted on by a spring.

2. The said sliding bottom B, rendered vertically adjustable upon the reservoir, for the purpose specified.

3. The combination of the concave or recessed portion *d* of the separator D with the upper jaw of the nippers.

4. The combination of the spring bottom-plate B of the reservoir with the lower jaw of the nippers.

5. The separator D, operated substantially as described through the medium of a projection, *c*, of the nippers.

6. The carrier G, consisting of a series of parallel bars caused to reciprocate simultaneously beneath the reservoir, substantially as and for the purpose described.

7. The jointed ends or plates h of the carrier-bars, adapted to grooves in the bed-plate and operated by shoulders within the said grooves, substantially as herein set forth.

8. The combination, substantially as described, of the nippers E with the carrier G.

9. The combination, substantially as described, of the arm c^3 of the nippers with the inclines *f* of the carrier.

10. The combination of the reservoir A, the carrier G, and the shuttle-race, all arranged, in respect to each other, substantially as described.

11. The shuttle H H', constructed in two separate sections, substantially as and for the purpose described.

12. The combination of the shuttle, its race, and the jointed ends h of the carrier, all arranged and operating, substantially as described, to prevent the escape or disarrangement of the bristles during their transfer from the said carrier to the shuttle.

13. The section H' of the shuttle, constructed substantially as described, with a nose, *k'*, and a hinged portion, *k*, acted on by a spring.

14. The combination of the sliding bar R with the hinged portion *k* of the shuttle.

15. The combination of the cam-like projection A with the said hinged portion of the shuttle.

16. The combination and arrangement, in respect to each other and the shuttle, of the sliding bar R and cam projection *n*.

17. The combination, substantially as described, of the punch J and needle I with the divided shuttle.

18. The punch J and needle I, arranged in respect to and operating in conjunction with each other upon the bunch of bristles, substantially as described.

19. The wiper L, constructed and operating substantially as described.

20. The feeding device, consisting of the yielding stud K and bar *k'*, in combination with a cam on the driving-shaft or equivalent operating mechanism.

21. The shuttle-driver Q, adapted to the exterior of the shuttle-race, connected to the two sections of the shuttle through a slot in the said race, and operated as described by a lever, *m'*, through the medium of a link, *m*.

22. The take-up lever S, arranged and operating in combination with the needle I, substantially as specified.

138,546.—*Organ-Lever Coupling for Hydraulic Motors.*—HENRY F. WHEELER, Boston, Mass. Application filed July 3, 1872.

The piston-rod of the motor, which is designed for operating the bellows of an organ, is made in two parts, connected together by a coupling-box, there being in the box a rubber cushion between the two parts of the piston-rod, and another cushion made as a ring, through which one part of the rod passes, so that as the piston starts on its upstroke to lift the bellows-lever the first force is exerted against and compresses one of the cushions, while, when the piston starts down to draw the bellows-lever, the first or immediate strain is upon the other cushion, so that in each case the force is applied gradually to the lever without jar. The piston-rod carries an arm, which, in moving up or down, strikes a projection on the valve-rod to shift the valve. In connection with the sliding valve-rod there is employed a stationary rod provided with stops and springs. When the piston-arm strikes the valve-rod stop the piston can have a continued movement, the arm striking also the spring on the stationary arm, and permitting the piston to move on cushions by the spring until the movement of the valve is completed.

Claim.—1. In combination with the motor-cylinder and its piston-rod, the coupling-box *f* and its cushions or springs *h i*, substantially as shown and described.

2. In combination with the cylinder *a*, piston-rod *b*, valve-rod *c*, and stops *m n*, the stationary rod *o* with its stops *p q* and springs *r s*, substantially as shown and described.

3. In combination with the rod *b*, arms *k l*, and rods *c o*, the adjustable stops *n q*, substantially as shown and described.

138,547.—*Apparatus for Automatic Control of Combustion in Hot-Water and Hot-Air Heating Apparatus.*—JOSEPH C. WIGHTMAN, Newton, and JOHN H. MILLS, Boston, Mass.; said WIGHTMAN assignor, by mesne assignments, to said MILLS. Application filed February 27, 1872.

By means of a flexible diaphragm, operated by a fluid vaporized at a low temperature by heat from another fluid, the draft-damper of a furnace may be controlled.

Claim.—The automatic control of combustion in hot-water and hot-air heating apparatus by the employment of two fluids, as specified, the one to serve as a medium to receive and absorb heat from the furnace and impart it to the other, and the other, more volatile and vaporizable at a low temperature, to operate, at temperatures under 212° Fahrenheit, the draft regulation or damper of the furnace, through the medium of a flexible diaphragm, or its equivalent, and mechanism intermediate between and connecting said diaphragm, or its equivalent, and damper, each fluid being contained within a distinct vessel, and operating substantially as and for the purposes herein shown and set forth.

138,548.—*Combination Tool.*—TURNER WILLIAMS, Providence, R. I. Application filed August 26, 1872.

Interchangeable devices are made adjustable to jaw and lever, so as to provide a wrench, wire-bender, cutting-nippers, pliers, belt-punch, share-blade, or saw-set.

Claim.—The combination of the jaw A and lever B, constructed as described, with the interchangeable devices, constructed and operated as herein described, for the purposes set forth.

138,549.—*Tobacco-Press.*—FRANK J. WITOVEC, St. Louis, Mo., assignor to himself and JAMES G. BUTLER, same place. Application filed February 18, 1873.

Improvement in presses for packing cut tobacco and granular substances in sacks, consisting, first, of the arrangement of a crank operating in a slotted curved cross-head, imparting intermittent reciprocating motion to a plunger, by which the tobacco or other material is pressed in proper molds, a funnel-receiver being used, over which the sack is placed; and, secondly, of the arrangement of a rotary table, by which the molds are successively brought under the plunger, motion being communicated by bevel-gear and shafting-connections with main driving-shaft; also, the manner of affording the table sufficient brace, and likewise arrangement of forked arms to withdraw funnel from sack after pressing the material by the plunger.

Claim.—1. The crank B, its pin *b*, slotted cross-head C, plunger-stem *c*, and extension c^2, in combination with driving-shaft A', as and for the purpose set forth.

2. The combination of the table D, sleeve *d*, circular plate E having ratchets *e*, wiper e^1, shaft E', spur-gears F F', extension shaft G, bevel-gears *g g'*, driving-shaft A', and column A, operating as and for the purpose set forth.

3. The table D having holes *k*, brace I, sleeve-collar d^1, catch-lever J, its pin j^1, bracket j^2, rod j^3, spring j^4, collar j^5, wiper j^6, in combination with shaft E', spur-gears F F', shaft G', bevel-gears *g g'*, main shaft A', and frame A, as and for the purpose specified.

4. The forked-arm attachment consisting of the arm L, adjustable forks M, vibrating beam N, cam-groove pulley *n'*, in combination with driving-shaft A', as and for the purpose set forth.

5. The forked-arm attachment consisting of arm L, adjustable forks M, vibrating beam N, cam-pulley *n'*, side rods O O', adjustable cranks o^2 o^3, top shaft P, bevel-wheels *p p'*, in combination with driving-shaft A' and frame A, as and for the purpose set forth.

138,550.—*Culinary Steamer.*—HENRY WOOTTON and JOHN WOOTTON, Rochester, N. Y. Application filed March 3, 1873.

By means of two apertures in the top of the water-pan, over either of which the valve may be pushed, steam is directed into the cooking-chamber or diversed into the side exit-passage.

Claim.—The combination of the body A, its openings *c* and *g*, the vertical tube *f* with opening *d*, and the sliding valve D and its supports A A, all constructed, arranged, and operating substantially as and for the purpose described.

138,551.—*Door Check and Retainer.*—GEORGE H. WORSTER, Athol, Mass. Application filed March 19, 1873.

A metallic bracket, carrying a rubber-head stop, is cast in one piece, with latch projecting beyond the stop, and interposed between this bracket and the casing is a rubber packing or added spring. The device is combined with any suitable catch on the door or blind, and serves both as a door stop and retainer.

Claim.—The bracket D, cast or otherwise formed in one piece with the latch *b*, and provided with an elastic stop, *c*, in combination with the rubber packing or spring *c* and any suitable catch, E, when arranged, in combination with a door or blind, as herein described, for the purpose specified.

138,552.—*Sawing-Machine.*—JAMES T. BAGGS, Bridgeport, Ohio, assignor of one-fourth his right to ANDREW J. BAGGS, same place. Application filed February 21, 1873.

The saw-table is so arranged that its two sides are independently adjustable, or may be both inclined at any desired angle to the saw.

Claim.—1. The table-bearers I, vibrating arms K, eccentric N, slotted crank E, and link F, or their equivalents, when combined and arranged to produce a compound movement, substantially as and for the purposes herein set forth.

2. The combination of the table-bearers I with the adjustable leaf-bearers G and leaves A B, as and for the purpose specified.

138,553.—*Refrigerator.*—WILLIAM M. BAKER, Fortville, Ind. Application filed March 1, 1873.

Cools the air in such a manner that the same is carried dry, fresh, and cold over the provision therein.

Claim.—1. The air-spaces A between the outer sides of the refrigerator and interior sides of ice-chambers C, divided by cross-pieces *i*, in connection with the air-chambers D, apertures *k* and *l* for the free circulation of the cooled air, substantially as described.

2. The arrangement of one or more air-chambers, D, having inclined sides, for the purposes described.

138,554.—*Sifter, Mixer, and Grinder for Glass-Stock.*—GEORGE B. BARNES and JAMES A. LEASURE, Bellaire, Ohio. Application filed March 22, 1873.

Stock sifted and mixed by sieve, lumps, &c., passing over tail of sieve, ground by the rollers. Dust prevented from rising by cover.

Claim.—1. The combination of the reciprocating inclined screen D and crushing-rolls K L, substantially as specified.

2. The combination of the removable cover C and hopper N with the inclined reciprocating screen and the crushing-rollers, substantially as specified.

138,555.—*Cotton-Cultivator.*—FINIS L. BATES, Bremond, Tex. Application filed February 21, 1873.

Claim.—The spring Q attached at one end to bar G, and connected by a link at the other with the end of hoe-handle, as and for the purpose described.

138,556.—*Machine for Thrashing and Hulling Clover.*—JAMES BRADLEY and JAMES NICHOLAS, Gomer, Ohio. Application filed February 1, 1873.

Pivoted feed-board, automatically agitated, prevents the grain from lodging on the same.

Claim.—The combination of the crank K, connecting-rod L, and crank M with the feed-board J and with the roller N of the straw-carrier, substantially as herein shown and described.

138,557.—*Apparatus for Loading and Unloading Baggage and Freight from Cars.*—ORLANDO C. BROWN, Iberia, Ohio. Application filed November 1, 1872.

A frame hinged upon one end of an ordinary truck, which can be elevated or depressed by means of the lifting-jack.

Claim.—1. The combination of a track, 4, with hinge 14, fastened to frame of lower truck 2 3 7, substantially as and for the purposes hereinbefore set forth.

2. The combination of a lifting-jack, marked 10, 11, and 13, arranged in frame 3, in combination with track 4, substantially as and for the purposes hereinbefore set forth.

3. The combination of a drum-wheel, axle, and handle, 12^2, on end of track 4, substantially as described.

4. The combination of friction-rollers 6 to operate against frame 3, substantially as described.

5. The combination of the double truck with track 4 between them, to operate as described.

138,558.—*Lubricating-Cup.*—THEODORE COOPER, Warwick, R. I. Application filed January 30, 1873.

Claim.—The combination of the regulating and graduating apparatus, consisting of the spring 4, the washer 2, the nut 8, and the index 3 or their equivalents, with a reservoir and a siphon, arranged and operating substantially as shown and described.

138,559.—*Stamp for Cutting Out Figures.*—ERNEST JULIUS FISCHER, Philadelphia, Pa. Application filed November 23, 1872.

Spring-seated arms have the numerals cut in their ends, which engage hollow dies in the bed. A paper-holder, consisting of two spring-plates, is reciprocated transversely in a guide-slot.

Claim.—The improved hand-stamp comprising the platform A, pivoted arms B, having cutting-punches at the ends thereof, springs *a'*, solid plate C having counterpart dies cut therein, base-piece *d*, handle d^2, spring-plate d^3, and holder E, all constructed and arranged substantially as and for the purpose specified.

138,560.—*Carpet-Stretcher.*—JOSEPH S. GREENE and THOMAS D. BRADT, Watertown, N. Y. Application filed March 8, 1873.

The device is constructed with a block, with an angular top in which the handle is inserted. On its bottom are pointed wires to hold it to the carpet, and from the block extends a coiled-wire brace, with hooked points to hold the device to the floor for the carpet to be stretched by the use of the handle.

Claim.—The slotted socket-plate A *a b*, handle B, claw C *f*, and bristle-plate *d*, combined, constructed, and arranged as and for the purpose set forth.

138,561.—*Potato-Digger.*—GEORGE W. HAAG, Cairo, Pa. Application filed February 8, 1873.

A rectangular frame is supported upon a pair of wheels. Within this frame is situated a pair of fingered wheels, the fingers being made in sections and so operated by cams that the sets approach each other as they enter the ground, and thus lift the potatoes and deposit them upon a series of separating-rollers.

Claim.—1. The combination, in a potato-digging machine, of a pair of wheels, O, with radial oscillating prongs R and cams for working them, substantially in the manner described.

2. The combination of said prong-wheel and an elevator or carrier, *y*, substantially as specified.

3. The arrangement of the rims O, bars T, prongs R, arms U, and cams V, substantially as specified.

4. The combination of a series of fluted rollers, A', frame B', cranks C', bars D' and F', and cranks E', substantially as specified.

138,562.—*Hydrant.*—JAMES V. HAYES, Buffalo, N. Y. Application filed February 7, 1873.

To thaw the water when frozen in the hydrant, casts around the latter a jacket. The space thus formed is divided into two compartments by vertical diaphragms, which extend down through the elbow into a circular belt, which form a communication between the two. Steam from the engine is admitted into this space.

Claim.—The combination of the passage B, steam-passages *e* and *e'* divided by diaphragms d *d*, and having the inlet and outlet openings *f* and *g*, substantially as and for the purpose described.

138,563.—*Blast-Governor for Grain-Separators.*—THOMAS HOGE, Washington, D. C. Application filed March 3, 1873.

Over an opening in the air-trunk is placed a box containing a valve or piston, which is actuated by the difference of pressure of the blast and the external air. This valve being suitably connected with a balanced regulating-valve in the air-trunk, automatically adjusts the latter. A weight may be attached to the first-mentioned valve to limit its action as desired.

Claim.—A blast-regulating valve, automatically adjusted by means of another valve or piston suitably connected to it, the latter being actuated by the difference in pressure of the blast and the external air, substantially as and for the purpose described.

138,564.—*Reverberatory Furnace.*—WILLIAM HOYLAND, Newcastle, Pa. Application filed April 5, 1873.

The furnace-plates are constructed so as to be readily removed and replaced in repairing the furnace. The bottom plate

can be withdrawn through a recess formed in the side plate at the side of the opening for the breast-plate. A recess formed in the end plates permits the withdrawal of the end-wall plates. A set of bearers support the bottom plates, the bottom plates being provided with openings, which, in connection with a vertical pipe, draw air through the chills and carry off gases that accumulate under the furnace.

Claim.—1. The combination of the breast-plate P with the plate E, substantially as herein shown and described.

2. The recess e^1, formed in the plate E at the side of the opening for the breast-plate P, to enable the plate N to be withdrawn through said opening, substantially as herein shown and described.

3. The arrangement of the bearers J K L with respect to each other and the plates M N O, substantially as herein shown and described.

4. The recess formed in the end plate G for the end-wall plate Q to be drawn through, substantially as herein shown and described.

5. The combination of the pipe R with the puddling-furnace, substantially as herein shown and described, and for the purpose set forth.

6. The holes *m' o'* in the plates M O, in connection with the pipe R, substantially as herein shown and described, and for the purpose set forth.

138,565.—*Fruit-Gatherer.*—HORACE KELSEY, Ottawa, Kans. Application filed September 28, 1872.

A fruit-gatherer constructed in the form of an inverted umbrella, with ribs supported at their outer ends by uprights. The center is fastened to the tree by means of beveled blocks secured to a strap which passes around the tree somewhat lower than the outer ends, so that when the fruit falls upon the gatherer it rolls toward the center, and passes through a spout into a receptacle.

Claim.—The strap and beveled blocks E F, in combination with the flexible body A provided with the spout G, as and for the purpose specified.

138,566.—*Seal-Lock.*—JACOB KINZER, Pittsburg, Pa., assignor to himself, ROBERT PITCAIRN, DAVID M. WATT, and JOHN J. TORLEY, same place. Application filed March 3, 1873.

A hinged plate is arranged to cover the key-hole, and is held down by means of a slotted metallic seal, which must be broken before access can be had to the key-hole. A shank having a T-shaped head that passes through the slot in the seal and then partially rotated serves to hold the seal. The seal is provided with lips near its edge which lap over the edge of the lock-case and prevent its rotation. A spring locking-dog, when in the locked position, bears against an arm attached to the inner end of the T-headed shank and prevents it from being rotated. This arm also serves to hold the spring-dog in the unlocked position when the lock is open.

Claim.—1. The shank *d* having an arm, d^1, and a T-head, d^2, in combination with the swinging dog of a lock, and suitably arranged for holding the dog in an unlocked position when unsealed, and retaining, after locking and sealing, a metallic seal placed thereon, substantially as set forth.

2. A metallic seal, *r*, having an oblong slot, r^1, over which the T-head d^2 may be turned to secure it in place, and overlapping lips r^2, or other equivalent stop device to prevent its rotation, substantially as and for the purposes described.

3. The hinged lid *n* arranged to cover the key-hole, and also by a central opening, n^1, to expose a shipping-card, *q*, in combination with barbs *p* for holding the card, the non-rotating seal *r*, and T-head d^2, substantially as set forth.

138,567.—*Automatic Fan.*—JACOB LEHNER, Galena, Ill. Application filed March 29, 1873.

A frame, whose base is grooved for the cradle-rockers to rock in, has a rotary fan hung in bearings above the head of the cradle, and supported by an upright attached to the head-board. A cord from the back of the rocking-chair revolves the fan whether the cradle rock or not, which latter is determined by the connecting-rod joining chair and rocker being in or out of gear.

Claim.—1. In combination with a cradle, the casing B having segmental slot *a*, as described.

2. The support C, in connection with casing B and head-screws *b* and *d*, adjustable in the position described, as set forth.

3. The shaft *f*, in connection with pulley F and slotted head-piece D, having set-screws *g* to adjust fan E, as described.

4. The pulley F having button A, connected by string and rubber band with button *i* of rocking-chair and *i'* of support C, to convey the motion of the rocking-chair to the fan.

5. The pulley F, having buttons A connected by leather strings with buttons *l* of standards H, in combination with rod I and buttons K, to fan and rock the cradle, substantially as described.

6. In combination with rocking-chair and cradle, the detachable notched rod I, for the purpose described.

7. The frame G, having grooves for the cradle, wedges *m*, and standards H, combined as set forth.

8. The combination of the various parts mentioned in the foregoing clauses of the claim.

138,568.—*Bung-Bush Inserter.*—LOMAX LITTLEJOHN, New York, N. Y. Application filed April 5, 1873.

An elliptical journal is formed upon the end of the shank, with a split sleeve having elliptical or elongated cavity, so when inserted in the bush and the shank turned the elliptical journal will expand the sleeve, causing it to grasp the bush and screw it into the bung-hole of the stave.

Claim.—The combination of the elliptical journal B, formed upon the end of a shank, A, with the split sleeve E, made with an elliptical or elongated cavity, substantially as herein shown and described, and for the purpose set forth.

138,569.—*Dinner-Pail.*—EMIL C. LUKS, Massillon, Ohio. Application filed April 12, 1873.

An outer pail of wood and an inner pail of metal, with space between them filled with some non-conducting material. Vessels for holding food are placed inside.

Claim.—The combination of the cylinders A and B, connected at their upper ends by the ring C, and the space between them filled with non-conducting packing D, the lid E, with lining *a*, cover G, and interior food-receptacles J J, all constructed and arranged substantially as and for the purposes herein set forth.

138,570.—*Drilling-Machine.*—HENRY MARTIN, Duncan, Pa. Application filed February 21, 1873.

Claim.—The tube A, slotted plate B C, arm E, end-socketed centering-screw F, sliding head-block H, and screws G K L, combined as described, said parts being put together and taken apart, as set forth, so as to make an easily-portable hand-drill.

138,571.—*Extension Table.*—SAMUEL H. MARTIN, Mount Vernon, N. Y. Application filed March 8, 1873.

The transverse slats of the table-top are hinged together, and also connected by metallic chains, and the combined flexible top coils around a flanged octagon shaft arranged near one end of the table. To the under side of the under end of the table is attached a slot-plate, in which rods attached to the ends of the chains slide back and forth.

Claim.—1. An extension table having a flexible top, F, chains G G, octagonal shaft D, and flanges H H, arranged to operate substantially for the purpose described.

2. In combination with the chains G, the slot-plate J, as shown and described.

138,572.—*Horse Hay-Fork.*—DE WITT C. MCDONALD, Rushford, N. Y. Application filed March 22, 1873.

A hoisting lever or bail is pivoted to the sides of a scoop-shaped fork, the tines of which are braced in a horizontal position for hoisting, and allowed to drop to a vertical position for discharging.

Claim.—A horse hay-fork formed of the tines A, (two or three,) the rigid shank B, the pivoted draft-bar C provided with the notch *c'*, the pivoted brace-bar E, the trip-lever F pivoted to brace-bar, the chain G, and the trip-coord H, constructed and arranged to operate in connection with each other, substantially as herein described.

138,573.—*Picket-Fence.*—WILLIAM MOST, Greenville, N. J. Application filed August 12, 1872.

The rails are mortised endwise into the sides of the posts. An iron bar secured to the edge of the rail passes through the post. Where a gate occurs this bar is bent back on itself and its end secured to the post, and in like manner with the gate itself, so that vertical holes being drilled into the loops of the bars a rod is passed through them to form the hinge.

Claim.—1. The means, substantially as shown and described, for securing sections of a fence to each other and to the posts C, viz., the combination of the bars F, recesses *a*, plate G, and pickets E inserted in the holes and sockets *b c*.

2. The gate-hinges, formed by bending one end of the connecting and bracing plates H H, respectively, into the form shown at *d e*, in combination with the bolts I, substantially as shown and described.

138,574.—*Can-Filler.*—ROBERT NEWTON, Millville, N. J. Application filed April 5, 1873.

Below the hopper is a vertically-movable rest for the can connecting with the lever working the plunger. When the plunger begins to act the can is raised up to the nozzle to discharge the tomatoes into it. A self-closing valve is arranged in the hopper to prevent the escape of tomatoes during the changing of the cans, the waste passing through a grating over which the filled cans are passed along in being delivered from the machine.

Claim.—1. The hopper C, chamber G', valve E, collar P, lifter R, and an actuating-lever combined and arranged for filling cans with tomatoes, substantially as specified.

2. The receptacle Y, chute U, and slotted table H, combined with the can-filling apparatus described in the foregoing claim, substantially as specified.

138,575.—*Tooth for Cotton-Gin Saws.*—THOMAS B. OGLESBY, Hempstead, Tex. Application filed August 13, 1870.

The teeth are square in the rear and on the same plane with the sides of the saw-plate; in front beveled on both sides, with a central plain surface—that is, having three surfaces in front.

Claim.—A tooth for cotton-gin saws, having the front beveled on the sides *a a*, and flattened on the center *b*, as and for the purpose specified.

138,576.—*Wash-Boiler.*—JOHN R. PENDELL, Dryden, N. Y. Application filed March 6, 1873.

The boiler has a perforated tube in the center, with a perforated false bottom. A pan fits into the top of the boiler, having a tube in the bottom that sets in the tube of the boiler, and has a graduated faucet connected with it. The pan has guards to protect the hands from the steam in lifting the pan from the boiler.

Claim.—1. The combined arrangement and construction of the steamer *e*, lower pan *c*, tube *d*, upper pan *f* with beveled sides, the graduated faucet or tubular aperture *i*, and guards A, substantially as and for the purpose set forth.

2. The upper pan *f*, combined and arranged as described, with guards A and double tubular faucet *i*, graduated as described, all as set forth.

138,577.—*Loading Railroad Flat Cars.*—GEORGE W. PENNISTON, North Vernon, Ind. Application filed September 5, 1872.

The manner of binding bales upon a flat car. Dispenses with stakes and uses refuse hoops.

Claim.—The mode of fastening or securing bales of hay or other materials to cars by means of flexible hoops secured to the car and passing around the bale, substantially as described.

138,578.—*Traction-Wheel.*—CHARLES H. PERKINS, Providence R. I. Application filed February 20, 1873.

Flat tread-blocks are so arranged, in combination with a solid wheel, as to give great amount of traction.

Claim.—1. The sectional wheel-track for traction-engines, &c., in which the several sections are combined with the wheel W, as described, and by the rotation of the wheel laid tangentially in front of the same for a track, and afterward taken up in the rear and carried forward over the wheel to be laid in front of it again, substantially as set forth.

2. In a traction-wheel, the cogs or projections *n* interposed between the surfaces of the wheel and track, substantially as shown and described.

3. In a traction-wheel, the tie or bridge H, in combination with the sectional wheel-track, substantially as shown and specified.

138,579.—*Window.*—JOSHUA PERKINS, Danielsonville, Conn. Application filed October 19, 1872.

Claim.—A window-pane consisting of two parts, A B; one or both arranged in guide-ways to open and close, and provided with a thumb-piece for actuating them, substantially as specified.

138,580.—*Self-Closing Stop-Cock.*—JAMES PIGOT, Brooklyn, N. Y. Application filed April 5, 1873.

Two springs are connected at one end with the plug of the faucet, the one arranged to hold it to the valve-seat by means of a rod, upon which the spring works; the other arranged to close the faucet, and working against an arm attached to the movable handle.

Claim.—1. The combination of the arm F, spring E, and rod C, with the plug of a stop-cock, substantially as specified.

2. The combination of the presser-bar H, spring J, and nut K, with the plug of a stop-cock, substantially as specified.

3. The arrangement of the bar B, rod C, spring E, arm F, rod H, spring J, and nut K, with a stop-cock, substantially as specified.

138,581.—*Safety-Guard for Pocket-Books.*—THADDEUS POTTER, Jackson, Miss. Application filed March 29, 1873.

By moving the slide the hooks are made to protrude from openings in the book and pierce the lining of the pocket.

Claim.—The combination of hooks A, bar C, arm E, rod F, and slide I, with a pocket-book, substantially as described.

138,582.—*Bedstead.*—D. CHRISTIAN RAUB, St. Louis, Mo. Application filed September 13, 1872.

The corner posts are tubular and in three pieces. The side and end rails and braces are tubular, and enter the center piece of the corner posts and are held by nuts. The side rails are braced by rods running from their center to the foot of the posts. The cord runs longitudinally over pulleys, and its tension is regulated by a ratchet-wheel and pawl.

Claim.—1. A bedstead, Z, constructed of the tubular side pieces B B' C C', the tubular cross-pieces D D' E E', the posts A A A A, the rods *d*, the nuts *e*, and the braces F, substantially as and for the purpose hereinbefore set forth.

2. The bedstead Z, in combination with the pulleys G, the rope I, the pulleys L and O, ratchet-wheels T T, ratchets U U, the shaft P, and crank V, substantially as and for the purpose hereinbefore set forth.

138,583.—*Cotton-Press.*—WILLIAM H. REYNOLDS, New Orleans, La. Application filed February 25, 1873.

Claim.—1. The combination of two or more outriggers, as described, upon a revolving press-box with their central parts embracing said box, and attached to the vertical rods and supporting the press-box, substantially as described, for the purposes set forth.

2. The combination and arrangement, upon a revolving press-box, of the outriggers M M and eyebolt-hinges P P mounted upon the upswinging doors H, the whole arranged and operating in connection with hooks N N to control the doors in a horizontal position, substantially as described, and for the purposes set forth.

3. The combination and arrangement, with a revolving press-box frame, of the automatic lubricating devices, all constructed substantially as described, for the purposes set forth.

138,584.—*Machine for Cutting Box-Stuff.*—CHARLES W. ROYSE, Rindge, N. H. Application filed December 14, 1872.

Rim-stuff for round and oval boxes is shaved from a block and beveled at each end for the lap.

Claim.—1. The combination, with an ordinary block-holder, B C, of the reciprocating shave-cutter F and the taperer H arranged on same slide, and operated as and for the purpose described.

2. The combination, with a carriage, K, and tool-holder I, provided with lug L, of the guide-channel M N N, constructed and arranged as described, to regulate the movement of the tapering cutter, as set forth.

3. The combination, with the cutter H, of the plate Q, constructed and arranged substantially as and for the purpose set forth.

138,585.—*Desk.*—GOTTHARD SCHAFF and JOHN A. SCHAFF, Chicago, Ill. Application filed April 8, 1873.

At the rear of the drawers and sliding top is arranged a vertical iron rod, having a number of catches extending outward from its front side for locking said drawers and sliding top, and which is balanced upon one end of a small tilting lever, the lever having upon its other end a small upright rod, upon the top of which the cylinder-cover rests when thrown back, and thus tilts the lever up so as to raise the catches and release both the sliding top and the drawers.

Claim.—The lever *i*, rod *l* provided with suitable catches, and rod 3, in combination with a suitable cover, *c*, for operating them, substantially as set forth.

138,586.—*Wash-Boiler.*—FRANZ J. SCHIRMAYER, Milwaukee, Wis. Application filed April 5, 1873.

The wash-boiler is constructed with valves on the bottom of the washing device, and are connected for closing and opening by a rod and crank attached to the bottom of the boiler. The rod passes up through the water-passages and a funnel-shaped opening at the top outside and above it.

Claim.—1. The wire rods *b* having lugs *c* and rings *d*, in connection with levers E pivoted to arms *b*, and bottom hinges *i*, operating as and for the purpose described.

2. The hot-water passages D, extending to the top of boiler, having funnels *a* and bottom projections *m'*, in connection with the straight sides of cover F, as set forth.

3. The false bottom B having apertures *l*, with pivoted wing-pieces G and stripe F, substantially as described.

4. The combination of the parts of the foregoing clauses with boiler A, substantially as and for the purposes described.

138,587.—*Apparatus for Making Confectionery.*—WILLIAM H. SEIDENSTRICKER, Hagerstown, Md. Application filed November 21, 1872.

The table on which the batch of candy is worked into sticks is provided with a steam-chamber, whereby the condition of the batch is regulated and prevented from becoming sticky or brittle.

Claim.—The combination of the boiler A, connecting steam or hot-air pipes G and J J, and steam-chamber K, when constructed and arranged as herein described, and for the purposes set forth.

138,588.—*Furnace for Steam-Boilers.*—CHARLES D. SMITH, Chicago, Ill. Application filed March 11, 1873.

The metallic lining, arranged at an angle with the boiler, reflects and assists in radiating the heat. The combustion of the gases is induced by currents of heated air introduced about the center of the combustion-chamber through tubes provided with registers to regulate the amount of air admitted.

Claim.—1. A regulator or register for governing the amount of air necessary to be admitted into the flue, ash-pit, or combustion-chamber to insure good combustion of fuel, gas, and smoke, in combination with pipes or tubes, substantially as described.

2. The metallic lining of a furnace, ash-pit, or combustion-chamber, in combination with pipes for the admission of air between lining and boiler, constructed and arranged substantially as shown and described.

3. A metal lining resting directly upon the masonry of a boiler-furnace, ash-pit, or combustion-chamber beneath the boiler, arranged and constructed substantially as shown and described.

138,589.—*Bed-Spring.*—F. ROLLIN SMITH, Bennington, Vt. Application filed March 29, 1873.

The end of the V-shaped spring is cut so as to form a tongue, which is bent up and presses against a slot in the slat. Each side of the tongue the spring is bent down to form a seat for the slat.

Claim.—As an improved article of manufacture the spring A, having a seat, *a*, for the slat to rest on, and one or more tongues, *d*, for holding on the seat, all formed of the end of the spring, substantially as specified.

138,590.—*Gymnastic Apparatus.*—JOHN SMITH, Philadelphia, Pa. Application filed February 10, 1872.

A convenient arrangement for lifting is made so as to have all the parts within the control of the gymnast.

Claim.—1. The bent lever F, hook E, and coiled spring G, in combination with the lifting-rod H and tube B, through which said rod passes, substantially as herein shown and described, and for the purposes set forth.

2. The hook A^3, formed upon the end of the hook A^1 of the rod H, and the slot or groove i^1, formed in the shank of the handle I at the upper side of the hook-hole through said shank, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the handle I i^1 i^2, hooked rod H A^1 A^2, lever F, hook E, coiled spring G, and tube B, provided with gudgeons C, with each other and with the cross-bar A, substantially as herein shown and described, and for the purpose set forth.

138,591.—*Plane.*—J. CEVILLE SPENCER, Phelps, N. Y., assignor to himself and FRANCIS X. GERVIS, same place. Application filed March 1, 1873.

The plate for closing the throat of the plane is regulated by a key-rod, fulcrum-lever, and thumb-screw.

Claim.—1. The combination of the bolt F, hand-nut G, and fulcrum-collar H with the plane-stock A and adjustable plate D, substantially as herein shown and described.

2. The combination of the perforated and notched stationary plate I, toe *f'*, and forked lever J with the plane-stock A, adjustable plate D, bolt F, and nut G, substantially as herein shown and described.

138,592.—*Wood-Screw.*—JAMES K. STOCKTON, New York, N. Y. Application filed April 12, 1873.

A triple-threaded screw with conical point, each thread being triangular in section, the lower side being perpendicular to the core and the upper side slanting downward.

Claim.—The hammer-driving screw A, having triple triangular threads, slanting and rectangular to the core, with conical point, substantially as and for the purpose described.

138,593.—*Wind-Wheel Power.*—ISAAC STRAUB, Kenton county, Ky. Application filed March 14, 1873.

Two or more wind-wheels arranged upon independent towers, and connected by gearing to vertical shafts extending downward, and connected to a driving or power-transmitting shaft common to all, any one of which may be detached from the common shaft without interfering with the others by clutch-couplings.

Claim.—In combination with a series of wind-wheels, arranged upon independent towers, and a driving or power-transmitting shaft common to all the wind-wheels, connecting and disconnecting mechanism whereby any one of the series may be attached to or detached from the common shaft without interfering with the others, substantially as described.

138,594.—*Cistern-Strainer.*—NICHOLAS G. THOMAS, Ringgold, Tenn. Application filed March 13, 1871.

The rod to which the diaphragms are attached bears against the cover, thus preventing their being forced out of their proper position by the action of the water. The rod also affords a convenient means for withdrawing the filter proper from the case upon removal of the cover.

Claim.—The combination of the diaphragms B D, lugs *b b*, stem C, cover X, hooks *n n*, and catches *l l*, with the case A, as and for the purpose specified.

138,595.—*Shirt Button and Stud.*—JONATHAN T. THORNTON, Providence, R. I. Application filed October 7, 1872.

The button is constructed with two arms, one of which is double, and is combined with a disk which revolves in a flange on the under side of the face-plate. The other arm is pivoted to the double one, and has a lock or projection which renders the button attachable or detachable when it is brought to a slot made in the flange.

Claim.—The swivel *a*, in connection with arm C and in combination with the double arm B and front plate A, substantially as herein described, and for the purpose specified.

138,596.—*Cotton-Chopper.*—WILLIAM C. TILTON, Spring Place, Ga., assignor to himself and HENRY DIETON AND SON, Philadelphia, Pa. Application filed November 19, 1870.

A revolving shaft provided with a series of adjustable chopping-blades and suspended on a frame.

Claim.—The combination of the driving-wheels d^3, bands or chains *f*, the revolving adjustable cutters, and adjusting-lever H, substantially as described.

138,597.—*Washing-Machine.*—ABRAHAM VAN ALLEN, Freeport, Ill. Application filed January 28, 1873.

A washing-machine constructed with a series of conical rolls covering the entire surface of the bottom, their outer ends attached or pivoted to a hoop and the inner to the center, in which journal for the driving upright shaft is connected with a rubber having corrugations forming triangles radiating from its center.

Claim.—The washing-machine, constructed substantially as described, having for its lower disk or rubber the stationary system of revolving conical rollers *a a a*, the hoop *b* or its equivalent, the center block *c* with its center upright shaft or journal, and their necessary connections, all substantially as described, and for the purpose set forth.

138,598.—*Wagon-Seat.*—JESSE WINECOFF, Lavansville, Pa. Application filed March 3, 1873.

The seat is supported by pulleys upon swinging rods.

Claim.—The curved rods 1 1, the seat-carriers with pulleys 2 2 2 2, and the pivoted coupler 3, in combination with the slatted seat 4 4, substantially as set forth.

138,599.—*Crow and Tamping Bar.*—ALLEN WRIGHT and ALVIN F. TAW, Westfield, N. Y. Application filed November 16, 1872.

The bar is hollow and screw-threaded at the point of attachment for the tool. The objects of the hollow handle are lightness, larger circumference for a good grasp thereon, and the greater surface for distributing the vibratory reaction, which is injurious to the operator's hand.

Claim.—A crow, claw, or tamping bar, with a tubular handle, A, the two being detachably connected together, substantially as specified.

138,600.—*Piano and other Stools.*—ROBERT W. ARCHER, Rochester, N. Y. Application filed December 10, 1872.

The standard is provided with a cap-piece, which fits in an open socket in said standard, thereby embedding the nut through which the elevating-screw runs, and forming an upper support for the screw-shaft and an ornamental top to the standard.

Claim.—The standard B of a piano or other stool constructed with a cap-piece, D, which fits within an open socket, thereby embedding the nut *a* through which runs the elevating-screw C, and forming an ornamental top complete with the standard, as shown and described, for the purpose set forth.

138,601.—*Lamp-Burner.*—LEWIS J. ATWOOD, Waterbury, Conn., assignor to the PLUME & ATWOOD MANUFACTURING COMPANY, same place. Application filed February 24, 1873.

The vapor-chamber, wick-tube, and ratchet slide vertically, being guided by the columns which support the cone and by the lower part of the vapor-chamber, which fits closely in the screw-cap. A spiral spring holds the parts in position for use.

Claim.—1. A vapor-chamber, *n*, rising above the burner-screw *a*, and in which the flat wick hangs freely, in combination with a wick-tube, *s*, at the top of the vapor-chamber *n*, substantially as and for the purposes set forth.

2. The vapor-chamber *n*, sliding vertically through the burner-screw *a*, and provided with the ratchet-case, wick-raisers, and wick-tube, substantially as specified.

138,602.—*Galvanic Battery.*—LOUIS BASTET, New York, N. Y. Application filed November 18, 1872.

A solution of the nitro-hyposulphate of soda in water is used for the outer or positive fluid, dispensing with amalgamation of the zinc plate or cylinder. sulphate of copper with nitrate of soda in diluted sulphuric acid being used for the interior or carbon fluid.

Claim.—1. An alkaline nitrate, a copper sulphate, and sulphuric acid, united to form the negative, combined in a porous-cell carbon-battery with the nitro-hyposulphate of sodium for a positive, as described, to enable the zinc to be used without amalgamation.

2. The application of a nitro-hyposulphate of sodium or potassium to electric batteries, as and for the purpose described.

138,603.—*Wash-Boiler.*—JAMES H. BATCHELDER and SEWELL J. SARGENT, Lincoln, Vt. Application filed March 22, 1873.

The boiler is constructed in ordinary form, with its inner device resting upon its bottom, with flange surrounding it, with partitions across its length obliquely, and with alternate ends, forming zigzag passages, and terminating at each conducting-spout, and with an opening on its side, covered on the upper side with perforated cover.

Claim.—1. The arrangement of the central oblique partition *c*, extending entirely across the length of the base, and the oblique partitions *d*, attached to the circumscribing flange *e* at alternate ends, forming on each side of the central partition a continuous zigzag passage, *e*, leading independently to each spout, as shown and described.

2. The combination, with the spouts C and transverse passage A above the base-plate B, of the separate passages *s* below the base-plate, leading, respectively and independently, to said spouts, substantially as specified.

138,604.—*Churn.*—JOHN BECKLEY, Stiles, Iowa. Application filed March 14, 1873.

A perpendicular cylindrical churn. An interior skeleton frame, carrying a series of perpendicular perforated inward projections or abutments, against which revolving curved and perforated dashers throw the cream as they revolve, their spindle being centrally stepped at bottom, and at top its square end passing into the operating-pinion.

Claim.—The combination, with the churn-box A, of the skeleton-frame, composed of the vertical bars C C with perforated flanges G' G', rings B B, and cross-bars D D, and the shaft E with radial perforated wings G G, all operated substantially as set forth.

138,605.—*Fruit-Basket.*—STEPHEN D. BEDELL, New York, N. Y. Application filed March 15, 1873.

A basket formed from splints crossed obliquely, with a supporting-hoop crossing in, and over, and between the splints, secured by nails or rivets near its center.

Claim.—A fruit-basket, constructed of a bottom, A, rim or upper hoop C, upright standards, stays, or splints B, and of a hoop, D, placed between the outer and inner layers of uprights or splints B, substantially as and for the purpose described.

138,606.—*Tobacco-Cutting Machine.*—NICHOLAS H. BORGFELDT, New York, N. Y. Application filed April 16, 1873.

The grooves are so formed as to leave cutting-edges, which are arranged to engage on one roller with those on the other roller, the cut material being discharged from the grooves, and the rollers being adjusted by a set-screw.

Claim.—The combination of two rollers, B, each of which is provided with a series of cutting-edges, *a*, and intervening curved grooves *b*, the cutting-edges of one roller being set up against those of the other by a set-screw, E, and the curved grooves serving to facilitate the discharge of the cut material from the rollers, substantially as set forth.

138,607.—*Steam-Generator.*—NATHAN P. BRIGHTMAN, New Bedford, Mass. Application filed February 21, 1873.

A conical coil of pipe is placed in the upper part of the fire-box, the lower end communicating with the water in the lower part of the boiler, and the upper end projecting into the steam-space. The upper part of the fire-box is conical, but the distance between its sides and the coil increases toward the top, where a plate is placed to deflect the heat.

Claim.—1. The combination and arrangement of a conical spiral coil of pipe within the furnace of a steam-boiler, the lower end of the coil being connected to the lower part of boiler, and the upper end passing through the crown-sheet, and terminating in the steam-space of the boiler, substantially as and for the purpose set forth.

2. The combination of said conical coil of pipe, in the manner described, with the furnace of a steam-boiler, the walls of which are coned with less taper than that of the coil of pipes, so that an annular expanding space is left between them, substantially as described, for the purpose specified.

3. The combination of the coil, arranged within the furnace of a steam-boiler, with the hood or deflector placed near the apex of the conical coil to deflect the heat and flames, and prevent their direct exit through the smoke-stack, substantially as described.

138,608.—*Button-Fastening.*—ANTON BROCKMANN, Chicago, Ill. Application filed March 28, 1873.

Claim.—The metallic washer and elastic bell-shaped washer C in connection with the button or stud A having the toggle *b* pivoted in its slotted shank *a*, substantially as shown and set forth.

138,609.—*Billiard-Table.*—EMANUEL BRUNSWICK, Chicago, Ill. Application filed February 27, 1873.

A drop-shelf is let into the side or end of the billiard-table to hold a small package, hat, &c., during play. A modification is a semicircular shelf pivoted to the under part of the table, and sliding out like a chalk-cup.

Claim.—A billiard-table, when provided with a movable shelf, constructed and arranged substantially as and for the purposes specified.

138,610.—*Wardrobe-Bedstead.*—JAMES BYRNES, Chicago, Ill. Application filed February 27, 1873.

The folding bedstead is combined with a wardrobe that folds up, which is located above the case that incloses the folded bedstead.

Claim.—In a combined folding wardrobe and folding bedstead, the piece B hinged to the wardrobe, in combination with the folding piece E, a folding bolster, rails, or side pieces, C and D, and suitable legs or supports, all substantially as specified.

138,611.—*Corner-Piece for Picture and other Frames.*—THOMAS CALLAHAN, Brooklyn, N. Y. Application filed March 15, 1873.

Claim.—A corner-piece for the frames of pictures, window-screens, and the like, composed of a thin web, *a*, and flanges *b* and *c*, extending along the edges of the same, substantially as set forth.

138,612.—*Straw-Stacking Attachment for Thrashing-Machines.*—WILLIAM CARR, Yellow Springs, Ohio. Application filed January 29, 1873.

A series of windlass-drums are arranged so as to be placed in connection with the beater-shaft of the thrashing-machine by means of a slip-belt or movable clutch. From these windlasses proceed ropes to a traveling carrier, from which depends a double fork or grapnel, which serves to grasp a bunch of straw, raises it to the proper height, conducts it to the point from which it is desired to drop it, and there to release the bunch. This traveling, grasping, and releasing apparatus is suspended from and guided by a tight rope attached to suitable sheers, which, for the sake of convenience, are made in sections.

Claim.—1. The straw-stacking attachment for a thrashing-machine, consisting of counter-shaft driven from the beater-shaft or other moving member of the machine, loose drums I and J, clutch and ratchet, as and for the purpose set forth.

2. The sheers P P' P'' P''', each formed of two or more separate members united by joint *p p' p'' p'''*, as explained.

3. The combination of the counter-shaft driven from the beater-shaft, the loose drums I and J, clutch G, carrier T, self-releasing catch, and double fork or grapnel, all arranged to operate substantially as and for the purpose set forth.

4. The described combination of carrier T, ropes W W', trackcables S, pulleys V V' V'', sheave X, and block-pulley Y, for the purpose designated.

5. The described combination of grapnel *a a'*, strap *b*, and trip-catch *c d*, ring *e*, for the object stated.

138,613.—*Method of Engraving Bank-Note Plates.*—GEORGE W. CASILEAR, Washington, D. C.—Case B. Application filed March 29, 1873.

Impresses two letters at a time on the plate, and in constructing a word makes the impression of the last letter the matrix of the next succeeding letters taken from the roller.

Claim.—The method herein described of engraving names and titles upon bank-note plates, &c., by means of a roll or rolls having a compound alphabet produced upon its periphery, and operated substantially in the manner hereinbefore fully set forth.

138,614.—*Method of Engraving Bank-Note Plates.*—GEORGE W. CASILEAR, Washington, D. C.—Case A. Application filed March 29, 1873.

Impresses in the operation one letter at a time on the plate.

Claim.—The method herein described of engraving titles and words upon bank-note plates by means of a roll having a partial or complete alphabet produced upon its periphery, as described, and operated substantially in the manner herein set forth.

138,615.—*Draft-Cock for Soda-Fountains.*—WILLIAM P. CLARK, Medford, Mass. Application filed February 27, 1873.

Liquid is admitted to the cock through a tube with strainer. The mouth of the cock has two outlets, one of which breaks the force of the current. The valve has one hole through it, and is turned from one outlet to the other, as desired, and is held down by a spring and double joint. Two stop-screws prevent the stem turning too far. A cock on the tube closes the tube when the main cocks are to be repaired.

Claim.—1. In combination with the valve c^2 having the single passage p^2, the valve-seat having the two passages *t u*, the passage *l* leading into the arm w^2 and thence into and through the tube *y*, and the passage *u* leading into the arm s^2 and from the top of said arm, substantially as shown and described.

2. The combination of the valve-coupling c^2, spring f^2, and joint h^2, and the spindle g^2 and valve c^2, combined and relatively arranged, substantially as shown and described.

3. In combination with the valve c^2, the forked spindle g^2, tubular spindle w^2, and connecting-pin o^2, substantially as shown and described.

4. In combination with the spindles m^2 g^2, the slot q^2, stop-pin o^2, and stops r^2, substantially as shown and described.

5. In combination with the stop-pin o^2, the adjustable stops or screws s^2, arranged substantially as shown and described.

6. In combination with the arm *b*, the chambers *h i* and strainer *k*, substantially as shown and described.

7. In combination with the arm *b* and draft-cock, the shut-off or disconnecting valve x^2, arranged substantially as shown and described.

138,616.—*Spoke-Machine.*—ROBERT W. COFFER, Big Spring, Va. Application filed March 22, 1873.

A horizontally-moving table carries a pattern-spoke and a pair of centers, between which the material from which a spoke is to be formed is placed and reduced to the form of the pattern by a revolving cutter.

Claim.—1. The combination of the drum D, fuses G H, belts H' G' J^1 N, frame J, cutter-head A, sheaves J^2 J^3, shafts K M, gears K^1 K^2 M^2 M^3 P, spring K^3, and lever O, all constructed and arranged to operate substantially as described.

2. The combination of the carriages F, pattern I, guides F^2, springs F^3, rest I', frame J, and cutter-head A, all constructed and arranged to operate substantially as specified.

138,617.—*Swaging-Machine.*—HENRY M. CRIPPEN, Bartlett, assignor of one-half his right to JAMES C. WILSON, Plymouth, Ohio. Application filed February 1, 1873.

A series of dies, arranged side by side on a bed, and a corresponding series of spring-swages, to be struck with a hammer, supported by a cross-head that is itself supported by springs, but which may be brought down by force applied to a foot-lever. The die-bed turns on gudgeons, and a lever, adjusted by a screw, serves to adjust the dies to different inclinations.

Claim.—1. A swaging-machine, consisting of a series of movable hammer-spring dies or swages and die-plate and die-plate bed, the former plate being made adjustable on its bed and the plate and bed being made adjustable on the bed-plate of the machine, substantially as shown and described.

2. The hammer-die bar H, guide-rods E, springs G, and treadle K, substantially as described, for the purposes set forth.

3. The removable clamp *c*, in combination with the die-plate P, as and for the purposes described.

138,618.—*Horseshoe-Calk.*—GEORGE CUSTER, Monroe, Mich. Application filed March 23, 1873.

The lug is inserted into a correspondingly-shaped aperture in the shoe and secured by welding.

Claim.—The heel-calk described, consisting of the body *a* and the central angular welding-lug *b* having parallel sides, and inclined edges forming the angular upper end *c*, and notched at the base at *z*, said lug being surrounded by the level shoulder *n*, substantially as specified.

138,619.—*Draft-Hook for Whiffletrees, &c.*—JAMES T. DODSON, Kane, Ill. Application filed April 29, 1873.

The guard is intended to ward off any obstacle that might otherwise be caught by the end of the whiffletree or the draft-hook, as standing corn, passing vehicles, &c.

Claim.—In a draft-hook for whiffletrees, the combination therewith and with the whiffletree of the guard or shield F, essentially as described.

138,620.—*Child's Chair.*—JEROME F. DOWNING, Erie, Pa. Application filed April 19, 1873.

The back is hinged so as to be let down, and the seat is double, so that it can be extended to form a crib. To the bars connecting the rockers are hinged secondary bars having casters attached. To the arms of the chair slotted projecting bars are attached, having a bar affixed to their outer ends. To this bar a table or leaf is hinged, the table being retained in a horizontal position by a spring-catch attached to the side of the chair.

Claim.—1. In combination with the frame of a child's chair, the back E, seat F, and leaf G, each connected by hinged or pivot joints in such manner as to permit of the device being used either as a chair or crib, substantially as described.

2. The back E, seat F, leaf G, rockers C C, and hinged bars D D having rollers D' D' attached, the whole being so constructed, combined, and arranged as to permit of the chair being used for the different purposes specified.

3. In combination with the upper sections *b' b'* of the arms B B of a child's chair, the bar H', slotted arms K K, thumb-screw k^3, hinged table H, latch L, and plate L', the whole being arranged to operate substantially as described.

138,621.—*Water-Wheel.*—WILLIAM C. EDWARDS, West Winsted, Conn. Application filed November 22, 1872.

At a distance of about two-thirds the width of the bucket toward the center is arranged a vertical flange or ring, and upon the upper edge of this an inwardly-projecting flange. The upper portion of the bucket projects inwardly over this flange, so that the water passing into the wheel strikes the whole surface of the bucket, and so much of it as is inclined to do so will pass through the buckets over the flange, the remainder passing through the buckets.

Claim.—In combination with a succession of buckets, L, the internal vertical ring *l* and the flange *n*, substantially in the manner and for the purpose described.

138,622.—*Steam-Pump.*—RUDOLF EICKEMEYER, Yonkers, N. Y. Application filed January 15, 1873.

Channeled pistons in opposite cylinders for steam and water, respectively, receive an oscillating motion through a hinged crank, operating a wrist-pin on the piston-rod. Two inlet and two exhaust ports opposite each other are combined with the pistons to balance them, and said ports act alternately as outlet and inlet passages. The hinged crank is combined with an adjustable fly-wheel and piston-rod with its wrist-pin, to take up any wear.

Claim.—1. The combination of the steam-cylinder, channeled piston, piston-rod, and wrist-pin with a hinged crank, substantially as and for the purpose described.

2. The channeled pistons, in combination with the opposite cylinders, a hinged crank operating a wrist-pin attached to the piston-rod, and the two channeled pistons, substantially as and for the purpose described.

3. The two inlet-ports opposite each other, and the two outlet-ports opposite each other, in combination with the channeled piston, as and for the purpose specified.

4. The channeled pistons, when so arranged relatively to the inlet and outlet ports in the cylinder that the same channels will act alternately as outlet and inlet passages, as and for the purpose specified.

5. The hinged crank, in combination with the adjustable fly-wheel, piston-rod, and its wrist-pin, as and for the purpose described.

138,623.—*Hollow Auger.*—OZIA ALVIN ESSIG, Canton, Ohio. Application filed February 19, 1873.

The washers to suit the different sizes of tenons are held in position by the bar of the cutter, which is retained by a screw.

Claim.—The combination of the bit C, formed with a cutter, *m*, and bar *f'*, and the washer D in a hollow auger-head, A, all as and for the purposes set forth.

138,624.—*Felly-Plate.*—CHARLES D. EVERETT, Cleveland, Ohio. Application filed March 21, 1873.

A swell is formed on the plate, and is embedded in the felly, thus dispensing with a nut. The bolt passes through the felly-joint, one-half being in each end of the felly, tending to prevent lateral displacement.

Claim.—In combination with the fellies A A and tire B, the plate C with its embedded swell *a*, provided with female screw-thread and single bolt D, the bolt passing through the joint of the fellies and into the swell *a* and plate C, substantially as and for the purposes herein set forth.

138,625.—*Surfacing-Plane.*—GEORGE E. FRANKLIN, Natick, Mass. Application filed March 8, 1873.

The two cutting-irons are at right angles to each other, and the depth of cutting is regulated by a fence on the side. The ends of blocks are surfaced by this plane.

Claim.—1. The surfacing-plane, formed with two cutters, *d* and *e*, having their edges in line, and standing one in horizontal and the other in vertical position, combined with the gage *m* on the vertical face of the plane, substantially as described.

2. In combination with the two cutters, the clamp *h*, for holding the cutters, substantially as shown and described.

3. The clamp, formed with the shoulder *i*, for pressing the cutter *e* down to the cutter *d*, substantially as shown and described.

138,626.—*Soldering-Furnace.*—JOHN A. FEY, Jersey City, N. J. Application filed March 21, 1873.

The cups that hold the cans are made of copper, and attached to an iron base extending into the fire-pot. The cup chambers are provided with independent dampers.

Claim.—1. The copper cup *c* as a heating-surface for the can, in combination with the cone or iron surface for transmitting the heat from the fuel to the cup and can.

2. The annular spaces *m m'*, between the fire-plate *h* and the top plate *i*, provided with independent dampers for controlling and directing the heat to the cups, substantially as described.

138,627.—*Metallic Packing for Piston-Rods, &c.*—JAMES C. FURNESS, Boston, Mass. Application filed November 11, 1872.

Metallic segments made wedge-shaped by dividing a cylinder on a plane oblique to its axis, each ring having a thin and a thick side, against the latter of which the steam acts and forces them against the piston-rods, one section sliding upon the other. Springs are provided to keep the sections in place when no steam is used.

Claim.—1. The metallic packing, hereinbefore described, formed of the two rings *a b* and *c d*, made of Babbitt metal, as stated, each ring being broken, and said rings being arranged within the packing-box A so as to break joint, as shown in Figs. 1, 2, and 3, and remain steam-tight, the entire packing being rendered effective by steam-pressure, substantially as described.

2. A metallic packing formed of two unbroken rings, made by dividing a cylinder on a plane oblique to its axis, as shown in Fig. 4, so that each of said rings shall have a thin and a thick side, as shown, against the latter of which sides the steam can act, as and for the purpose set forth.

3. The springs *z* in packing-boxes in which the Babbitt metal is to be made effective by steam to keep the pieces of metal substantially in place when not in operation.

138,628.—*Peg-Mill.*—DAVID H. GAGE, Dover, N. H. Application filed March 7, 1873.

Has a shaft provided with a fixed rack placed between two grinders. Over the upper grinder is a cleaner, arched at its center, its extremities fitted into recesses on the inner face of the cylinder, the lower grinder having on its under side a channel and sweep, the lower end of the shaft, provided with a mixer, having a curved sweep on its under side to give any resisting material a direction opposite to that given by the lower grinder.

Claim.—1. The sweep M, substantially as and for the purpose shown and described.

2. The grinder L, in combination with the sweep M and stud O, substantially as shown and described.

3. The cylinder C provided with the aperture E, in combination with the sweep M, channel N, and stud O, substantially as shown and described.

4. The sweep S, substantially as and for the purpose shown and described.

5. The grinder I, provided with the sweep M, in combination with the mixer R provided with the sweep S, substantially as shown and described.

6. The stripper T, for the purpose of cleaning the grinder I, substantially as shown and described.

138,629.—*Deodorizing Oils Obtained from Acid Tar of Oil-Refineries.*—RICHARD GAGGIN, Erie, Pa. Application filed April 3, 1873.

By treating with milk of chloride of lime, or chloride of lime dissolved in water at a temperature not higher than about 140°. After thus treating, and the limy sediment drawn off, introduce a caustic or carbonate alkali.

Claim.—The diluting and distilling of oil from acid tar and then deodorizing the same, in the manner and by the processes substantially as herein described.

138,630.—*Bed-Bottom.*—ELI K. GARRETSON and WOODARD FULGHUM, Winchester, Ind. Application filed April 1, 1873.

The slats, slotted at the ends, rest upon a pin that passes through the end of the levers, and the levers rest upon elastic blocks. The fixed end of the lever is held by staples inserted in a bar attached to the head and foot boards.

Claim.—The slats D D resting at each end upon a pin, *d*, in a lever, E, the levers E E, the lever-supporting blocks *b b*, block-supports C C, and the staples *a a a*, in combination with the bedstead, sofa, or seat, substantially as and for the purposes described.

138,631.—*Music-Leaf Turner.*—JOHN B. GEYSER, Pittsburg, Pa. Application filed January 3, 1873.

The arms end in pinions, which gear with sliders having a short rack at their center. Both ends of the sliders terminate in down-projecting fingers, against which the performer presses sidewise to turn the said arms.

Claim.—1. The combination of the dished frame or rack A with the groove B, vertical in its center, the opening C at the base of groove, and the recess D with the two lugs E E, projecting from its center, and the projections R R on the sides of the frame, together with the pivots F F and the lugs G G, or their equivalents, substantially as and for the purposes hereinbefore set forth.

2. The hooked binding-rod H, pivoted to the sliding piece I and operated by the spring J, substantially as and for the purposes hereinbefore set forth.

3. The sliding piece I having the wings *c' c'* and slot for the reception of the binding-rod, substantially as and for the purpose hereinbefore set forth.

4. The sliding rack-bars K with their extremities turning downward and outward, ending in the finger-keys L, and having the slots *m'* for the reception of the lock-bar, substantially as and for the purpose hereinbefore set forth.

5. The vibrating arms P, in combination with the latch S or its equivalent, secured to the frame by means of the screw *a'*, substantially as and for the purpose hereinbefore set forth.

6. The lock-bar N, in combination with the pin O, substantially as and for the purpose hereinbefore set forth.

7. The combination of the subject-matter of the foregoing clauses of claim, the whole forming a music rack or stand and a leaf-turner, substantially as and for the purpose hereinbefore set forth.

138,632.—*Wash-Boiler.*—WILLIAM G. GIBSON, Lynchburg, Ohio. Application filed March 7, 1873.

A wash-boiler constructed with a perforated crowning-plate with a center tube, with perforations on its upper end, partly covered with a flange. Through the center tube is a smaller one with a conical end, which serves to give direction to the water and keep it in close contact with the outer one.

Claim.—1. The combination, in a wash-boiler, of crowning-plate C, tube D *d'*, inverted trough or chute E, and perforations *e e'*, arranged and operating substantially in the manner and for the purpose specified.

2. In the described combination with the elements of the clause immediately preceding, the conical-ended cylinder F, arranged and operating substantially in the manner and for the purpose specified.

138,633.—*Packing for Pistons and Stop-Valves.*—PAUL GIFFARD, Paris, France, assignor to CHARLES JAMES ADOLPH DICK, Pittsburg, Pa. Application filed February 17, 1873.

A piston-ring, made softer at the inner than the outer circumference, of India rubber, vulcanized, and provided with or without annular bearings, is placed between the flanges of a piston to allow it to vibrate.

Claim.—1. The within-described piston-ring, made softer at the inner than at the outer circumference, and adapted to the groove of a piston, all substantially as and for the purpose herein set forth.

2. The combination of a recessed piston, a packing-ring, and one or more annular bearings, *a a*, arranged to limit the play of the ring, substantially as described.

138,634.—*Machine for Forming Boot-Heels.*—CHARLES W. GLIDDEN, Lynn, assignor to JAMES W. BROOKS, trustee, Boston, Mass. Application filed April 2, 1873.

The heel-blank is rigidly held in a revolving clamp. A wheel with peripheral serrations is brought into contact with the blank, when, both revolving, the lift-edges are solidified and rolled down until brought to a uniform surface.

Claim.—1. In combination with a clamp for holding an assemblage of heel-lifts, a wheel operating to compress the heel-lift edges and shape the heel-edge, substantially as described.

2. In combination with the clamp, the wheel having the peripheral serrations, substantially as described.

3. The combination of the rotating clamp for holding the heel-blanks with the wheel attached to the carriage *a* and moved forward by the pressure of a spring, the wheel being in inclined position and the extent of compression of the lifts being determined by the pattern-plate *d* and roll *j*, substantially as described.

4. In combination with the clamp, the wheel made adjustable as to inclination, substantially as described.

5. The improved mode of shaping the edges of boot and shoe heels, consisting in subjecting the edges of the lifts to the rolling pressure of a wheel, by means substantially as described.

138,635.—*Tuck-Marker for Sewing-Machines.*—HARRY C. GOODRICH, Chicago, Ill. Application filed October 5, 1872.

The tongues *c d* project laterally from the spring-arm, and the upper tongue overlaps the other and the elevated tongue of the plate. The material is entered over the tongue of the plate and under the other tongues, and when the latter are depressed the upper tongue first engages the cloth on the tongue of the plate, and the two then move together, holding the fabric, and crease or fold it over the edge of the tongue.

Claim.—The combination of the tongues *c d* and spring-arm D with the lip or tongue *e*, plate A, and arm or hammer C, all operating substantially as and for the purposes specified.

138,636.—*Tuck-Marker for Sewing-Machines.*—HARRY C. GOODRICH, Chicago, Ill. Application filed February 4, 1873.

Claim.—The adjustable bow-like actuating-arm, consisting of the rigid section or arm *f* and the spring-arm A to equalize the blows on the tuck-marker in all of its positions, substantially as specified.

138,637.—*Presser-Foot for Sewing-Machines.*—HARRY C. GOODRICH, Chicago, Ill. Application filed July 26, 1872.

This foot is adapted to the Wheeler & Wilson machine; is made in skeleton form, and with a narrow under surface to allow the creasing notch and edge to be brought under the presser close to the needle, and as also to allow the operator to see the line of stitching.

Claim.—As a new article of manufacture, the hollow metallic presser-foot attachment herein described, constructed substantially as and for the purpose specified.

138,638.—*Hammer for Sewing-Machines.*—HARRY C. GOODRICH and RUSSELL S. BARNUM, Chicago, Ill. Application filed February 24, 1873.

When the plates of the clamp are brought together the straight edge is pressed forward against the supporting-rod of the hemming-scroll that rests in the curved portion of the clamp. The reversed hammers are connected with and removable from the rod by means of the socket between the hammers.

Claim.—1. The clamp B, constructed as and for the purposes specified.

2. The double hemmer herein described, consisting of the two hammers *f g* and socket *h*, constructed substantially as and for the purpose specified.

138,639.—*Belt-Lacing Gage.*—HENRY GOULD, Minneapolis, Minn. Application filed February 21, 1873.

A graduated square is provided with a spring-marker capable of adjustment in a longitudinal slot for conveniently spacing the end holes for uniting machine-belts.

Claim.—The combination of a graduated and grooved square and straight-edge with a gage and marking device, all arranged substantially as described, for guiding the cutting of ends of belts and marking the location of lace-holes therein.

138,640.—*Truss.*—GEORGE W. GREGORY, Syracuse, N. Y. Application filed April 30, 1873.

A series of end and central slots is formed in the abdominal plate in order that a single pad may be fastened, with a set-screw at either end or in the middle to retain umbilical hernia. A fastening-plate carries three buckling-clamps to retain the straps at required points.

Claim.—1. A truss-plate provided with the series of central and end openings, substantially as described, to provide for the attachment of pads, as set forth.

2. The corrugated truss-plate provided with the long vertical openings at its ends for attachment of a pad or pads.

3. The combination, with the truss-plate provided with the vertical end and central slots, of the pad provided with the transverse slots and with a screw-connecting device, substantially as described.

4. A detachable truss-fastening attachment, composed of a plate or frame provided with buckle like tongues for confining the straps, and with a hook or equivalent to engage the truss-plate, substantially as described.

5. A detachable truss-fastening attachment composed of a plate or frame provided with buckle-like tongues and with a hook or equivalent to engage with the truss-plate, and with a projection at the back of the frame to bear against the other side of the truss-plate, for the purpose described.

138,641.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed January 29, 1873.

Metallic plates with projections thereon having compound metaline pressed between the said projections.

Claim.—A sheet of metal with which is incorporated metaline, substantially as and for the purposes specified.

138,642.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed February 3, 1873.

A sheet of corrugated metal, the corrugations being filled with metaline and the whole subjected to great pressure, so that the base of the corrugation folds over the metaline. It is to be cut into strips of desired size.

Claim.—A sheet of corrugated metal with which is incorporated metaline, substantially as and for the purposes specified.

138,643.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed January 29, 1872.

Metallic tubes or sheet metal bent in any desired form filled with compound metaline and subjected to severe pressure.

Claim.—A sheet of metal with which is incorporated metaline, substantially as and for the purpose specified.

138,644.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed January 29, 1873.

Perforated metallic blocks filled with compound metaline subjected to severe pressure.

Claim.—A perforated sheet of metal, with which is incorporated metaline, substantially as and for the purposes specified.

138,645.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed January 29, 1873.

Alternate layers of woven fabric (either animal or vegetable) and the compound metaline subjected to severe pressure and then cut into strips of required size.

Claim.—The composition denominated metaline, incorporated with any woven, knit, or felted fabric, of either vegetable or animal fiber, in the manner and for the purposes specified.

138,646.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed January 29, 1873.

Alternate layers of strips of wood and compound metaline subjected to severe pressure and cut in forms as desired.

Claim.—The composition denominated metaline, incorporated with sheets of wood of any kind, substantially as and for the purposes specified.

138,647.—*Egg-Beater.*—ETHAN HADLEY, Chicopee Falls, Mass. Application filed February 8, 1873.

The beaters are secured in a pinion of hard metal by a plug of soft metal having spurs on the outer surface.

Claim.—As an improvement on the Dover egg-beater, the combination of the hard-metal annular pinion D, the central soft-metal plug or core F, and the bars C, attached to the soft-metal core, constructed as shown and described.

138,648.—*Wind-Wheel.*—DANIEL HALLADAY, Batavia, Ill. Application filed December 24, 1872.

The governing mechanism of this wheel has an arrangement of the central regulating-disk, having upon its front face an annular series of slotted projections and upon its rear face a circular friction-wheel. It also consists in the arrangement of the central hub and cross-bars of the wheel-frame, of the reacting springs, and of the brake and the fast friction-wheel upon the crank-shaft.

Claim.—1. The combination, with the regulating-disk K and sails L, of the friction-wheel R and brake *u*, substantially as specified.

2. The combination, with the regulating-disk K and the eccentrically-pivoted sails L, of the radial spokes H of the wheel-frame and the reacting springs *s*, substantially as specified.

3. The combination, with the sails L, regulating-disk K, and friction-wheel R, of the crank-shaft D, friction-wheel E, and brake or brakes, substantially as specified.

4. The combination, with the regulating-disk K of a wind-wheel and the shaft D, of the friction-wheels E R, and the brake-lever *z* having an elastic arm, *y*, substantially as specified.

5. The regulating-disk K placed loosely on the wheel shaft D, provided with the slotted flange *n* in front, and the friction-disk R in rear, substantially as specified.

138,649.—*Mortising-Machine.*—EUGENE HAMMOND, Cumberland, Md. Application filed February 14, 1873.

Different-sized mortises are made in the material by adjustment of the gages.

Claim.—1. The combination, with a mortising-chisel and side-recessed post-carriage, of the gages G G or G' G', the traveling-dog H, gage I, and stop-bar J, applied as and for the purpose described.

2. The spring-pressed dog H *h* sliding in the perforated way *e'*, the gage I, and the stop-bar J, combined with the carriage of a mortising-machine, as herein shown, and for the purpose specified.

138,650.—*Fluting-Machine.*—EDGAR P. HOLLY, Lockport, N. Y. Application filed December 12, 1872.

The arms of the frame, in which the fluted rollers are mounted, hinge upon the bolt which joins them. Both arms are embraced by a movable clamp adjusted by a spring and screw. The machine is secured to a table by a screw-clamp with a pair of blocks.

Claim.—1. The combination, in a fluting-machine, of the arms A A and the bolt H forming a hinge-joint, substantially as and for the purpose herein set forth.

2. The combination of the rollers C C, the arms A A, and the movable clamp *a'* and the spring *b'*, substantially as and for the purpose hereinbefore set forth.

3. The combination of the lower arm of the frame and the clamp *a'* and the blocks *d' d'*, substantially as and for the purpose hereinbefore set forth.

138,651.—*Brick-Machine.*—HENRY HUGHES, Pekin, Ill., assignor of one-third his right to WILLIAM S. KELLOGG, same place. Application filed September 23, 1872.

A reciprocating frame having dogs or claws arranged to feed the molds automatically from two or more chambers, operated by suitable machinery.

Claim.—1. The reciprocating frame E, provided with the dogs or claws *e*, constructed and arranged to feed the molds S automatically from two or more chambers, *g*, to the receiver B, in combination with the longitudinal slots *d'* of the platform D, the whole constructed so as to operate substantially as set forth.

2. The actuating-rod F, crank G, connecting-rod H, arm I, rod K, beveled gear-wheels L M, shaft N, driving-wheel T, and beveled gear-wheels P O, all combined and arranged to operate the stirring-shaft Q and frame E, substantially as shown and set forth.

138,652.—*Steering Apparatus for Vessels.*—LYMAN HUNT, Buffalo, N. Y., assignor of one-half his right to MARCUS M. DRAKE. Application filed April 5, 1873.

Claim.—The combination, with the rudder-post, rear steering-shaft D, and hand-wheel E, of the pulleys M N, forward steering-shaft K, hand-wheel L, and chain or cable *n*, substantially as and for the purpose hereinbefore set forth.

138,653.—*Lamp.*—JOHN H. IRWIN, Philadelphia, Pa. Application filed March 17, 1873.

The ratchet bears against the central tube which rises from the bottom of the fount. The bottom plate of the Argand burner forms a drip-cup, covers the oil-fount, and is bent up at its outer edge to form the chimney-rest. The chimney covers the entire fount. A foraminous plate over the drip-cup protects the oil therein from heat.

Claim.—1. The combination, in a kerosene-lamp, of an Argand burner having its central tube extended through the bottom of the oil-pot, and a ratchet wick-raiser acting against said central tube, as and for the purpose set forth.

2. A kerosene-lamp constructed with the wick-tube permanently attached to the oil-pot, and but a single plate, B, with no unclosed perforations, interposed between the burner and the contents of the oil-pot.

3. A cylindrical or hollow wick-burner, constructed so that the central air-tube shall exert an elastic pressure against the teeth of a ratchet wick raiser, substantially as and for the purpose set forth.

4. A kerosene-burner with its bottom plate formed to constitute a drip-cup, as and for the purpose set forth.

5. In combination with a drip-cup formed by the bottom plate of the burner, a perforated peripheral rim or flange, *c*, with a seat, *a*, and series of springs *d* to clasp and hold the chimney, and so as to cause the volatile emanations from said drip-cup to pass up said chimney to be consumed.

6. A series of springs, *d*, arranged upon the wall of the oil-pot A to receive and hold the chimney, as described.

7. The cup A, plate B, and tubes C D, and the wick-raiser, constructed and arranged in the manner shown and described.

8. The cup A, plate B, tubes C D, filler E, pedestal G, and base H, all constructed and arranged as shown and described, for the purpose set forth.

9. The chimney I constructed with the expanded base, substantially as described, combined with the peripheral flange *c* of a burner whose bottom plate forms a drip-cup, substantially as and for the purpose set forth.

10. The removable perforated plate K, covering the drip-cup and filler and extending from the wick-tube to the chimney-seat, as and for the purpose set forth.

138,654.—*Lamp.*—JOHN H. IRWIN, Philadelphia, Pa. Application filed November 5, 1872.

The ascending currents of the products of combustion are prevented from entering the air-tube, and the inlets for fresh air are placed out of said currents, and none but fresh air is admitted to the tube to be heated.

Claim.—1. The combination, in a tubular lamp, of the tube E provided with the radial inlet-tubes F, substantially as set forth.

2. The combination, in a tubular lamp, of the air-tube E with closed bottom *e*, placed vertically over the flame, and provided with laterally-extended air-inlets so as to receive none but fresh air, and heat the same before it enters the burner, substantially as and for the purpose set forth.

3. The combination, in a tubular lamp, of the tube E, radial tubes F, and heating-jacket H, substantially as specified and shown.

4. The combination, in a tubular lamp, of the radial tube or tubes F, tube E, and protector G, substantially as shown and described.

138,655.—*Hoisting Apparatus.*—JOHN L. ISBELL, Naugatuck, Conn. Application filed April 16, 1873.

The bevel-gear upon the main shaft is arranged with the driving-pulley upon a sleeve which turns slightly on the shaft, so that when power is applied to raise the platform the sleeve turns slightly on the shaft, carrying with it the entire mechanism, which thereby relieves the gear from contact with the worm, and so retains it until it is desired to stop the platform, or in case of accident, when the sleeve turns in the opposite direction, and the weight is taken up by the worm and the descent of the platform prevented.

Claim.—In combination with the drum B, the two runs or chains of gearing, one of which causes the revolution of the drum to wind or raise the fall, the other the revolution of the drum in the opposite direction to lower the fall, the latter by means of a worm, L, when the device through which power is communicated in one direction is constructed to allow a slight over-motion independent of the other device for communicating power in the opposite direction, substantially as set forth.

138,656.—*Shovel-Plow.*—WELLINGTON JOHNSON and MOSES RANNEY, Northfield, Ohio. Application filed February 14, 1871.

Claim.—The shovel S, removable point P, and colter C, braces *b b*, and removable and adjustable wings W W, all constructed and arranged for operation as and for the purpose described.

138,657.—*Fluid-Meter.*—JOHN O. JOHNSON, New York, N. Y. Application filed March 20, 1873.

Within a pipe through which the water to be measured flows are arranged two auger-shaped screws, one of which is stationary while the other revolves, the revolving screw being provided with a shaft which connects with a registering mechanism inclosed in a case cast with the fluid-supply pipe.

Claim.—The case H for containing the registering mechanism and the worm-wheel of the arbor D connected with the elbow E, in combination with each other and with the movable and stationary auger-shaped screws B C, pipe A, screw G, and elbow F, all constructed and arranged as herein shown and described.

138,658.—*Machine for Making Wooden Pins.*—EDWARD C. JOHNSON, Williamsport, Pa. Application filed December 12, 1872.

The material from which the pins are to be formed is placed upon a die, and a vertically-sliding punch is driven through it by a blow from a falling weight, which strikes the upper end of the pins after they have passed through the punch, and forces their lower ends into recesses in the die, thus pointing them.

Claim.—1. The combination of the punch and recessed die, relatively arranged, as described, with the drop-weight, substantially as described.

2. In a machine of substantially the described construction, the combination of the stationary die-block having recesses, as described, the reciprocating punch, the drop-weight, and the spring for throwing the pins, substantially as described.

3. The combination of the springs E and F with the slotted pin I and its set-screw, as described.

4. The combination of the frame A, bearing-box B, shaft L, double crank H with pins A A', punch C with its connecting-rod, die D, drop-weight B, and springs E and F, all arranged and operating as described.

138,659.—*Float-Valve for Horse-Troughs, &c.*—JULIUS JOHNSON, New York, N. Y., assignor to ISAH CHASE, same place. Application filed August 17, 1872.

An elongated valve with rubber facing attached to a stem and float regulates the flow of water to a horse-trough, hydrants, &c., by the action of the float.

Claim.—The combination of the elongated cylindrical valve D, having a rubber facing, *d*, the cylinder C, the inlet B, the valve-seat E, the outlet *c*, the float I, and the connecting-stem J, when constructed and arranged in relation with each other, substantially as and for the purposes herein set forth.

138,660.—*Printing-Press.*—WILLIAM A. KELSEY, Meriden, Conn. Application filed April 3, 1873.

The vibrating platen has pivoted to it a lever carrying trunnions which bear against two inclined arms projecting from the bed. The chase is cast with a bottom for use as a composing-stick, and has ledges by which it is clamped to the bed.

Claim.—1. The herein-described press, consisting of the frame A supporting the bed C, and the platen D pivoted to the said frame below the bed, the lever G H pivoted to the said platen, and with trunnions working upon the inclined arms to give the requisite movement to the platen, substantially as set forth.

2. In a printing-press, substantially such as described, the chase I, constructed with a bottom, P, and with projections R, combined with a clamping device, S, substantially as specified, and with or without the adjusting-screw *s* through the bed.

138,661.—*Bee-Hive.*—EDWARD KRETCHMER, Coburg, Iowa. Application filed December 30, 1872.

In the center of the top is seated the axial projection of a small cylindrical vessel, close at all points except that the base of the projection is perforated that the bees may draw honey therefrom. When this perforated projection is turned upward another axial projection permits the ventilation of the hive.

Claim.—1. The parts S and *r* of the feeder and ventilator H, in combination with the roof B or its equivalent, in the manner and for the purpose set forth.

2. The ends of metal corners of glass-sided honey-boxes, made with parts *o o*, *m m*, and *p*, in the manner and for the purpose set forth.

138,662.—*Slate-Washer.*—DANIEL W. LEET and WILLIAM C. SHIELDS, Bellaire, Ohio. Application filed March 19, 1873.

The water is forced out of the receptacle into the sponge by pressing upon the elastic end of the case. The diaphragm prevents the water passing too freely into the sponge.

Claim.—1. In a slate washer or cleaner, the combination, with the cleaning-sponge thereof, of a removable cotton diaphragm, *f*, seated upon the open neck *e* of case A, and serving the several purposes herein described.

2. In a slate-washer, the combination, with the stand or case A, of the elastic end C, the removable diaphragm *f*, and the contracted seat or neck *e*, substantially as herein described.

138,663.—*Photographic Apparatus.*—WILLIAM AUGUSTUS LEGGO, Montreal, Canada. Application filed August 6, 1872.

Claim.—1. The bed *c*, with grooves *m*, boxes *n*, *o*, and *p*, screwed shafts *r* and *t*, rings or collars *s*, in combination with camera *q* and object-stand *y*, substantially as and for the purposes set forth.

2. The bed *c*, with grooves *m*, boxes *n*, *o*, and *p*, rack *u*, pinions *v* v^1 v^2, and handles W, W^1, and W^2, in combination with cam-

era *q*, and object-stand *y*, and clamps *x*, substantially as and for the purposes set forth.

3. The object-stand *y*, hinged to the box *p*, substantially as and for the purposes set forth.

138,664.—*Canal-Boat.*—WILLIAM AUGUSTUS LEGGO, Montreal, Canada. Application filed September 18, 1871.

A main canal-boat has its motor situated between flaring bows, which open into a channel the entire length of boat, and said channel is constructed to admit a supplementary boat, which also has flaring bows, so that the current of water from the motor may have an easier exit aft and the boat have less obstruction in passing through the water.

Claim.—The main vessel having the side compartments *b*, bows *b'*, deck *d*, central space *d'*, extending the entire length of the boat, and motor *e*, in combination with the supplementary vessel *f*, all constructed and arranged as described, for the purpose set forth.

138,665.—*Propulsion by Gas Explosion.*—WILLIAM A. LEGGO, Montreal, Canada. Application filed August 22, 1871.

A large tube is hinged vertically to the stern-post of a vessel and extends down into the water, having an open mouth at right angles to the length of said tube. Hydrogen-gas is admitted from gasometer into main tube and mixes with atmospheric air, which passes through a drop-valve at top. When the hydrogen predominates it is exploded by a flame from gas-jet at top, by which explosion the drop-valve closes, and the force of explosion acts against the body of water through the tube to propel the boat.

Claim.—The new and useful art of propelling vessels and driving machinery by gas explosions as a motor, with apparatus for carrying the same into effect, as follows: The novel combination and arrangement of the chamber *d*, connected with gasometer *b* by a flexible or other tube, *c*, and provided with valve g^1 and touch-hole *h* and gas-jet *i*, or their equivalents, working in combination with any vessel, *a*, substantially as and for the purpose set forth.

138,666.—*Sole-Nailing Machine.*—ABA S. LIBBY, Lawrence, Mass. Application filed April 2, 1873.

The tube through which the wire passes has a movable section, which receives vibratory motion from a lever, by which means the wire is presented to the action of the cutters, so that the point formed upon it is at or toward one side of the nail.

Claim.—1. The swing-tube *i*, in combination with the tubes *a d* and cutting mechanism, substantially as described.

2. The improved mode of presenting the wire for the action of the cutters, substantially as described.

138,667.—*Safety-Hook for Pocket-Books.*—FRANZ CARL LIKAR, Baltimore, Md. Application filed March 18, 1873.

By turning the rod the barb or hook is made to penetrate the lining of the pocket, thereby forming a safety attachment.

Claim.—The rod D having the hook G and toe F, in combination with the plate A having the slotted bridge or plate I, slots J K, and spring K', the latter holding the hook G in different positions, substantially as described.

138,668.—*Die for Forging Stay-Ends.*—PERLEY N. LOWE, Plantsville, Conn., assignor to himself and EMERY W. DOOLITTLE, same place. Application filed November 4, 1872.

Two pairs of dies, the first pair having an H-shaped recess, the space between the parallel sides being convex. The second or finishing dies have a similar recess, the intervening portion being flat, and forms each side circular in cross-section.

Claim.—The dies B D, constructed as described, for forging stay-ends for carriage iron-work.

138,669.—*Safety-Platform for Cars.*—HENRY E. MARCHAND, Pittsburg, Pa. Application filed April 3, 1873.

A hollow supplementary platform inclosing a telescopic section is hinged to the car. The telescopic section is hinged to allow of lateral movement, while the endwise movement of the same is controlled by means of a spring, which is secured between the ends of rocking levers.

Claim.—1. In a safety-platform, the rocking or oscillating lever-arms L, in combination with a fixed or hinged section, A, for the purpose of resisting the inward motion of a sliding section, and for permitting a rocking motion of the sliding section, caused by the movement of the cars, substantially as set forth.

2. The combination of a spring, K, with the levers or arms L, which are arranged within the receiver of a sliding section, for operation substantially as described, for the purpose specified.

3. A hinged or jointed door, P Q, combined with the sliding section and a fixed or hinged section, A, substantially as described, for the object specified.

4. The sliding telescopic section provided with hinged or pivoted ends for admitting of a rocking and longitudinal motion of such section within the receiver, substantially as described.

138,670.—*Seal-Lock for Boxes.*—HENRY C. MARSTON, Washington, D. C. Application filed April 18, 1873.

The cover is secured to the body of the box by means of sliding seal-plates (one or more) secured to the cover and provided with button-headed studs, which engage in slots cut in a flange attached to the box. The seal-plates are held in the locked position by means of spring-pins that engage in holes in the seal-plates, and seals are arranged to cover these holes, so that access to the spring-pins cannot be had without breaking or destroying the seals. A seal-plate is also arranged for closing the throat of boxes for receiving ballots.

Claim.—1. In combination with the cover B of the box, the sliding seal-plates c^1 c^2, (one or both,) provided with the button-headed studs *d*, engaging with the flange A' of the box, and the locking-dogs *e'*, substantially as set forth.

2. In combination with a box having a throat, C', for receiving ballots, the sliding seal-plate c^3 and locking-dog *d'*, said seal-plate having its upper end expanded and formed into a gate to close the throat C^3, substantially as described.

138,671.—*Apparatus for Cooling and Dispensing Beverages.*—JOHN MATTHEWS, New York, N. Y. Application filed April 24, 1873.

The liquid is drawn from the reservoir through a coil in an ice-chamber, and discharged into a receiving-vessel also situated in the ice-chamber, from which it is drawn as required, the pressure in the receiving-vessel being relieved as required.

Claim.—1. The combination, in the cooling-chamber, of the coil *b*, branches *c* and *l* of the draft arm of the receiving-vessel, so as to cool and dispense the beverage under reduced pressure, substantially as set forth.

2. The double-branched draft-arm with passages and valves, arranged substantially as described.

3. The combination of the ice-chamber, receiving-vessel, and draft-pipe, as and for the purpose set forth.

4. The inlet-valve, discharge-port and valve, and draft-arm, all arranged and combined substantially as set forth.

5. The gage s^2, in combination with the receiving-vessel and projecting outside of the cooling-chamber, as and for the purpose specified.

6. The receiving-vessel and draft-tube, in combination with the glass gage, as specified.

7. The receiving-vessel made wholly or in part of glass or other transparent material, in combination with a side opening or a side of transparent material in the cooling-chamber, substantially as specified.

138,672.—*Cigar-Mold.*—THOMAS D. MCGUIRE, Brooklyn, N. Y. Application filed December 24, 1872.

The chips or upper dies are formed together on one piece and strengthened by an outer back, having its grain running transversely.

Claim.—The mold having the chips C of its upper half A made of the same piece with each other and with the back *f*, substantially as and for the purpose herein specified.

138,673.—*Apparatus for Feeding and Returning Water of Condensation to Steam-Boilers.*—THOMAS E. MCNEILL, New York, N. Y. Application filed February 17, 1873.

A steam-cock in the live-steam pipe and an exhaust-cock in a branch pipe attached to said steam-pipe are connected to a cylindrical condensing-vessel. In this vessel is arranged a counterbalanced float, the lever of which is connected by another lever to the steam-cock, and as the condensed water rises and falls it operates the cocks, both being connected, one to open and the other to close. A crank connected to both cocks strikes against studs and a lip, and trips a weighted lever, which assists the opening and closing of the cocks.

Claim.—1. The combination of the steam-cock E, the exhaust-cock J, the pipes D I, in communication with the cylinder A above, the crank M, the weighted or tumbling lever K, the lever N, the lips *h*, the studs *i l k*, the crank O, the counterbalanced float B, the levers C L, the connection *f*, the cylinder A, the pipes F G, and the water-discharge pipe H, the whole being arranged for operation, substantially as specified.

2. The combination, with the water-inlet pipe G, of the pipe I, extended and constructed to discharge the exhaust steam in line, or nearly so, with the flow of water through the pipe G, the exhaust-cock J, the steam-cock E, the pipe D, the cylinder or vessel A, and the operating-float B, essentially as shown and described.

138,674.—*Sausage-Stuffer.*—FRANK MICKELS, Quincy, Ill., assignor of one-half his right to HENRY A. GEMMER, same place. Application filed March 14, 1873.

A vertical cylinder with a horizontal delivery-spout at its base. Two rods secured to the base-plate support at top a cross-head, in the center of which a screw-shaft works, carrying a platen to press down the mince-meat, being operated by a pinion and crank. When the platen is drawn to the top the cross-head is released at one side and turned off by a hinge on the other for refilling.

Claim.—The barrel B, brace H, sleeve L, wheel M, pinion P, and piston N, when arranged and operated relatively one to the other, substantially as shown and described.

138,675.—*Car-Spring.*—ALLEN MIDDLETON, Jr., Philadelphia, Pa. Application filed November 27, 1872.

The supporting-plates are connected by small spiral springs, the ends of which are screwed into the plates and surrounded by larger spiral springs, the latter kept from contact with the former by means of a raised circular projection upon the plates.

Claim.—1. A car-spring in which large spirals D are confined between plates A A, connected together by small spirals B, all combined to operate substantially as and for the purpose set forth.

2. The plate A, having the annular projections *z* threaded internally, and surrounding the small spirals and retaining the large spirals in their proper lateral position.

138,676.—*Whip-Rack.*—JOHN M. MITCHELL, Cincinnati, Ohio. Application filed April 10, 1873.

Claim.—A rack constructed of a base, A, standards B B', &c., springs C C', &c., and slots *d d'*, &c., arranged and operating substantially as and for the purpose specified.

138,677.—*Railroad-Crossing Gate.*—WILLIAM F. MORGAN, New York, N. Y. Application filed April 4, 1873.

The extensible gate is on the lazy-tongs principle, and is operated by the ordinary double-screw spindle, while the outer end is supported by the hanger traveling on an elevated way by means of friction-rollers.

Claim.—The carriage F and hanger G, in combination with the gate A and spindle C, constructed and operating substantially as and for the purpose set forth.

138,678.—*Railway-Car Brake.*—GEORGE W. MORRIS, Pittsburg, Pa. Application filed January 24, 1873.

The brake-bar is connected by rods to a socket press-piece, which embraces a central guide-rod on a cross-bar of the truck. Between the socket and rear of the guide-rod is interposed a spiral spring, which operates to release the brake-bar when the brake-lever is released.

Claim.—1. A sliding brake-bar, provided with arms and a sliding socket press-piece, in combination with a central guide-rod and a spiral releasing-spring arranged thereon, to operate as described.

2. In a car-brake release, the sliding connection of the socket-press-piece with the spring guide-rod, and having also a partial swiveling movement upon its connections, as and for the purpose described.

3. The sliding press-piece G locked upon its carrying-bar C by the grooves *e* and the stops *c*, as described.

138,679.—*Electrical Gun-Cartridge.*—THADDEUS P. MOTT and SAMUEL GARDINER, Jr., New York, N. Y., said GARDINER assignor of one-sixth his right to T. P. MOTT. Application filed April 3, 1873.

A copper pin, insulated from the cartridge-shell, passes into the cartridge, terminating near the fulminate, in order that when electricity is applied to the copper pin or wire a spark may pass through the priming to the cartridge-shell, which, being in metallic contact with the fire-arm barrel, allows the electrical discharge to pass through the person holding it to the ground.

Claim.—1. A cartridge or shell, substantially as described, adapted to be exploded by an electrical spark where a single wire is used to bring the positive current to the fulminate, the negative being obtained through the metal of the ball or other metallic surroundings of the fulminate, for the purpose set forth.

2. The combination, in a cartridge for fire-arms, of a metallic shell insulating-disk and a single "positive" wire, D, substantially as and for the purposes set forth.

138,680.—*Mortise Door-Latch.*—WALLACE T. MUNGER, New Britain, Conn., assignor to P. CORBIN and F. CORBIN, same place. Application filed April 12, 1873.

A vertically-sliding block is pivoted to the lower arm of the bent lever, and moves in a recess provided for it in the lock-case. The thumb-piece levers on either side of the door act upon this block, and, the leverage being the same, the latch is withdrawn with equal facility by pressure upon either thumb-piece.

Claim.—The slide-block *i* within the case near the opening in the bottom thereof and pivoted to the end of the lever *g h*, in combination with the latch *a*, substantially as and for the purposes set forth.

138,681.—*Cap.*—MORRIS M. MYERS, Boston, Mass. Application filed April 2, 1873.

The body is double, one-half, carrying the visor, being reversible.

Claim.—The duplex cap, capable of being reversed or of being turned wrong side out for use, formed with the reversible band *m*, reversible visor-piece *n*, and a partially-attached lining, serving as a lining to the cap when reversed, and when not reversed or when turned inside out.

138,682.—*Reservoir Cooking-Stove.*—DAVID H. NATION and EZEKIEL C. LITTLE, St. Louis, Mo. Application filed March 14, 1873.

The reservoir rests in the base-pan in the front or fire-box end of the stove. It is entirely free from contact with the stove or flues, except at its bottom. A curved damper in the front flue regulates the flow of the products of combustion. It is made in two parts, so as to be readily applied, when a new one is needed, without taking the stove apart.

Claim.—1. The arrangement of the flue E and flue-shell E', made separate and attached to the front plate of the stove, in combination with the reservoir H and exit-flue K, substantially as and for the purposes herein set forth.

2. The opening or openings in the front plate G, in combination with the damper I, flues D E, and reservoir H, for the purpose specified.

3. The direct-draft flue D in front of the fire-chamber, and formed by the flue-plate J and front plate G, in combination with the opening or openings in the front plate G, the damper I, flue E, and reservoir H, as shown and described.

138,683.—*Compound Tool.*—ELHANAN OMENSETTER and JOHN F. PARKER, Philadelphia, Pa. Application filed March 15, 1873.

Claim.—The handle A, having the gas-tube B, stop-cock C, apertures E E', and screws D D', constructed and arranged as and for the purposes set forth.

138,684.—*Manufacture of Oxide of Zinc for Pigments.*—FRANKLIN OSGOOD, New York, N. Y. Application filed April 26, 1873.

Metallic zinc in powder is mixed with coal and heated in a furnace, so that a blast of air may pass through in the same manner as in making oxide direct from the ore.

Claim.—The process herein described for manufacturing oxide of zinc from metallic zinc, the same consisting in heating the zinc mixed with coal and forcing a blast of air through or over the same, so as to form and carry off the oxide, substantially as set forth.

138,685.—*Treating Zinc Dross and Skimmings for the Manufacture of Pigments.*—FRANKLIN OSGOOD, New York, N. Y. Application filed April 26, 1873.

The ammoniacal skimmings are ground and sifted so as to separate the metal from the zinc and other salts, then roasted, and afterward converted into zinc-white or zinc-lead in the usual way.

Claim.—1. The process herein described for purifying galvanizing dross or skimmings, consisting in grinding or crushing, sifting, and roasting, substantially as set forth.

2. The process of producing oxide of zinc or other pigment from dross by roasting, mixing with coal, and subjecting to heat with a blast of air, substantially as set forth.

138,686.—*Ice-Pitcher.*—EDMUND A. PARKER, West Meriden, Conn. Application filed April 16, 1873.

The shell of the pitcher is made in two parts, so that the larger base of the lining will go into a shell with a smaller top. The parts are held by screws.

Claim.—In that class of pitchers in which the lining is of an increasing diameter toward the bottom, dividing the shell at a point below the top, where the internal diameter of the shell is slightly larger than the largest diameter of the lining, and providing one part with a bead at the joint, and attaching the handle and spout to the upper portion, so that by means of the said handle and spout the two parts are secured together, substantially as set forth.

138,687.—*Self-Waiting Table.*—WILLIAM W. PATTERSON, Crawford Springs, Va. Application filed February 21, 1873.

The central revolving top and the outer stationary top are both bisected and hinged. The legs are attached to the stationary top by hooks, and the legs are connected together by cross-pieces having bed-joint hooks.

Claim.—The combination of the bisected and hinged top D, and bisected and hinged revolving top D^1, detachable legs A, and cross-pieces B and C, connected to the legs by the bed-joint hooks *a*, substantially as and for the purposes set forth.

138,688.—*Plastic Compound for Furnace-Lining, Retorts, &c.*—SAMUEL J. PAYNE, Charlton, England. Application filed April 9, 1873.

The calamine applied to the surface of molded articles fuses upon them when they are burned, and produces a tough surface.

Claim.—1. A plastic composition consisting of siliceous and aluminous materials combined with calamine, in or about the proportions above set forth.

2. The application of calamine to the external surfaces of molded articles composed of a plastic compound of siliceous and aluminous materials, in the manner and for the purpose above set forth.

138,689.—*Printing-Press.*—FREDERICK C. PENFIELD, West Meriden, Conn. Application filed April 3, 1873.

The swinging platen is forced into contact with the fixed bed by a lever, carrying at its short end a friction-roller, bearing against a cam-faced rib.

Claim.—The herein-described printing-press, consisting of the frame A A supporting the bed B, and the lever L, and the swinging platen C, the said lever constructed and arranged so as to impart the requisite movement to the said platen, substantially as set forth.

138,690.—*Piston-Packing.*—CHARLES E. PERKINS, Malone, N. Y. Application filed September 24, 1872.

There are two sets of double rings divided by a metallic steam-tight diaphragm. Apertures being made in each end of the piston, steam is admitted through said apertures when the piston is traveling in the direction front or back, respectively, and thus the packing-rings are expanded to fit the bore of the cylinder.

Claim.—1. The double ring D, constructed, as described, of an inner ring, *a*, and an outer ring, *b*, connected together by studs *d d*, and cut apart at *e*, with a partition, *f*, on each side of said cut, substantially as and for the purposes herein set forth.

2. The combination of the head B with holes *i i*, spider C, the double rings D D, partition-ring E, and cover or follower G with holes *i i*, all constructed, arranged, and fastened together, substantially in the manner and for the purposes herein set forth.

138,691.—*Work-Holder.*—RUSSELL W. PERKINS, West Meriden, assignor to himself and JAMES H. HOLMES, Wallingford, Conn. Application filed February 6, 1873.

The base of the work-holder has a groove on its under side adapted to receive and slide upon a plate secured to the table.

Claim.—A work-holder, the base of which is constructed with a groove or slot, combined with a correspondingly-shaped block to be attached to the table, so that by means of the said block the holder may be secured to or removed from the table without removing the block from the table, substantially as set forth.

138,692.—*Bath-Tub for Bird-Cages.*—GEORGE T. PETERS and GEORGE E. PETERS, Jersey City, N. J. Application filed March 6, 1873.

The tub is covered by a shield of vitreous material, except one end, which is left open for the entrance of the bird. The water is kept clean, and young birds are prevented from falling into the water.

Claim.—The shield or dome B, with rounded end, sides, and top, made of a single piece of material, and with open front, as shown, and fitted upon the bath-tub A, substantially as and for the purpose described.

138,693.—*Wagon-Seat.*—JOHN W. PLATTENBURG, Tiffin, Ohio, assignor to himself and J. G. ARMSTRONG, same place. Application filed September 10, 1872.

The outer ends of the compensating-springs are secured to the bearing-block, the inner ends having a limited lengthwise movement.

Claim.—The combination of the seat A with downward-projecting ears *b b* and friction-rollers *d d*, springs B B, blocks C C, bars *a a*, and the sliding metal straps D D moving over the rollers *d d*, and having hooked ends, all substantially as set forth.

138,694.—*Steam-Boiler Furnace.*—ALONZO C. RAND, Aurora, Ill. Application filed March 5, 1873.

A steam-boiler furnace having within it a steam-generating chamber, and connecting with the outer chamber by means of circulating-pipes at the top, sides, and water-legs, said inner cham-

ber having within it the fire-place, and open at the bottom, the products of combustion passing down and around between the inner chamber and the inside walls of the outer chamber, and supplied with air and steam from the top by means of an injector-head to promote combustion.

Claim.—The combination, with a boiler-furnace, of the interior double-walled magazine B, connected, by pipes *b b*, with the steam and water spaces of the boiler, and the injector C, supplying steam and air to the interior of the magazine, all substantially as and for the purposes herein set forth.

138,695.—*Steam-Pump.*—GEORGE J. ROBERTS, Dayton, Ohio. Application filed February 5, 1873.

A cut-off valve is arranged in a hollow piston-valve and operated by a valve-stem passing through the main stem and an eccentric on an arm of the main crank-shaft, and reciprocating in a slotted head or guide. The pump-cylinder has a relief port or groove in it, near each end of the cylinder, and somewhat greater than the length of the piston, for permitting a portion of the water at its front to escape into the space at its rear and relieve the pressure.

Claim.—1. In a steam-engine provided with a piston-valve which is positively driven by steam-pressure, the combination of said valve with the driving-shaft and suitable mechanism in such a manner as to cause the motion of the former to assist the main crank over its dead-centers, substantially as specified.

2. In combination with the hollow piston-valve Q, provided with an interior valve-seat and with the ports T and U, the slide-valve N, constructed to operate substantially as and for the purpose shown.

3. The hollow and solid valve-stems P and *w*, respectively, when arranged as shown and combined with suitable valves and mechanism to reciprocate the same, substantially as and for the purpose set forth.

4. The main valve O, constructed as shown, and provided with the inlet-port *o*, main ports *l l* and *m'*, and the supplemental ports T T and U, when said ports are arranged substantially as and for the purpose described.

5. In combination with the valves O and V and with their rods P and *w*, respectively, the shaft H provided with the crank A', the slotted head R, the box S, the strap W, and the eccentric X, substantially as and for the purpose specified.

6. In a pump-cylinder, a relief port or groove, *b*, placed near each end, and operating in connection with the plunger E', substantially as and for the purpose shown.

138,696.—*Coffin-Handle.*—HERVEY ROGERS, Jr., West Meriden, Conn., assignor to C. ROGERS & BROTHER, same place. Application filed April 3, 1873.

The thin metallic tube forming the handle is enlarged at the point where the lever-socket is to rest. This is done to prevent the injury to the ornamentation as the lever-socket is slid along. The socket, of course, by this arrangement, can be made larger than all parts of the tube except that which is enlarged.

Claim.—In a casket-handle formed from a bar extending through levers, the said bar, when enlarged at the point where the levers are to be attached, substantially as and for the purpose specified.

138,697.—*Water-Meter.*—ALBION M. ROUSE, St. Louis, Mo., assignor of one-half his right to PETER E. BLAND, same place. Application filed December 11, 1872.

In the water-way is inserted a case which has a spring-valve that opens more or less, according to the water-flow, the valve being inclined so as to deflect the current to the periphery of the chamber containing the bucket-wheel. A small passage between the valve and its seat allows the water which may leak from the hydrant to pass to the chamber and be registered. The register-gear case is attached to a disk that fits, with a water-tight joint, the end of the bucket-wheel case, and is secured by a coupling-nut, so that the register-case may be adjusted to any position irrespective of the position of the bucket-wheel.

Claim.—1. The case E, for insertion in the feed-pipe of a rotary meter, and provided with a spring-valve, F G, substantially as set forth.

2. In combination with the case E, the valve F, when the same is provided with an orifice, *c*, substantially as and for the purpose set forth.

3. The wheel B having a reduced waist, B', devoid of buckets, in combination with the valve F, as and for the purpose set forth.

4. The register M', secured to the case A by means of the disk O and nut P, to allow the adjustment of the register on the case A, substantially as set forth.

138,698.—*Railway-Rail Chair.*—WILLIAM A. ROWLAND, Waverly, N. Y. Application filed April 12, 1873.

The chair is so formed as to be capable of being placed in position from the outside without removing the rail, the hooked and curved bolt being afterward inserted and confined by a nut for holding the inner flange of the rail.

Claim.—The combination, with the curved bolt D, of the chair C provided with a curved bearing to fit the bolt and to give a downward draw to the ends of the same, substantially as specified.

138,699.—*Whiffletree Snap-Hook.*—CYRUS W. SALADEE, Pittsburg, Pa. Application filed April 29, 1873.

A chamber is provided in the whiffletree-ferrule for the spring, which operates the snap-hook.

Claim.—The independent spring O, with or without the friction-plate C, secured to operate within the chamber or recess B of the ferrule or socket F, in combination with the snap-hook A, substantially as and for the purpose set forth.

138,700.—*Faucet.*—EDWARD SCRANNAGE, Jr., Melrose, Mass., assignor to SCRANNAGE, D'ESTE & CO. Application filed February 17, 1873.

Packing is wrapped on the spindle and held in place between a shoulder there and a sleeve forced down upon it by a screw, the whole sliding in the cap C.

Claim.—The spindle *b* with its shoulder *c*, packing *d*, and removable sleeve or tube *e*, in combination with the cap C, operating substantially in the manner and for the purpose set forth.

138,701.—*Coupling for Whiffletrees.*—WILLIAM C. SHIPHERD, Cleveland, Ohio, assignor of three-fourths his right to S. S. COE, JOHN J. SHIPHERD, and JAMES R. SHIPHERD, same place. Application filed January 31, 1873.

A recessed plate, having two flanged disks on the opposite sides of it, is attached to the whiffletree.

Claim.—1. In a whiffletree-coupling, the recessed plate C and disks I O, combined substantially as described, for the purpose specified.

2. In a whiffletree-coupling, the disk I provided with studs R, as and for the purpose set forth.

3. The combination, with the disks I O, of the fastening-bolt T and nuts W X, as and for the purpose set forth.

4. The combination of the recessed plate C, disks I O, and packing P Q, as and for the purpose set forth.

138,702.—*Thill-Coupling.*—WILLIAM C. SHIPHERD and EDWARD P. CURTISS, Cleveland, Ohio, assignors of three-fifths their right to S. S. COE, JOHN J. SHIPHERD, and JAMES R. SHIPHERD, same place. Application filed January 28, 1873.

The thill is secured to the squared ends of conical bearing-bolts.

Claim.—The hollow angular tenons G G, formed with the conical bearing-bolts D D and angular eyes S S, in combination with the thill-iron E, the adjusting and retaining bolt H, and the shackle A having the conical recessed jaws C C, and the interposed packing, substantially as herein shown and described, for the purpose specified.

138,703.—*Planing-Machine.*—ALBERT H. SHIPMAN, Albany, N. Y. Application filed March 17, 1873.

Lumber is taken out of "wind" in its seasoned shape to prevent the warping which results from dressing the surface to a gage under pressure rollers or bars.

Claim.—1. The combination of the beds B B', throat *a*, cutter D, and follower C, for operating in connection with the feed-rollers F, for the purpose of taking the wind out of lumber, substantially as described.

2. In combination with the levers I I and pendent loops *o o*, the screw-rod *q* and clamping-collar *i*, arranged and operating as herein specified.

3. In combination with the bed B and feed-rollers F F, the follower C, working in guide-grooves in the bed B for guiding the back end of the board true with the front end, as herein described.

4. In a planing-machine, the method of feeding the lumber to the cutters and feed-rollers in a continuous length by means of the dogs L L, provided with spurs *y y*, which engage the ends of the pieces, as and for the purpose specified.

138,704.—*Stair-Rod.*—ELDRIDGE J. SMITH, Washington, D. C. Application filed January 7, 1873.

The ordinary wooden stair-rod is held in place by metallic caps or end pieces of peculiar construction, one end projecting outwardly, a screw-hole at or near the middle, and the other end formed with a curved projection, adapted to rest on and secure the rod in position. The rod is prevented from slipping by a shoulder on the outer edge of the cap, which bears against the beveled end of the rod. When the rod is to be detached the screw is loosened, and a slight difference in configuration of the end piece adapts the device for use either on the angle or upon the riser of the stair.

Claim.—In combination with the rod A, the plates B B, provided with the cap and shoulder C and curved projection D, and secured by the screw E or its equivalent, substantially as and for the purpose hereinbefore set forth.

138,705.—*Centrifugal Machine.*—JOHN SPARROW, Portland, Me. Application filed March 19, 1873.

The sirup thrown from the basket runs down the inclines, escaping by the pipes at the bottom of the inclines. The pipes are movable, and may be turned simultaneously to direct the different grades of sirups into separate tanks. Steam is admitted to the chambers beneath the inclines to facilitate the flow of the sirup.

Claim.—1. The base of a centrifugal sugar-machine constructed with an annular chamber having one or more inclined planes, as aforesaid, and having also heating-spaces beneath said planes, substantially as and for the purpose described.

2. The combination of the base C, adjustable pipes I, connecting-bar K, and lever L, substantially as and for the purpose specified.

138,706.—*Trace-Detacher.*—WILLIAM H. STIMELY, Buchanan, assignor of one-half his right to WILLIAM H. DOYLE, Pittsburg, Pa. Application filed March 18, 1873.

The trace is inserted between the faces of a bifurcated rod, and, by means of a spiral spring, the rod is held in place on the end of the whiffletree. The rods being forced apart by means of a lever, which is inserted between their inner ends, the traces are detached from the whiffletree.

Claim.—1. The combination of the whiffletree A, sliding rods F, slotted heads H, slotted elbows M, spear-head L, lever K, cord N, springs G, and friction-rollers I, substantially as and for the purpose specified.

2. The combination of the holdback-plate O, holdback P, tongues Q, spring S, and thill C, substantially as and for the purpose specified.

138,707.—*Traction-Wheel.*—HENRY T. SMITH, Peoria, Kans. Application filed May 2, 1873.

An elliptical traction-wheel is encircled by three independent endless traction-belts, the outer one forming the endless track, which affords a large traction-surface.

Claim.—1. The combination, in an elliptical traction-wheel, of a traveling sectional supporting-track, C, connected by knuckle joints, for the rollers B, with a bracing-frame of links, G, forming a part of said sectional support C, and traveling with the same to render rigid and straight the supporting-sections C for the rollers B, essentially as described.

2. In an elliptical traction-wheel, adapted to be supported by a single axle-tree, the traveling bracing-frame of links G, having a capacity to lengthen and shorten to conform to the flat and rounded sides of the elliptical wheel, essentially as described.

3. In a single elliptical traction-wheel, adapted to be supported by a single axle-tree in a fixed hub, A, and having both sectional and roller-traveling supporting-tracks C B, the combination therewith of an encircling traveling-track, D, arranged and operating jointly with the elliptical wheel, essentially as described.

4. In an elliptical traction-wheel, having an outer traveling-track, D, the slits or bed-sections thereof interlocked with the sectional traveling-supports C, to be independent thereof, and to be free to rise and fall vertically to conform to the ground, substantially as described.

138,708.—*Button-Fastening.*—EDWARD J. F. STOLTE, Washington, D. C. Application filed March 19, 1873.

A metallic disk has a perforation at its center, through which the eye of a button is passed, and loops or guides are struck up from its under side to receive a notched bolt or bar which slides through the shank. The bolt is secured by the notches and also by a spring formed by a U-shaped slot in the disk.

Claim.—1. The fastening device constructed substantially as herein described, consisting of a plate, A, and pin B, arranged to be secured in position by one longitudinal movement, and not to be withdrawn without two partial rotary movements, in connection with a longitudinal movement, substantially as specified.

2. The combination and arrangement of the plate A, having two or more loops, *c d e*, and one or more spring-loops, *g*, and slotted pin B, all arranged and operating substantially as herein set forth.

138,709.—*Coupling-Joint for Reapers.*—GEORGE W. SYLVESTER, Plainview, Minn. Application filed October 26, 1872.

A joint made of two parts, connected by screw, and having a rubber bearing fitting in grooves.

Claim.—The reaper-joint herein described, consisting of the adjustable internally-grooved eyes B B', rubber packing D arranged within the grooves *c*, and the adjusting-screws C, the several parts being constructed as shown and specified.

138,710.—*Construction of Buildings.*—JOSEPH TALL, Southwark, England. Application filed June 4, 1872.

Adjustable and extensible panel-frames for laying up walls of concrete, cement, &c., without skilled labor. The panels are adjusted by means of the screw-bolts *e*, nuts e^2, and tubes e^1 for thick or thin walls, and they can also be varied in length by adding or removing sections e^1. Holes for the reception of the joists are formed in the walls by means of sand-cores, which are removed after the walls have hardened.

Claim.—1. The molds for forming walls of concrete, composed of frames consisting of panels connected at their ends to wrought-iron pieces which may be used to form the corner or angle of a wall or building, in combination with the screw-bolts *e*, the nuts e^2, and tubes e^1, substantially as and for the purposes herein set forth.

2. The adjustable panels, in combination with the metal rods *i*, provided with holes i^1 arranged to receive cross-pins *j*, and constructed and arranged to admit of additional or short lengths of panel when necessary, substantially as and for the purpose set forth.

3. The iron boxes *m*, when used in combination with sand, dust, or other friable substance, capable of removal with facility from the wall, for the purpose of leaving recesses to receive the ends of the flooring-joists, substantially as described.

138,711.—*Breech-Loading Fire-Arm.*—JAMES PATTON TAYLOR, Elizabethton, Tenn. Application filed October 29, 1872.

Claim.—1. The combination of a laterally-swinging breech-block, F, and an axial breech-bolt or plug, H, sliding within the breech-block to close the breech-cavity *f* and to furnish the rear abutment for the charge, substantially as herein shown and described.

2. The swiveled face-plate I containing the hammer-aperture *k*, in combination with the breech-block F and breech-bolt H and a firing-pin, J, arranged within the same, communicating the rotary motion of the breech-bolt to the face-plate and thereby shifting the hammer-aperture, so as to prevent accidental firing before the bolt is locked.

3. The cartridge-extractor G, furnished with the retracting-spring *u* and spring-latch *b*, in combination with the breech-block F and breech-bolt H constructed with the tripping-incline 7 and lugs *n*, respectively, substantially as herein specified, said extractor being withdrawn by the breech-bolt and returned to its seat automatically.

138,712.—*Manufacture of Soap.*—RICHARD P. THOMAS, San Francisco, Cal. Application filed October 31, 1872.

The fats, oils, and resin are melted by steam heat, the caustic lyes thoroughly mixed, the mass allowed to rest until saponification takes place.

Claim.—Saponifying vegetable and animal fats, in combination with resins, by fermentation or chemical agitation, in an open vessel, with salty caustic alkalies of high strength, substantially as set forth and described.

138,713.—*Machine for Rubbing and Rolling Seams of Boots.*—ALBERT THOMPSON, Boston, Mass. Application filed JUNE 5, 1873.

To the end of the reciprocating rod is attached a double head adapted for either rolling or rubbing action, with mechanism for reversing the same while the machine is in motion.

Claim.—1. The improved rubbing-down machine for seams of boots and shoes, consisting of the reciprocating rod A with the slot *g*, the lever E, the gearing *f'* and *f''*, the sleeve D, the operating ends *b* and *c*, the treadles J and K with their several connecting-rods, and the stretcher or form I, in combination, substantially as above described.

2. The reciprocating rod A with the slot *g* passing through the sleeve D, with the pin A, the double head B, the lever E, and the gearing *f'* and *f''* in combination, in the manner and for the purpose substantially as above described.

3. The stretcher operating as a holding device for rubbing or rolling down the seams of boots and shoes, in combination with the double head B adapted for either rubbing or rolling, and actuated by a reciprocating rod.

4. The reciprocating rod A, passing through the sleeve M eccentrically, so as to be revolved with it by means of suitable gearing, and the lever E, substantially as above described.

138,714.—*Musical Blackboard.*—JAMES M. THOMSON and JAMES CORDLEY, Adrian, Mich. Application filed November 25, 1870.

The blackboard is provided with music staves and notes, which latter, being in fact keys connected with properly-tuned reeds, are, when pressed, accompanied by the appropriate and corresponding sound, the hollow supports conveying air to or from a bellows in the pedestal, in which the whole packs away.

Claim.—1. A musical blackboard provided on its face with keys arranged upon a staff or staves, to represent musical notes, and connected with valves to control corresponding musical reeds or their equivalent, the whole supported by one or more hollow standards constituting wind-trunks, upon a pedestal containing the bellows by which air is supplied or exhausted to sound the reeds, all substantially as described, for the purposes set forth.

2. The additional sounding-board T, throat M, valves E E', and reeds L, all arranged substantially as and for the purposes set forth.

3. The musical blackboard A A' hinged or jointed together, as at U U', in combination with the detachable hollow standards C C, and the pedestal B, adapted to contain the board A A', when folded substantially as described.

138,715.—*Gas-Machine.*—HOWARD TILDEN, Philadelphia, Pa. Application filed April 17, 1873.

The carbureting-chamber is made separate from the hydrogen-gas-generating chamber for greater convenience in operating each.

Claim.—1. The combination of the cylinder 1, bell 2, basin 6, pipe 8, hydrocarbon-compartment 9, standard 19, and drip-cup 14, as described and illustrated.

2. The construction and arrangement of cylinder 1, bell 2, basin 6, pipe, 8, hydrocarbon-compartment 9, standard 19, drip-cup 14, as and to operate as set forth and described.

3. The Sisal hemp in the lower part of the hydrocarbon-compartment 9, in combination with the charcoal in the upper part above the screen 10, separating the charcoal from the Sisal hemp, as described and set forth.

138,716.—*Leg for Folding Lounges.*—JONATHAN F. TOWEY, Medford, Mass., assignor to himself and Julian D'Este, same place. Application filed April 7, 1873.

A double plate or hollow socket receives the slotted end of the leg on its central pivot; the leg has also a pin projecting from its face that engages with notches on the socket. The screw-openings in the outer plate of the hollow socket are made large enough to permit the screw-heads to pass through and rest in the openings of the inner plate.

Claim.—1. The hollow socket B provided with one or more notches, *g*, in combination with the leg A pivoted thereto, and provided with a slot, *d*, and a pin or projection, *h*, operating substantially as described.

2. The hollow socket B, constructed with openings *f* in its outer plate 6 to allow of the passage of the heads of the fastening-screws *e*, substantially as and for the purpose set forth.

138,717.—*Car-Axle Box.*—JOHANN ERNST UHL, Renovo, Pa. Application filed September 28, 1872.

The cover is held securely by a spring, one end of which is held in a recess in the forward part of the cover, the other end bearing upward against an angular surface upon the hinge. A projecting ridge upon the cover or a set-screw gives the requisite tension to the spring. A pad is attached to the inner side of the cover by suitable cement. A dust-guard, composed of a double metallic ring, held in place by springs and divided packing-rings placed over the same, excludes the dust from the rear end of the box.

Claim.—1. The external spring D applied to the center of the cover C, and projecting within a recess, 6, in the hinge-lug 1, and pressing upward against a suitable bearing-surface on the same, so as to hold the cover against all parts of its seat, substantially as described.

2. The combination, with the box B and cover C, of the spring D and angular bearing-surface 8 9, arranged as herein described, so that the said spring will hold the cover against all parts of its seat when closed, and support it when open.

3. The fulcrum enlargement 10 on the end of the spring D, and the flaring fulcrum-socket 5 with groove 11, for securing the spring by its own resiliency, as herein set forth.

4. The adjusting or set screw 12, employed in connection with the spring D and cover C, in the manner and for the purpose specified.

5. The combination of the cover C, pad 13, and an intervening body of cement, 14, applied in manner substantially as herein described, in order to adapt the pad accurately to the cover-seat, as explained.

6. The locking-clips 16, in combination with the open hinge-lugs 17 of the cover C, and the hinge-plate 7 attached to the box, for the purpose specified.

7. The supplemental cover-frame I, constructed with the recessed hinge-lug 1 and seat 2, for application to old boxes, in combination with a gasket, 21, and the cover C and its spring D, as herein set forth.

8. The locking strips or clips 22, in combination with the supplemental cover-frame I and its attaching-bolts 23, for the purpose stated.

9. The dust-guard, composed of the metallic ring E and packing F, supported by springs G H, substantially as herein described, for the purpose set forth.

10. The dust-guard-supporting ring E, composed of two interlocking parts, *a b*, constructed substantially as herein set forth, in combination with the divided packing F 28, for the purpose specified.

138,718.—*Table.*—JERVIS H. WATTLES, Battle Creek, Mich. Application filed April 12, 1873.

The legs are made detachable, and are provided with beveled shoulders, which engage with the beveled shoulders of the end and side rails; and the outside clamp is connected to said leg and rails by a bolt passing through the clamp and leg.

Claim.—1. The removable leg C, provided with the beveled shoulders *c e*, in combination with the beveled ends or corners of the end and side rails, substantially as described.

2. The combination of the corner-clamp E, through bolt D and nut, with the removable leg C, for clamping said leg to the rails, substantially as described.

138,719.—*Fly-Switch.*—LYMAN S. WELCH, Canaan, N. H. Application filed October 15, 1872.

Claim.—The combination of the wires B B' and C, linked and adjusted together, as shown, with the handle A and rests *d'*, substantially as and for the purposes set forth.

138,720.—*Automatic Fan.*—THOMAS WELCH, Philadelphia, Pa. Application filed March 21, 1873.

A horizontal shaft, provided with friction-wheels at both ends, hangs in bearings clamped to a sewing-machine table, and communicates motion from the fly-wheel to an upright fan-shaft. The fan-shaft has at its lower end a disk which rests upon the outer friction-wheel of the horizontal shaft, and carries a peculiar double-armed socket at its tip.

Claim.—1. The fan-shaft H with disk L resting on the friction-wheel G', substantially as and for the purpose set forth.

2. The shaft F having an axial movement and carrying the friction-wheels G G', operating in combination with the fan-shaft H, substantially as and for the purpose set forth.

3. The shaft H carrying the fan and disk L, in combination with the shaft F carrying the friction-wheels G G' and mounted on the pivoted arm D, substantially as and for the purpose described.

4. The fan, constructed of the blades N N and cross-arms M, substantially as and for the purpose set forth.

5. The holder P, consisting of the diagonally-arranged sockets P', for the crossed arms of the fan, substantially as and for the purpose set forth.

138,721.—*Die for Cutting and Cupping Sheet Metal.*—CHARLES F. WILSON, Northbridge, Mass., and SAM. H. MILLER, Brooklyn, N. Y., assignors to themselves and JESSE E. FOLK, Brooklyn, N. Y. Application filed December 24, 1872.

The margin of the disk, cut by the joint action of an external annular cutter and an internal annular cutter, is clamped between the latter cutter and a ring supported by a spring, and which, while yielding to the descent of the internal cutter and to the gradual withdrawal of the plate, prevents buckling of said plate.

Claim.—1. The combination, substantially as herein shown and described, with the female cutting-die B, male cupping-die *d*, and the female cupping-die A, constructed to also form a male cutter, of the spring-borne clamping-ring or follower C, wholly within the space separating the dies B and *d*, for operation together, as specified.

2. The arrangement of spring *k* externally to the dies, and the device supported by said spring, and which supports the follower C within the die, substantially as described and shown, whether said device be posts or any equivalent thereof.

138,722.—*Steam-Radiator.*—JAMES P. WILSON, Yonkers, N. Y., assignor to ADAM CARR, Paterson, N. J. Application filed February 14, 1873.

In the bottom plate, beneath the transverse division-plate in the base, are depressions to hold the water of condensation and form a water-seal between the inlet and outlet pipes.

Claim.—An opening between the inlet and outlet steam-spaces located below the level of the water of condensation to form a water-seal for insuring the circulation of steam in a radiator, substantially as set forth.

138,723.—*Superheater for Steam-Boilers.*—JOHN WOLFORD and ROBERT CONNER, Knightsville, Ind. Application filed January 9, 1873.

Steam is superheated after passing from pipe E through the compartment D in chamber B, thence into the outer pipes F, from these two outer pipes the steam works through the compartment *d* and intermediate pipes F to the central chamber D', whence it is discharged through the pipe G for use.

Claim.—1. The semi-annular chamber B having the longitudinal compartments D D' and the transverse compartments *d*, in combination with the serpentine pipes F, inlet-pipe E, discharge-pipe G, and boiler A, all arranged as described.

2. The semi-annular chamber B, in combination with the boiler A, drip-pipes H, and ball-valves *h*, as specified.

3. A boiler for superheating steam having an arched series of serpentine pipes, F, in combination with a series of cells or compartments, *d*, and chamber B, all as specified.

138,724.—*Vault-Light.*—JOHN WOOD, New York, N. Y. Application filed November 26, 1872.

Claim.—The bulb A formed with the packing-supporting flange, as shown, and with external screw-threads for operation in connection with the plate A, as and for the purpose specified.

138,725.—*Sounding-Board Bridge for Musical Instruments.*—GEORGE WOODS, Cambridgeport, Mass. Application filed March 27, 1873.

The metallic plate or bridge to which the sounding-forks are attached is connected to the sounding-board by a curved shank at one end; the other end remains free to vibrate, but is secured from displacement during transportation by a rubber-lined ear.

Claim.—A metal bridge for musical instruments, attached by one end only to the sounding-board, or its equivalent, and allowed to vibrate freely at its other end, for the purpose and in the manner herein shown and described.

138,726.—*Walking-Cane Umbrella.*—EDMUND WRIGHT, Philadelphia, Pa. Application filed September 25, 1872.

Claim.—1. A walking-stick parasol, the handle or stick of which is in sections capable of being connected to or detached from each other, for the purpose set forth.

2. The combination, with the sections of a parasol or umbrella stick, of a coupling, consisting of two metal blocks, A A', each having a socket to receive the end of one of the sections, and one having a threaded projection adapted to a recess in the other, and a chain secured to a ring or rings, and permanently connecting the sections without preventing them from turning independently, as specified.

138,727.—*Unloading Coal-Barges.*—WILLIAM A. WRIGHT, East Haven, assignor to AMERICAN COAL-BARGE COMPANY, Bristol, Conn. Application filed January 3, 1873.

A coal-barge and elevator, the former provided with wells and pockets or receptacles, the latter moving on tracks, so that it may be secured over any of the wells, which are walled openings extending below the pockets such a distance that when buckets rest on the bottom of the wells the material in the pockets will of itself flow out through gates and fill the buckets, which are elevated in frames, moving between ways or guides, and emptied into dump-chute attached to tower of elevator.

Claim.—1. The combination of the pockets C, well B, tower D, dump-chute F, and tub *b*, all operating in connection with each other, substantially as described, and for the purpose set forth.

2. The arrangement herein described for suspending the dump-chute, whereby it is made yielding when forced upward by the buckets, substantially as described, and for the purpose set forth.

3. The combination of the body or hull of the barge-tower or elevator-frame with the dump-chute and vertically-adjusting mechanism, substantially as and for the purpose described.

4. The combination of the dump-chute, changeable apron *u*, and buckets *b b*, operating alternately, all substantially as described, and for the purpose set forth.

5. The gate *c*, hinged at the bottom of the opening *v*, in combination with the bucket *b*, substantially as and for the purpose described.

138,728.—*Book-Rest for Desks.*—LIDA A. TARRING, Washington, D. C. Application filed April 26, 1873.

A board and cleat at the lower edge are secured to the sides of an ordinary desk by two slotted arcs fastened with thumb-screws and an arm moving in staples.

Claim.—The rest B, combined with the slotted arc C provided with the arm *e*, and secured to an ordinary desk by set-screws, as and for the purpose set forth.

REISSUE PATENTS.

5,391.—*Seam for Boots and Shoes.*—SAMUEL A. BRACKETT and WILLIAM W. WHITCOMB, Boston, Mass.—Patent No. 133,826, dated December 10, 1872. Application filed February 26, 1873.

Claim.—In a boot or shoe, the seam formed by stitching the two parts to be joined to each other, with their surfaces placed together, as described, and then turning the edge of the one part over and stitching it down beyond the edge and to the main body of the other part, substantially as and for the purposes hereinbefore set forth.

5,392.—*Egg-Carrier.*—ABNER H. BRYANT, Chicago, Ill.—Patent No. 104,261, dated June 14, 1870. Application filed April 5, 1873.

Strips having inclined slits in their upper edges are interwoven with strips having inclined slits in their under edges, portions of the strips of pasteboard being left in each series for the purpose of holding the walls of the adjacent pockets apart and to prevent breakage.

Claim.—1. The combination, with the strips A having sloping or inclined notches in the lower edges, of the strips B having the sloping or inclined notches in their upper edges, substantially as specified.

2. Strips of pasteboard or other flexible material provided with inclined or sloping notches or slits in their upper or under edges, substantially as specified.

3. The strip A having inclined or sloping notches in its lower edge and separating-tongues, substantially as specified.

4. The strip B having inclined or sloping notches in its upper edge and separating-tongues, substantially as specified.

5,393.—*Hollow Auger.*—WILLIAM A. CLARK, New Haven, Conn. Patent No. 121,707, dated December 12, 1871. Application filed April 17, 1873.

The depth of tenon is regulated by the flanged disk secured by the set-screw, and the diameter of it by the wedges and screws.

Claim.—1. The stop A having the beveled slotted shank *c*, constructed and arranged to operate in connection with a hollow auger, as herein set forth.

2. The combination of the wedges *e* and screws *h* with the slotted head or tube C of a hollow auger, substantially as and for the purpose herein set forth.

5,394.—*Condenser and Feed-Water Heater for Steam-Engines.*—JOSEPH DILWORTH, Muskoka District, and JOHN C. HODGINS, Toronto, Canada; said DILWORTH assignor to THOMAS K. MORGAN and HORACE THORN, Toronto, Canada.—Patent No. 111,916, dated February 21, 1871. Application filed March 28, 1873.

The exhaust steam enters at the upper side of a vertical-tube condenser, and the condensing water at the lower end of the tubes. A perforated cap is arranged over the top of the tubes. Below the tubes is a chamber for receiving the condensed water, and a spray-pipe is arranged in this chamber for condensing any steam not already condensed. An overflow-pipe is arranged at the upper end, under the tube-sheet. The feed-water is heated at the same time that the steam is condensed.

Claim.—1. In a feed-water heater, the combination of water-cylinder *a*, steam-pipes *b* passing through the heads of said cylinder, steam-chamber *f* above said steam pipes, into which chamber the exhaust steam enters, condensing and vacuum chamber below, but connecting with said pipes, for superinducing the downward passage of the steam through said pipes, and preventing back pressure, water-inlet *l* at the lower and water-exit *n* at the upper end of said cylinder, all arranged as and for the purpose described and represented.

2. The perforated plate *h* in the chamber *f* above the vertical ends of the vertical tubes *b* of the feed-water heating apparatus, for the purposes set forth.

3. The blow cocks or valves applied to and combined with the chamber *f* and perforated plate *h*, for the purposes set forth.

5,395.—*Drawer-Pull Label-Holder.*—JOHN A. EVARTS and PIETRO CINQUINI, West Meriden, Conn., assignors to BRADLEY and HUBBARD, same place.—Patent No. 113,506, dated April 11, 1871. Application filed April 3, 1873.

The frame holding the label is made detachable from the pull.

Claim.—A drawer-pull and label-holder combined, when the frame which incloses the label is made detachable for the introduction or removal of the label without detaching the pull, substantially as described.

5,396.—*Pump.*—EDWARD GRASER, Union City, Pa.—Patent No. 124,434, dated March 12, 1872. Application filed March 5, 1873.

The metallic pumping-cylinder contains all the valves. The lower valve-seat is provided with a screw fitting a sleeved screw in a metallic tip on the lower section of the pump-stock. The piston has two rods, which give a purchase for unscrewing the cylinder from the tip. By this arrangement the working parts may be readily removed and replaced.

Claim.—The cylinder C, constructed substantially as described, and provided with the screw E and tip D, or their equivalents, in combination with the piston J and plunger-rod L, substantially as shown and described, and for the purposes mentioned.

5,397.—*Furnace for Smelting Iron and other Ores.*—SAMUEL W. HARRIS, Hudson, New York, assignor of part interest to BENJAMIN RAY, MILTON MARTIN, and JACOB W. HOYSRADT.—Patent No. 123,894, dated February 20, 1872. Application filed June 14, 1872.

In charging the furnace with fuel, ore, &c., the barrow conveying it is pushed against the door, which swings inward, allowing the fuel, &c., to be dumped into the furnace. When the barrow is withdrawn the door swings back by its own weight, closing the furnace, so that gases evolved may be conducted off by a proper outlet, and used as desired.

Claim.—1. The cover applied to the head of a blast-furnace, and provided, substantially as herein described, with one or more charging-apertures and swinging doors for closing the same.

2. The escape-opening *b* and regulating-damper, in combination with the cover and its opening and closing charging-apertures, substantially as and for the purpose herein described.

5,398.—*Steam-Boiler and Furnace.*—GEORGE W. LASCELL, Syracuse, N. Y., assignor to himself and HUGH ROBINSON, Jersey City, N. J.—Patent No. 133,161, dated November 19, 1872. Application filed March 24, 1873.

The fuel is consumed in the external furnace, the products of combustion passing through flues into the central combustion-chamber, to which air is supplied through register in its bottom, and thence following the direction of the arrows to the chimney. The water is caused to circulate through the double walls of the exterior furnaces and zigzag pipes located in front of their exit flues before entering the main boiler, in which latter a circulation is kept up by means of the coiled pipe, which also serves to retard the gases.

Claim.—1. The combination of the outside fire-chambers A and flues D thereof with a central or intermediate well for combustion of the gaseous products and the register G, arranged in relation with each other and with the boiler-surface above or body to be heated, substantially as specified.

2. The combination, with the outside fire-chambers A, the flues D, the central or intermediate combustion-well, and the register G, of the double-walled boiler E, arranged to form a water-space around said well and flues D, connecting the latter with the fire-chambers, essentially as shown and described.

3. The combination of the pipes L, dome K, pipes M, and jackets O and P with the double-walled boiler E, coiled pipe or pipes J, and one or more exterior fire-chambers or furnaces, A, substantially as herein shown, and for the purpose set forth.

4. The combination of the pipes H with the double-walled exterior open-topped fire-chambers A and with the double-walled boiler E, substantially as herein shown and described, and for the purpose set forth.

5. The combination of the coiled or zigzag pipes I with the double-walled exterior open-topped fire-chambers A and with the flues D leading through the double walls of the boiler E, substantially as herein shown and described, and for the purpose set forth.

5,399.—*Whiffletree Snap-Hook.*—CYRUS W. SALADEE, Pittsburg, Pa.—Patent No. 51,069, dated November 21, 1865. Application filed April 28, 1873.

The spring which actuates the hook is concealed and protected from dirt and water by a plate.

Claim.—1. The snap-hook A, constructed to operate in connection with a concealed spring and the trace-hook H, substantially as and for the purpose set forth.

2. The spring to actuate the snap-hook A, concealed within the plate B or ferrule F, substantially as and for the purpose set forth.

3. The snap-hook A, when provided with thumb-hold J, in combination with the ferrule or socket F and trace-hook H, Fig. 4, substantially as and for the purpose set forth.

5,400.—*Whip-Socket.*—ERASTUS W. SCOTT, Wauregan, Conn., assignor to himself and ARSON SEARLS, Newark, N. J.—Patent No. 70,627, dated November 5, 1867. Application filed January 16, 1873.

The curved lever, which is pivoted within a slot in the side of the whip-socket, securely clamps the whip between its curved ends and the opposite side of the socket.

Claim.—1. The combination of the stationary part of a whip-socket and a lever, the lever being hinged or pivoted so that the lever bears against the whip at or near the ends of the lever, to hold the whip in position, for the purpose set forth.

2. The lever B, curved or inclined inward from its point of pivot, and used in connection with the stationary part A, substantially as and for the purpose specified.

3. The lever B pivoted at a point inside of its center of gravity, so that when left free the upper part of the lever will fall outward, substantially as and for the purpose set forth.

INDEX OF INVENTIONS PATENTED MAY 6, 1873.

[The numbers in parentheses denote the classification of patents.]

Alarm, fire, (24,) W. A. Barnes 138,467
Auger, hollow, (29,) W. A. Clark, (reissue) 5,393
Auger, hollow, (29,) O. A. Essig 138,623
Bale tie, (7,) F. Cook 138,479
Bale tie, (7,) F. Cook 138,480

Mill, pug, (29,) D. H. Gage 138,628
Mortising machine, (173,) E. Hammond 138,649
Music leaf turner, (102,) J. B. Geyser 138,631
Musical blackboard, (146,) Thomson and Cordley 138,714
Musical instruments, sounding board bridge for, (102,) G. Woods 138,725
Nailing machine, sole, (16,) A. S. Libby 138,666
Needle, belt lacing, (72,) J. W. Smith 138,540
Organ lever coupling for hydraulic motors, (118,) H. F. Wheeler 138,546
Packing, piston, (151,) C. E. Perkins 138,690
Packing for pistons and stop valves, (152,) P. Gilfard 138,633
Packing for piston rods, &c., metallic, (151,) J. C. Furness 138,627
Pail, dinner, (88,) E. C. Luks 138,569
Paste, apparatus for making, (145,) G. G. Noah 138,519
Photographic apparatus, (111,) W. A. Leggo 138,663
Piano and other stools, (62,) R. W. Archer 138,600
Picture frames, &c., corner piece for, (54,) T. Callanan 138,611
Pins, machine for making wooden, (175,) E. C. Johnson 138,658
Pipe coupling, (167,) D. Myers 138,515
Pitcher, ice, (88,) E. A. Parker 138,686
Pitcher, molasses, (88,) W. C. King 138,591
Plane, (29,) J. C. Spencer 138,591
Plane, surfacing, (29,) G. E. Franklin 138,625
Planing machine, (173,) A. H. Shipman 138,703
Planter, cotton seed, (133,) A. D. Griswold 138,497
Plow, shovel, (114,) Johnson and Ranney 138,656
Pocket books, safety guard for, (146,) T. Potter 138,581
Pocket books, safety hook for, (146,) F. C. Likar 138,667
Press, cotton, (7,) W. H. Reynolds 138,583
Press, tobacco, (160,) F. J. Witevec 138,549
Printing press, (117,) W. A. Kelsey 138,660
Printing press, (117,) F. C. Penfield 138,689
Propulsion by gas explosions, (139,) W. A. Leggo 138,665
Pulley wheels, constructing wooden, (87,) A. Newell 138,518
Pump, (118,) J. F. Carll 138 477
Pump, (118,) E. Graser, (reissue) 5,396
Pump, steam, (118,) R. Eickemeyer 138,622
Pump, steam, (118,) G. J. Roberts 138,695
Radiator, steam, (147,) J. P. Wilson 138,722
Railroad crossing gate, (120,) W. F. Morgan 138,677
Railway crossing gate, (120,) J. B. Powell 138,527
Railway rail chair, (120,) W. A. Rowland 138,698
Range, cooking and heating, (154,) S. Teets 138,543
Reaper coupling joint, (67,) G. W. Sylvester 138,709
Refrigerator, (58,) W. M. Baker 138,553
Refrigerator, (58,) B. E. Du Val 138,488
Regulator, speed, (67,) G. W. Parker 138,523
Sash holder, (24,) J. F. Graham 138,494
Sausage stuffer, (25,) F. Mickels 138,574
Saw teeth, cotton gin, (41,) T. B. Oglesby 138,575
Sawing machine, (130,) J. T. Bagge 138,553
Separators, blast governor for grain, (159,) T. Hoge 138,561
Screen, folding, (54,) M. G. Lazarus 138,507
Screw, wood, (171,) J. K. Stockton 138,592
Sewing machine hemmer, (134,) Goodrich and Barnum 138,638
Sewing machine presser foot, (134,) H. C. Goodrich 138,637
Sewing machine tuck marker, (134,) H. C. Goodrich 138,635
Sewing machine tuck marker, (134,) H. C. Goodrich 138,636
Shears and button hole cutter combined, (44,) A. Swingle 138,542
Sheathing, joint for, (30,) N. G. Northup 138,520
Sheet metal, die for cutting and cupping, (163,) Wilson and Miller 138,721
Ship hooks, die for making blanks for, (23,) C. E. Billings 138,471
Sifter, mixer, and grinder for glass stock, (68,) Barnes and Leasure 138,554
Signal recorder, flash light, (158,) M. Gustin 138,498
Slate washer, (146,) Leet and Shields 138,662
Spinning mule, self-acting, (142,) P. McGovern 138,511
Spirituous liquors, condenser and refiner for, (47,) W. Niel 138,517
Spoke machine, (31,) R. W. Coffee 138,616
Soap, manufacture of, (26,) R. P. Thomas 138,712
Soda fountains, draft cock for, (1,) W. P. Clark 138,615
Stair rod, (24,) E. J. Smith 138,704
Station indicator, (121,) O. B. Griggs 138,496
Steering apparatus for vessels, (127,) L. Hunt 138,652
Stove, reservoir cooking, (154,) Nation and Little 138,682
Swaging machine, (60,) H. M. Crippen 138,617
Table, (62,) J. H. Wattles 138,718
Table, extension, (62,) S. H. Martin 138,571
Table, self-waiting, (62,) W. W. Patteson 138,687
Telegraph line insulator, (50,) Eby and Fenninger 138,489
Telegraph line insulator, (50,) E. A. Morrell 138,512
Thill coupling, (31,) Shipherd and Curtiss 138,702
Thrashing and hulling clover, machine for, (159,) Bradley and Nicholas 138,556
Thrashing machine straw stacking attachment, (159,) W. Carr 138,612
Tobacco cutting machine, (160,) N. H. Borgfeldt 138,606
Toilet stand, (161,) D. Sherwood 138,538
Trace detacher, (31,) W. H. Stimely 138,706
Truss, (156,) G. W. Gregory 138,640

Turpentine still, (47,) A. K. Lee 138,508
Umbrella, walking cane, (165,) E. Wright 138,726
Valve for horse troughs, &c., float, (167,) J. Jonson 138,659
Vault light, (110,) J. Wood 138,724
Vehicle seat, (31,) A. B. Sheaffer 138,537
Velocipede, (31,) G. Dismer 138,486
Wagon body, (31,) Lavies and Stiefvater 138,506
Wagon seat, (31,) J. W. Plattenburg 138,693
Wagon seat, (31,) J. Winecoff 138,598
Washing implement, (91,) C. R. Gramm 138,495
Washing machine, (91,) A. Van Allen 138,597
Watch key and screw driver combined, (36,) Reed and Day 138,698
Water meter, (167,) A. M. Rouse 138,697
Water wheel, (168,) W. C. Edwards 138,621
Wave power, (82,) C. Buckner 138,474
Wheel, traction, (94,) W. E. Bartlett 138 469
Wheel, traction, (94,) C. H. Perkins 138,578
Wheel, traction, (94,) H. T. Stith 138,707
Whiffletree coupling, (31,) W. C. Shipherd 138,701
Whiffletree snap hook, (31,) C. W. Saladee 138,699
Whiffletree snap hook, (31,) C. W. Saladee, (reissue) 5,399
Whiffletrees, &c., draft hook for, (31,) J. T. Dodson 138,619
Whip rack, (72,) J. M. Mitchell 138,676
Whip socket, (31,) E. W. Scott, (reissue) 5,400
Wind wheel, (118,) D. Halladay 138,648
Wind wheel power, (118,) L Straub 138,593
Window, (166,) J. Perkins 138,579
Work holder, (38,) R. W. Perkins 138,691
Wrench, (100,) Barry and Perkins 138,468
Zinc dross and skimmings for the manufacture of pigments, treating, (107,) F. Osgood 138,685
Zinc for pigments, manufacture of oxide of, (99,) F. Osgood 138,684

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MAY 6, 1873.

American Coal Barge Company, assignee 138,727
American Metaline Company, assignee 138,641, 138,642, 138,643, 138,644, 138,645, 138,646
Ammidon, M. M., Boiler flue scraper 138,465
Archer, R. W., Piano and other stools 138,600
Armstrong, J. G., assignee 138,693
Atwood, L. J., Lamp burner 138,601
Bagge, J. T., Sawing machine 138,552
Baker, W. M., Refrigerator 138,553
Ball, P., and B. Fitts, Water filter 138,466
Barnes, G. B., and J. A. Leasure, Sifter, mixer, and grinder for glass stock 138,554
Barnes, W. A., Fire alarm 138,467
Barnum and Goodrich 138,638
Barry and Blair 138,472
Barry, S., and F. Perkins, Wrench 138,468
Bartlett, W. E., Traction wheel 138,469
Bastet, L., Galvanic battery 138,602
Batchelder, J. H., and S. J. Sargent, Wash boiler 138,603
Bates, F. L., Cotton cultivator 138,555
Beckley, J., Churn 138,604
Bedell, S. D., Fruit basket 138,605
Bettes, A., assignee 138,494
Bigelow, S. and L. C., Potato digger 138 470
Billings, C. E., Die for making ship hook blanks 138,471
Blair, W. H., and S. Barry, Spring bed bottom 138,472
Bland, P. E., assignee 138,697
Borgfeldt, N. H., Tobacco cutting machine 138,606
Brackett, S. A., and W. W. Whitcomb, Seam for boots, &c., (reissue) 5,391
Bradley and Hubbard, assignees, (reissue) 5,395
Bradley, J., and J. Nicholas, Machine for thrashing and hulling clover 138,556
Bradt and Greene 138,560
Brightman, N. P., Steam generator 138,607
Brookman, A., Button fastening 138,608
Brooks, J. W., trustee, assignee 138,634
Brown, A., Medical compound 138,473
Brown, O. C., Loading and unloading baggage and freight cars 138,557
Brune, H., assignee 138,474
Brunswick, E., Billiard table 138,609
Bryant, A. H., Egg carrier, (reissue) 5,392
Buckner, C., Wave power 138,474
Butler, J. G., assignee 138,549
Butterworth, J., Drier 138,475
Byrnes, J., Wardrobe bedstead 138,610
Caldwell, G. S., Machine for unloading flat cars 138,476
Callahan, T., Corner piece for picture and other frames 138,611
Carr, A., assignee 138,722
Carr, W., Straw stacking attachment for thrashing machines 138,612
Carll, J. F., Pump 138,477
Casilear, G. W., Engraving bank note plates 138,613
Casilear, G. W., Engraving bank note plates 138,614
Chase, L., assignee 138,659
Cinquini and Evarts, (reissue) 5,395
Clark, W. A., Hollow auger, (reissue) 5,393
Clark, W. P., Soda fountain draft cock 138,615
Coe, S. S., assignee 138,701, 138,702
Coffee, R. W., Spoke machine 138,616
Collier, J. W., Cooler for liquors 138,478
Conner and Wolford 138,723
Cook, F., Bale tie 138,479
Cook, F., Bale tie 138,480
Cook, F., Cotton bale tie 138,481
Cook, F., Cotton bale tie 138,482
Cook, F., Cotton bale tie 138,483
Cook, F., Cotton bale tie 138,484
Cooper, T., Lubricating cup 138,558
Corbin, P. and F., assignees 138,660
Cordley and Thomson 138,714
Crippen, H. M., Swaging machine 138,617
Curless, J. M., Excavator 138,485
Curtiss and Shepherd 138,702
Custer, G., Horseshoe calk 138,618
Davis, G. G., G. L., and J. H., assignees 138,511
Day and Reed 138,598
D'Este, J., assignee 138,660
Dick, C. J. A., assignee 138,716
Dilworth, J., and J. C. Hodgins, Condenser and feed water heater for steam engines, (reissue) 5,394
Dismer, G., Velocipede 138,486
Disston, H., & Son, assignees 138,596
Dodson, J. T., Draft hook for whiffletrees, &c 138,619
Doolittle, E. W., assignee 138,668
Doughty, S. H., Buckle 138,487
Downing, J. F., Child's chair 138,620
Doyle, W. H., assignee 138,706
Drake, M. M., assignee 138,632
Du Val, B. E., Refrigerator 138,488
Eby, P., and M. B. Fenninger, Telegraph line insulator 138,489
Edwards, W. C., Water wheel 138,621
Eickmeyer, R., Steam pump 138,622
Essig, O. A., Hollow auger 138,623
Evarts, J. A., and P. Cinquini, Drawer pull label holder, (reissue) 5,395
Everett, C. D., Felly plate 138,624
Farr and Van Horn 138,545
Fenninger and Eby 138,489
Feyh and Schlich 138,534
Field, E. S., Spring bed bottom 138,490
Field, E. S., Spring bed bottom 138,491
Field, W. D., Cotton bale tie 138,492
Fischer, E. J., Stamp for cutting out figures 138,559
Fitts and Ball 138,466
Folk, J. E., assignee 138,721
Franklin, G. E., Surfacing plane 138,625
Frasier and Lamb 138,585
Frey, J. A., Soldering furnace 138,626
Fritts, C. E., Curtain fixture 138,493
Fulghum and Garreteon 138,639
Furness, J. C., Metallic packing for piston rods 138,627
Gage, D. H., Pug mill 138,628
Gaggin, R., Deodorizing oils obtained from acid tar of oil refineries 138,629
Gardiner and Mott 138,679
Garreteon, E. K., and W. Fulghum, Bed bottom 138 631
Gervis, F. X., assignee 138,591
Geyser, J. B., Music leaf turner 138,631
Gibson, W. G., Wash boiler 138,632
Giffard, P., Packing for pistons, &c 138,633
Glidden, C. W., Machine for forming boot heels 138,634
Goodrich, H. C., Sewing machine tuck marker 138,635
Goodrich, H. C., Sewing machine tuck marker 138,636
Goodrich, H. C., Sewing machine presser foot 138,637
Goodrich, H. C., and R. Barnum, Sewing machine hemmer 138,638
Gould, H., Belt lacing gage 138,639
Graham, J. F., Sash holder 138,494
Gramm, C. R., Washing implement 138,495
Graser, E., Pump, (reissue) 5,396
Greene, J. S., and T. D. Bradt, Carpet stretcher 138,560
Gregory, G. W., Truss 138,640
Griggs, O. B., Station indicator 138,496
Grimmer, H. A., assignee 138 674
Griswold, A. D., Cotton seed planter 138,497
Gustin, M., Flash light signal recorder 138,498
Gwynn, S., Journal box lining 138,641
Gwynn, S., Journal box lining 138 642
Gwynn, S., Journal box lining 138,643
Gwynn, S., Journal box lining 138,644
Gwynn, S., Journal box lining 138,645
Gwynn, S., Journal box lining 138,646
Haag, G. H., Potato digger 138,561
Hadley, E., Egg beater 138,64
Halladay, D., Wind wheel 138,648
Hammond, E., Mortising machine 138,649
Harris, S. W., Furnace for smelting iron, &c., (reissue) 5,397
Hayes, J. V., Hydrant 138,562
Hodgins and Dilworth, (reissue) 5,394
Hoge, T., Blast governor for grain separators 138,563
Holly, E. P., Fluting machine 138,650
Holmes, J. H., assignee 138,691
Hoyland, W., Reverberatory furnace 138,564
Hoysradt, J. W., assignee, (reissue) 5,397
Huggett, J. and J. A., Roll for rolling iron for horseshoe nails 138,499
Hughes, H., Brick machine 138,651
Hunt, L., Steering apparatus for vessels 138 652
Irwin, J. H., Lamp 138,653
Irwin, J. H., Lamp 138,654
Isbell, J. L., Hoisting apparatus 138,655
Isburgh, C. H., assignee 138,530
Johnson, E. C., Machine for making wooden pins 138,658
Johnson, J. O., Fluid meter 138,657
Johnson, W., and M. Ranney, Shovel plow 138,656
Jonson, J., Float valve for horse troughs, &c 138,659
Kallmes, J., Treating gold and silver ores 138,500
Kellogg, W. S., assignee 138,651

Kelsey, H., Fruit gatherer 138,565
Kelsey, W. A., Printing press 138,660
King, W. C., Molasses pitcher 138,501
King, W. C., Jelly jar 138,502
King, W. C., Candy jar lid 138,503
Kinzer, J., Seal lock 138,566
Kirsbet, J., Obtaining bisulphide of carbon from gas lime, &c 138,504
Kretchmer, E., Bee hive 138,661
Lamb, C., and T. J. Frazier, Machine for trimming lumber 138,505
Lascell, G. W., Steam boiler and furnace, (reissue) 5,398
Latham, C. H., assignee 138,538
Lavies, H., and H. Stiefvater, Wagon body 138,506
Lazarus, M. G., Folding screen 138,507
Learned, E. A., assignee 138,513
Leasure and Barnes 138,554
Lee, A. K., Turpentine still 138,508
Leet, D. W., and W. C. Shields, Slate washer 138,662
Leggo, W. A., Photographic apparatus 138,663
Leggo, W. A., Canal boat 138,664
Leggo, W. A., Propulsion by gas explosions 138,665
Lehner, J., Automatic fan 138,567
Leighton, J. E., Lamp 138,509
Libby, A. B., Sole nailing machine 138,666
Likar, F. C., Safety hook for pocket books 138,667
Little and Nation 138,692
Littlejohn, L. Bung bush inserter 138,568
Lowe, P. N., Die for forging stay ends 138,668
Ludwig, J. H. A., assignee 138,474
Luka, E. C., Dinner pail 138,569
Mackenzie, P. W., Cupola furnace 138,510
Marchand, H. E., Safety platform for cars 138,669
Marston, H. C., Seal lock for boxes 138,670
Martin, H., Drilling machine 138,570
Martin, M., assignee, (reissue) 5,397
Martin, S. H., Extension table 138,571
Matthews, J., Apparatus for cooling and dispensing beverages 138,671
McClung and Sharp 138,536
McDonald, D. C., Horse hay fork 138,572
McGovern, P., Self-acting spinning mule 138,511
McGuire, T. D., Cigar mold 138,672
McNeill, T. E., Feeding and returning condensed water to steam boilers 138,673
Merrell, E. A., Telegraph line insulator 138,512
Michener, E. P., assignee 138,527
Mickels, F., Sausage stuffer 138,674
Middleton, A., Jr., Car spring 138,675
Miller and Wilson 138,721
Mills and Wightman 138,547
Milton, C. C., Fire escape 138,513
Mitchell, J. M., Whip rack 138 676
Moffit, J. W., Brake shoe 138,514
Morgan, T. K., assignee, (reissue) 5,394
Morgan, W. F., Railroad crossing gate 138,677
Morris, G. W., Railroad car brake 138,678
Most, W., Picket fence 138,573
Mott, T. P., and S. Gardiner, Jr., Electrical gun cartridge 138,679
Munger, W. T., Mortise door latch 138,680
Myers, D., Pipe coupling 138,515
Myers, M. N., Cap 138,681
Nation, D. H., and E. C. Little, Reservoir cooking stove 138,682
Nebinger, G. R., Fruit drier 138,516
Neil, W., Condenser and refiner for spirituous liquors 138,517
Newell, A., Constructing wooden pulley wheels 138,518
Newton, R., Can filler 138,574
Nicholas and Bradley 138,556
Noah, G. G., Apparatus for making paste 138,519
North British Rubber Company, assignee 138,460
Northup, N. G., Joint for sheathing 138,520
Oglesby, T. B., Teeth for cotton gin saws 138,575
Omensetter, E., and J. F. Parker, Compound tool 138,683
Ord, W., Steam engine governor 138,521
Osgood, F., Manufacture of oxide of zinc for pigments 138,684
Osgood, F., Treating zinc dross and skimmings for the manufacture of pigments 138,685
Parker and Omensetter 138,683
Parker, E. A., Ice pitcher 138,686
Parker, G. W., Speed regulator 138,522
Patteson, W. W., Self-waiting table 138,687
Payne, S. J., Plastic compound for furnace lining, retorts, &c 138,688
Pendell, J. R., Wash boiler 138,576
Penfield, F. C., Printing press 138,689
Pennington, G. W., Loading railroad flat cars 138,577
Perkins and Barry 138,468
Perkins, C. E., Piston packing 138,690
Perkins, C. H., Traction wheel 138,578
Perkins, J., Window 138,579
Perkins, R. W., Work holder 138,691
Perry, G., and J. Webb, Metallurgic furnace 138,523
Peters, G. T. and G. E., Bird cage bath tub 138,692
Pigot, J., Self-closing stop cock 138,580
Pitcairn, E., assignee 138,566
Pitkin, A. P., Steam boiler water indicator 138,524
Platt, C. M., Manufacture of buttons 138 525
Plattenburg, J. W., Wagon seat 138,693
Plecker, W. J., Harvester dropper 138,526
Plume and Atwood Manufacturing Company, assignee 136,601
Potter, T., Pocket book safety guard 138,581
Powell, J. B., Gate for railway crossings 138,527
Rand, A. C., Steam boiler furnace 138,694
Ramsey and Johnson 138,656
Raub, D. C., Bedstead 138,582
Ray, E., assignee, (reissue) 5,397
Reed, G. P., and H. B. Day, Watch key and screw driver combined 138,528
Reeves, S. H., Spring bed bottom 138,529
Reiners, J., assignee 138,474
Renton, G., Harness 138,530
Reynolds, W. H., Cotton press 138,583
Roberts, G. J., Steam pump 138,695
Robinson, H., assignee, (reissue) 5,398
Rogers, C., & Brother, assignees 138,696
Rogers, H., Jr., Coffin handle 138,696
Rouse, A. M., Water meter 138,697
Rowland, W. A., Railway rail chair 138,698
Royse, C. W., Machine for cutting box stuff 138,584
Saladee, C. W., Whiffletree snap hook 138,699
Saladee, C. W., Whiffletree snap hook, (reissue) 5,399
Salisbury, A. E., and S. S. Steel, Barrel heater 138,531
Samee, C., assignee 138,633
Sargent and Batchelder 138,603
Saunders, H., Ship's lantern 138,532
Schaff, G. and J. A., Desk 138,585
Schenck, M. P., Cider mill 138,533
Schirmayer, F. J., Wash boiler 138,586
Schlick, F., and A. Feyh, Bottle filling apparatus 138,534
Scott, E. W., Whip socket, (reissue) 5,400
Scrannage, D'Este & Co., assignees 138,700
Scrannage, E., Jr., Faucet 138,700
Searle, A., assignee, (reissue) 5,400
Seidenstricker, W. H., Apparatus for making confectionery 138,587
Shannon, J., Car brake 138,535
Sharp, W. A., and C. L. McClung, Harvester attachment for dumping and shocking sheaves 138,536
Sheaffer, A. B., Vehicle seat 138,537
Sherwood, D., Toilet stand 138,538
Shields and Leet 138,662
Shipherd, W. C., Whiffletree coupling 138,701
Shipherd, W. C., and E. P. Curtiss, thill coupling 138,702

ORDER.

For all purposes of Office practice, the date of an application for a patent will be fixed at the time when—

The first fee has been paid, an acceptable drawing or model received, and a specification, properly signed, witnessed, and sworn to, filed.

After such date, and during the pendency of an application, either the drawing or model (but not both at the same time) may be withdrawn for correction, but the specification will not be permitted to be withdrawn for any purpose whatever.

M. D. LEGGETT,
Commissioner of Patents.

COMMISSIONER'S DECISIONS.

JOHN E. WOOTEN.—*Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of John E. Wooten for the reissue in two divisions of Letters Patent No.* 67,624, *for* IMPROVEMENT IN RIVETS.—*Decided December* 28, 1872.]

A patent for a process may be reissued with a claim for a part only of the process, if the same result may be obtained without employing the steps which are omitted from the claim.

A patent for making tubular rivets by coiling a flat strip of iron, and welding it, may be reissued with a claim for coiling it alone, if the welding is found to be unnecessary.

A claim for making rivets by coiling a flat strip of iron is something more than a claim for "a coil of strip iron."

A mere suggestion in the specification that the article monopolized may be used in a certain way, does not warrant the insertion in a reissue of a claim for a combination of the article with the mechanisms in connection with which it is to be so used.

THACHER, *Acting Commissioner:*

Applicant describes his invention in his patent as being a "tubular rivet made by coiling a strip of flat bar or plate iron, and then welding the same," to which construction the original claim is also limited; but he has found in practice that the welding may be dispensed with. He therefore seeks by reissue to obtain a patent without this restriction, and in Division A has claimed the rivet, either welded or not.

There is no force in the objection of the Examiner that the claim is simply for a "coil of strip iron." The claim is to a "*tubular rivet* made by coiling a strip of iron, as set forth." This is sufficiently definite, if he is entitled to leave out the welding. I think he is. If the inventor of a process finds that the same result can be obtained without carrying out the entire operation, he is entitled to the benefit thereof, and I can see no objection to his securing it, if he be a patentee, by reissue.

The decision of the Examiner in Division A is therefore overruled.

In his patent Wooten states that this rivet is "especially applicable to the securing of rail-splices and other objects on railways." In Division B of his reissue application he makes this suggestion the basis of a claim to a specific combination of tubular rivets, splicing bars and rails, which he has now described and shown for the first time. The ruling of the Examiner that this is matter foreign to the patent is undoubtedly correct. The bare suggestion of one of the uses of an article affords no ground for a claim to the combination in which it is used, unless fully shown and de-

scribed. Applicant would not have been allowed in his original patent the claim he now sets up, and he cannot have it now by reissue.

The Examiner is therefore sustained in his action on Division B of the application.

JOHN F. SHEPARD.—*Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of John F. Shepard for Letters Patent for a* SLICING, GRATING, AND SIFTING MACHINE.—*Decided November* 16, 1872.]

A patent may be granted for a mechanism so constructed that it may be used for several purposes by having different devices connected with it, each adapted to one of those purposes.

Such a patent may, it seems, include also a claim for the principal mechanism in combination with any one of the adjunct devices.

If a peculiar construction of the adjunct device is necessary to effect the combination, it may also be claimed in the same patent.

But a patent will not be granted for a combination of the principal mechanism with all the adjunct devices with which it may be thus connected, the combination with each device constituting a distinct machine, and requiring a separate patent.

THACHER, *Acting Commissioner:*

Applicant mounts a hopper upon a rack or frame, to which may be applied a slicer, a grater, or a sieve, the three being so constructed as to be interchangeable.

The claims are as follows:

"1. The construction of the rack A and hopper B, and their combination and arrangement with a slicer, grater, or sieve, substantially as and for the purposes set forth.

"2. The slicer C, composed of the frame *c*, knife *g*, slides A A, and plates *i i*, combined and arranged substantially as and for the purposes shown.

"3. The traps *s s*, in connection with a grater, substantially as and for the purpose shown."

The Principal Examiner requires a division of the application, stating that it embraces "three different inventions for three different purposes." From this decision applicant appeals to the Commissioner.

The objection of the Examiner is well taken. The question of joinder of inventions has been discussed by the Commissioner so frequently and fully, in decisions heretofore published, that the established practice of the Office ought by this time to be generally known. (Linus Yale, C. D., 1869, 110; Leopold Lehman, C. D., 1870, 70; and Abel Combs, C. D., 1871, 209.)

The decision in the case of Lehman is especially applicable to the one now under consideration.

Shepard first claims the rack and hopper in combination with a slicer, grater, and sieve, and then the specific construction of the slicer and grater separately. The first is improper because it is in effect a claim for three distinct and independent machines. When the slicer is removed, and either the grater or sieve substituted, a new machine is produced, having new functions and a different operation. To all intents and purposes, each is an independent machine, and as such constitutes the subject-matter for a separate application.

The same objection lies to the second and third claims. The construction of the grater is wholly independent of the slicer, as well as of the combination of the latter, or the sieve, with the rack and hopper.

What applicant may probably claim in one application is the construction of the rack and hopper, which enables him to use them in connection with either the slicer, grater, or sieve, and the combination of one of the latter devices with the two former. If a peculiar construction of the adjunct device is necessary to effect the combination with the main portion of the machine, it may also be claimed in the same application.

This is the utmost liberality that can be shown applicant. In its present form, his claim clearly contains subject-matter for several applications. The decision of the Examiner requiring amendment before further action is consequently affirmed.

If, however, the claim should be amended as suggested above, there would seem to be no objection to retaining all the figures of the drawing, and the description thereof in the body of the specification, unless other applications are to be made on this subject-matter.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF NEW JERSEY.

THE AMERICAN NICOLSON PAVEMENT COMPANY *vs.* THE CITY OF ELIZABETH *et al.*

[*In Equity.—Before Nixon, Judge.*—1873.]

THE NICOLSON PATENT FOR WOOD PAVEMENT SUSTAINED—PRESUMPTIONS IN FAVOR OF REISSUES—REASONABLE DILIGENCE IN MATURING INVENTION AND APPLYING FOR A PATENT—SUBORDINATION OF MERE IMPROVEMENTS.

The issue of a patent, its reissue, its extension by the Commissioner, its long use and the public acquiescence, and the judgment of competent legal tribunals where the question of its novelty was directly involved, are strong presumptions in its favor.

When the Commissioner of Patents grants a reissue the court must assume that he has examined and found that all the necessary conditions existed which authorized him to perform the act, and that the invention described in the reissue is the same as in the original.

The only exceptions to such an inference are where it appears upon the face of the patent itself that the Commissioner has clearly exceeded his authority, or where the new patent has been obtained by fraud or by collusion between the Commissioner and the patentee.

The validity of a reissue is not affected by the fact that in it the patentee has embodied a modification of his opinion as to the relative value of two differing modes of construction described in his original patent.

A caveator has a reasonable time in which to mature his invention, and if he has used due diligence he has the right to have his matured invention incorporated into his patent, and to supersede those that have intervened between the date of his first discovery and his subsequent taking out of the patent.

The question of diligence is not an absolute, but a relative one, and must be considered in reference to the subject-matter of the experiments.

Where the inventor, before applying for a patent, allowed six years to elapse in honest experiment to test the strength and durability of a wood pavement, which was laid upon a frequented road, but without exposing to the public view the mode of its construction: *Held*, that there was no such public use of the invention, or any such dedication or abandonment of it, as would void a patent subsequently issued.

Patented improvements upon an earlier patented invention cannot be used in connection with it without the consent of its owners.

This was a bill in equity, brought against the city of Elizabeth and others, for an alleged infringement of the reissued letters patent for an improvement for wood-

en pavements, granted Samuel Nicolson, August 20, 1867, the original of which bore date August 8, 1854.

The claims of the reissue are as follows:

1. Placing a continuous foundation or support, as above described, directly upon the roadway, then arranging thereon a series of blocks, having parallel sides, endwise in rows, so as to leave a continuous narrow groove or channel-way between each row, and then filling said grooves or channel-ways with broken stone, gravel, and tar, or other like materials.

2. I claim the formation of a pavement by laying a foundation directly upon the roadway, substantially as described, and then employing two sets of blocks, one a principal set of blocks that shall form the wooden surface of the pavement when completed, and an auxiliary set of blocks or strips of board, which shall form no part of the surface of the pavement, but determine the width of the groove between the principal blocks, and also the filling of said groove, when so formed between the principal blocks, with broken stone, gravel, and tar, or other like material.

3. Placing a continuous foundation or support, as above described, directly upon the roadway, and then arranging thereon a series of blocks having parallel sides endwise in a checkered manner, so as to leave a series of checkered spaces or cavities between said blocks, and then filling said checkered cavities with broken stone, gravel, and tar, or other like material.

4. I claim the formation of a pavement by laying a foundation directly upon the roadway, substantially as above described, and then employing two sets of blocks, viz.: One a principal set of blocks that shall form the wooden surface of the pavement, and an auxiliary set of blocks that shall form no part of the wooden surface of the pavement, but determine the dimensions of the tesselated cavities between the principal blocks, and then filling said tesselated cavities with broken stone, gravel, and tar, or other like material.

[*O. A. Seward* and *B. Williamson*, for complainant.

C. F. Blake and *C. M. Keller*, for defendants.]

NIXON, *Judge:*

This is a bill in equity for an injunction and an account, for an alleged infringement by the defendants of a patent granted to Samuel Nicolson, for an improvement in wooden pavements, on the 8th day of August, 1854.

The bill set forth that the said Nicolson surrendered the original letters patent issued to him as aforesaid, and obtained a reissue upon corrected descriptions and specifications December 1, 1863; that he afterward surrendered these reissued letters patent and obtained another reissue on the 20th day of August, 1867; that he died intestate on the 6th of January, 1868; and that letters of administration were duly issued to George T. Bigelow, who, as administrator, applied to the Commissioner of Patents, by petition, on the 7th day of July, 1868, for a renewal and extension of said patent, and that the same was renewed and extended for the period of seven years from the 8th day of August, 1868; that by mesne assignments in writing from the said Bigelow, administrator, &c., the complainant had become the sole owner of the said extended patent for the State of New Jersey, except so much of said State as is embraced within the corporate limits of Jersey City.

The bill further alleges that the validity of the said original and reissued letters patent has been settled and established by long and extensive use and by public acquiescence, and also by judicial determination, and that the defendants have infringed the same by constructing and using a wooden pavement or pavements in the city of Elizabeth embracing the invention or improvement contained in the last reissued letters patent, or the substantial or material parts thereof.

The answer of the defendants sets up substantially these defenses:

1. They deny that Samuel Nicolson was the original and first inventor of the improved wooden pavement described in his letters patent.

2. They allege that the reissued letters patent are fraudulent and void, as covering and including many things not invented by Nicolson, and not described and claimed in his original letters patent.

3. That the complainant's patent is void for want of novelty.

4. That the alleged invention was in public use, with the knowledge and consent of Nicolson, long prior to his application for letters patent, and that such public use worked an abandonment and dedicated the invention to the public.

5. Admitting that they had constructed and laid, and were then constructing and laying, certain wooden pavements in the city of Elizabeth, under and in accordance with letters patent granted to the defendants, Brocklebank and Trainer, dated January 12, 1869, they deny that by so doing they have infringed upon the rights of complainants.

I have examined the testimony taken by the parties, and have given to the arguments of counsel the attention which their marked ability and learning, and the large interests involved, seemed to demand; and I will briefly state the conclusions that I have reached, without stopping now to detail the reasons which led me to such conclusions.

The complainant's patent, if valid, is doubtless for a combination. The several parts that make up the structure are:

1. A continuous foundation directly upon the roadway.

2. A series of blocks, with parallel sides, standing endwise in rows, that form the wooden surface of the pavement.

3. An auxiliary set of blocks or strips of board, which form no part of the surface, but determine the width of the grooves between the principal blocks.

4. The filling of the grooves, when so formed, between the principal blocks with broken stone, gravel, and tar, or other like material.

It is not claimed that any one of these parts is new, but that in their combination they produce a new and useful result.

1. Was Nicolson the original and first inventor, or is the patent void for want of novelty?

I have carefully examined the copies of specifications and the large number of models produced, representing the pavements described in eighteen English patents issued previous to the date of the Nicolson patent; and, while nearly all of them have some one or more of its elements, I find that none of them, except perhaps the Hosking patent, to which I shall allude hereafter, suggests the combination which Nicolson has made.

There are strong presumptions in favor of the novelty of Nicolson's invention. The issue of the patent, its reissue, its extension by the Commissioner, its long use and the public acquiescence, the judgment of competent legal tribunals where the question of its novelty was directly involved—are all facts to be taken into the account.

The burden is upon the defendants to rebut and overthrow these presumptions, which, in the opinion of the court, they have failed to do.

2. Are the reissued letters patent fraudulent and void because they cover and include more than Nicolson invented, described, and claimed in his original letters patent?

The patent act authorized a surrender of the original letters, and a reissue for the residue of the term, when the patent first granted should be inoperative or invalid by reason of a defective or insufficient description or specification, or by reason of the patentee claiming in his specification, as his own invention, more than he had a right to claim as new, if the error had arisen from inadvertency, accident, or mistake, and without any fraudulent or deceptive intention. It is an appeal to the judgment of the Commissioner, and when he grants a reissue the court must assume that he has examined and found that all the necessary conditions existed which authorized him to perform the act, and that the invention described in the reissued letters patent is the same as the invention claimed in the original letters patent. The only exceptions to such an inference are where it appears upon the face of the patent itself that the Commissioner has clearly exceeded his authority, or where the new patent has been procured by fraud or by collusion between the Commissioner and the patentee.

There is no proof of fraud or collusion, and a comparison of the specification and claim of the original patent with the corrected and amended description of the two reissues, establishes the fact, I think, beyond question that he included nothing in the latter which was not fairly indicated and suggested in the former.

The original patent was for improved wooden pavements. He specifies and claims therein the invention of a pavement which may be constructed in one of two forms—either by using the long and short blocks, or "by arranging the long blocks side by side and in rows transversely of the roadway, and with spaces between each two rows of them, in each of which spaces a strip of board may be introduced, the width of the board being equal to about half the length of the blocks." As these are related to a like subject, and in their nature are connected together, and as the elements necessary for the construction of the one are substantially used in the other, no objections can be properly raised, because both forms are included in the one patent.

It is quite evident that when the first patent was applied for, and the first surrender and reissue made, the inventor attached more importance to, and expected greater results from, the former than from the latter mode of construction; but his experiments afterward changed his views in this respect, and in his reissue of August 20, 1867, his first and second claims are for the pavement with continuous transverse grooves made by the introduction of boards, for the infringement of which the present suit is brought. But such modification of opinion on his part as to their relative value does not disturb the fact that both forms were described, although imperfectly, in his first specifications.

3. Has there been such a public use of the invention, such a dedication of it to the public, or such an abandonment by the patentee, as to void the patent?

As these acts are closely related to each other in their essential qualities, and as the several questions grow out of one transaction, I shall consider them together.

The transaction was this: The inventor was the treasurer of the Boston and Roxbury Mill Corporation—a private company chartered by the Legislature of Massachusetts on the 14th of June, 1814. The act incorporating it is made an exhibit in the case, and it appears from the third section that it was authorized to make and finish a dam from Charles street, in Boston, to the upland at Sewall's Point, in Brookline; to connect the different parts thereof by bridges and causeways so as to render the same a good and substantial road, suitable for the passing of men, loaded teams, and carriages of all kinds; and, when finished, railed at the sides and furnished with lamps, to receive tolls for passing over the same. It was a private road over the dam, about thirty feet in width and one mile in length, with two bridges, and all under the exclusive control of the corporation. There was a toll-gate and house on the southerly side of the road, near one of the bridges. Nicolson was appointed treasurer of the company in 1833, and while acting in that position, to wit, on the 4th of August, 1847, he filed a caveat in the office of the Commissioner of Patents. His petition represents that "he has discovered or invented certain new and useful improvements in street or road pavements, and that he was then engaged in making experiments for the purpose of perfecting the same, preparatory for depositing at the Patent Office of the United States a correct specification thereof, in view to obtain letters patent therefor. He desires to obtain an exclusive property in his said invention or discovery, and prays that said caveat may be considered as the preliminary application or petition required by law to be made in order to obtain letters patent; and that his right in the said invention or discovery may be protected until he shall have matured the same."

In the description annexed to the caveat he states his invention or improvement to be as follows:

"Wooden blocks are cut from joists of about four inches square, one-half of which are cut eight inches long, the other half are cut four inches long. They are placed side by side on the prepared earth, the ends being upward, and in alternate position of long and short blocks, so that no two blocks of the same length will stand together, but so as to present a checkered surface. The lower ends being on a level, the upper will present alternate open squares of about four inches by four inches deep. Into said openings a small quantity of coarse salt is first put, then small broken stone is firmly rammed, so that the whole surface of the pavement is firm and level; then tar is poured over the whole surface, after which a sprinkling of sand or gravel. * * * Instead of broken stone and tar, used in the spaces above named, any other material or cement may answer as well, the design being to use something which will expand as the wood contracts, by which a hard surface prevents water from penetrating to rot the wood. * * * The earth may be prepared to receive the pavement by covering the surface with paper saturated with tar or other preventive to moisture rising to rot the under surface of the blocks."

The checkered pavement only is here specifically described, but the combination for which he afterward received his patent is suggested.

And that this combination was in his mind is proved by the fact that in the following summer, and as he stated to the witness Nutting, at his own expense, he caused to be laid on the dam opposite to the toll-house a piece of wooden pavement about seventy-five feet in length and of the width of the turnpike road, constructed in three different forms, to wit:

1. The checkered form, with long and short blocks.

2. The transverse channel form, with long blocks and strips, and with concrete filling.

3. The circular form, composed of small round logs of equal length set close together, with the intervening spaces filled with concrete. The foundation of a part was composed of boards or wood, and in other places it consisted of tar and sand. Both modes were used to ascertain, by experiment, which would best accomplish the desired results of an even solid earth bed, and a preventive of moisture being absorbed from the ground by the under blocks.

The 12th section of the act of July 4, 1836, under which the foregoing caveat was filed, authorizes any person who shall have invented any new art, machine, or improvement thereof, and shall desire further time to mature the same, upon payment of twenty dollars, to file in the Patent Office a caveat, setting forth the design and purpose thereof, and its principal and distinguishing characteristics, and praying protection of his right till he shall have matured his invention. Such caveat is filed in the confidential archives of the Office and preserved in secrecy. The obvious design of this section is to afford to inventors the opportunity of perfecting their discoveries and inventions. To prevent an abuse of the privilege, it is further provided that if an application is made by any other person, within one year from the time of filing the caveat, for a patent of any invention with which it may in any respect interfere, it shall be the duty of the Commissioner to deposit the descriptions, specifications, drawings, and model in the confidential archives of the Office, and to give notice by mail to the person filing the caveat of such application, who shall, within three months after receiving the notice, if he would avail himself of the benefits of his caveat, file his description, specifications, drawings, and model.

If no such application is made, the caveator has a reasonable time in which to mature his invention or discovery; and when his letters patent are issued, if he have used due diligence, he has the right to have his matured invention incorporated into his patent, and to supersede those that have intervened between the date of his first discovery and his subsequent taking out of the patent. (Curt. on Pat., § 270.)

It is impossible to read the testimony in reference to laying this section of the pavement upon the dam, and the conduct and declarations of Nicolson respecting it, without reaching the conclusion that he was making an honest experiment, and that the caveat was filed by him for protection while he was engaged in it. It was a private corporation, and the roadway was under his control as treasurer. It was a favorable spot to test the strength and durability of the pavement, because heavily-laden teams stopped and started in front of the toll-gate. He was not exposing to the public the mode of its construction, because that could not be learned from the portion exposed to the public view, and no one had a right to disturb it.

But he allowed six years to elapse after putting down the three forms of pavement before he applied for the patent. Was this using reasonable diligence?

The question of diligence is not an absolute, but relative one, and must be considered in reference to the subject-matter of the experiments. Could the value and practical utility of such an invention be sooner ascertained?

In all calculations as to cost, which necessarily involved the fact of durability, long use and lapse of time were essential ingredients.

In the absence of all intent, and indeed in the face of a manifest contrary intent, I am not willing to infer from the facts of the case that there was any such public use of the invention, or any such dedication or abandonment, by the inventor, as would avoid the patent afterward issued to Nicolson.

As the foregoing view of the legal effect of the caveat, and the experiments under it, and the patent afterward issued, carries the invention of Nicolson back to a period of time antedating the English patent of Hosking, it does not seem necessary for me now to consider whether or not the former infringes the latter. It will hardly be contended that when Nicolson laid on the Mill-Dam road his pavement with long blocks and transverse slips and grooves, in the month of July, 1848, he derived his knowledge of such a combination of elements from a patent, the specifications of which were not enrolled in the Foreign Office until March, 1850.

4. The only question remaining is the one of infringement. The defendants acknowledge that they have constructed and laid, and are constructing and laying, the pavement in the city of Elizabeth which the complainants, in their bill, allege infringes their patent, but justify under certain letters patent issued to two of the defendants, Brocklebank and Trainer, on the 12th of January, 1869. I have examined this patent and the specifications and claim annexed to it, and, conceding all that the patentees claim for it, its use must be regarded as an infringement of the combination embraced in the complainant's patent.

They state in their schedule that "the invention relates to improvements in wood pavements, and consists in an improved arrangement of the same, whereby the flooring is strengthened and adapted for the better securing of the vertical blocks to the flooring." They then describe the flooring, vertical blocks, strips between the blocks secured to the floor by nailing, and spaces between the blocks and above the strips filled with tar, gravel, cement, or other substance in the usual manner.

Their claim is for—

> The combination of the bed, transverse strips, and vertical blocks, when the latter are rebated, either on one or both sides, and either with dovetail rebates or otherwise, and the said strips fitted to the rebates and secured to the bed, all substantially as and for the purpose specified.

If you add to this the filling of the grooves or spaces between the vertical blocks and above the strips with some concrete substance, which must be done before the pavement is of any practical value, you have undoubtedly the Nicolson combination, having added to it, however, rebates upon one or both sides of the blocks of dovetail or vertical form, which addition it is claimed is an improvement, in more securely fastening to the flooring both the blocks and strips, and in the equalization of the pressure upon the pavement, and its distribution over a larger surface.

If it be granted that these additions are valuable improvements, they are nevertheless merely grafted upon the Nicolson patent, and cannot be used in connection with it without the consent of its owners.

The affidavits of Brocklebank and Trainer, taken in 1868, to be used upon the application of the administrator of Nicolson for an extension of the Nicolson patent, and exhibited in this case, fully disclose the estimate in which the patent was held by these defendants. They not only recognize its novelty, but are very extravagant in their praises of its utility and value. Not mentioning their specification of its merits in particular cases, they are of opinion that its general introduction into the streets of the cities and towns of the United States would save to the people in various ways, in the next seven years, from five to seven hundred millions of dollars.

If it be commendable in them to strive to make it more useful by improvements, it is hardly just that they should seek to rob such a benefactor of his race of the glory of his invention, or deprive his legal representatives of the profits from the extension, which they did so much, I doubt not honestly, to obtain.

I am of the opinion that the patent of the defendants infringes the first and second claims of the extended patent of the complainant, and that a decree should be entered according to the prayer of the bill.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,367.—*Ore-Separators.*—Granted to WILLIAM OLAND BOURNE, June 14, 1859. Hearing May 28, 1873.

24,402.—*Steam-Pressure Regulator.*—Granted to ALBERT P. PITKIN, June 14, 1859. Hearing May 28, 1873.

24,428.—*Trip-Hammers.*—Granted to BENNETT HOTCHKISS, June 14, 1859. Hearing May 28, 1873.

24,432.—*Rolling Metal for Jewelry.*—Granted to JOHN S. PALMER, June 14, 1859. Hearing May 28, 1873.

24,436.—*Railroad Bars.*—Granted to HENRY WEBB, June 14, 1859. Hearing May 28, 1873.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL P. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,473.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALMER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 906 and 907, July 3, 1860. No. 907 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABBATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHENERLY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,586.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,596.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. HARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OLIN TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brakes.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JANKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

23,309.—*Improvement in Harvesters*, granted to ISAAC S. and HENRY R. RUSSELL, March 29, 1859.

Claim.—The peculiar arrangement of mechanism, consisting of two segment bevel-wheels, G H, two spur-wheels, K K, an independently-turning heel, E, having a slotted plate, F, attached to it, and a crank-arm, I, having a turning crank-pin, J, for giving motion to the rake round the reel in the path of a vertical circle, and over the platform in the path of a horizontal circle, substantially as set forth.

23,996.—*Improvement in Surgical Instruments*, granted to DAVID AHL, May 17, 1859.

Claim.—An improved splint, made of the ingredients and in the manner set forth.

24,009.—*Improved Machine for Upsetting Tire*, granted to C. L. CROWELL and ROBERT SMITH, May 17, 1859. (CHAUNCEY L. CROWELL and WELLINGTON LOUCKS, executors of said SMITH, deceased.)

Claim.—The combination of the lever and the intermediate slide, arranged substantially as described, for the purpose of giving movement to the sliding jaw.

24,022.—*Improvement in Sewing-Machines*, granted to JOSHUA GRAY, May 17, 1859.

Claim.—1. The combination of the reciprocating bar G with its side inclines 10 and 11, and upper incline W with the feed-bar N, stop V, and adjustable stop *t*, arranged and operating as herein described, for the purpose set forth.

2. In combination with the slide-bar G, which operates the feeder, the bent lever *f*, and universally-adjustable cam I, the several parts being arranged to operate substantially as described, for the purpose set forth.

24,034.—*Improvement in Railroad Frogs*, granted to DAVID D. LEWIS, May 17, 1859; reissued January 5, 1864, numbered 1,602. (GEORGE J. CHAMBERLAIN and GEORGE H. MCCABE, executors of said LEWIS, deceased.)

Claim.—1. The ribs A and A′, curved from the throat *x* outward in both directions, as set forth, for the purpose specified.

2. The ribs A and A′, so beveled and rounded on the edge that they will conform to, or nearly conform to, the treads and flanges of the car-wheels, for the purpose described.

3. The steel point A dovetailed to the body of the frog, in combination with the tread-plate K and the block *i*, when the said tread-plate overlaps and is secured to the said point, and when the block *i* is of such a tapering or wedge-shaped form that, during the process of riveting it and the tread-plate to the body of the frog, the said block may serve the purpose of driving the point tight into its socket.

24,046.—*Improvement in Machines for Rolling Fabrics*, granted to THOMAS H. MURPHY, May 17, 1859; reissued August 6, 1872, numbered 5,029.

Claim.—The rolling or sliding shaft D, in combination with the friction or pressure roller G and windlass E, substantially as and for the purposes hereinbefore set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date May 13, 1873.]

6,647.—*Foot-Rests for Barbers' and Dentists' Chairs.*—ROBERT W. ARCHER and GEORGE W. ARCHER, Rochester, N. Y. Application filed April 30, 1873.

6,648.—*Barbers' and Dentists' Chairs.*—ROBERT W. ARCHER and GEORGE W. ARCHER, Rochester, N. Y. Application filed April 30, 1873.

6,649.—*Bolster for Knives or Forks.*—CHARLES H. CRUMP, Boston, Mass. Application filed May 7, 1873.

6,650.—*Ruffle-Stand.*—LUDWIG SUTRO, New York, N. Y. Application filed April 19, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date May 13, 1873.]

1,257.—*Medicinal Compound.*—D. RANSOM, SON & Co., Buffalo, N. Y. Application filed April 3, 1873.

1,258.—*Medicinal Compound.*—D. RANSOM, SON & Co., Buffalo, N. Y. Application filed April 3, 1873.

1,259.—*Medical Compound.*—D. RANSOM, SON & Co., Buffalo, N. Y. Application filed May 29, 1872.

1,260.—*Medicinal Compound.*—D. RANSOM, SON & Co., Buffalo, N. Y. Application filed May 29, 1872.

1,261.—*Medicinal Compound.*—D. RANSOM, SON & Co., Buffalo, N. Y. Application filed April 3, 1873.

1,262.—*Sections for the Cutters of Harvesting-Machines.*—WALTER A. WOOD MOWING AND REAPING MACHINE COMPANY, Hoosick Falls, N. Y. Application filed April 24, 1873.

1,263.—*Colors, Dye-Stuffs, Chemicals, &c.*—F. BREDT & Co., New York, N. Y. Application filed April 28, 1873.

1,264.—*Woolen Goods.*—GEORGE F. ELLIS, Terre Haute, Ind. Application filed May 5, 1873.

1,265.—*Medicinal Compound.*—HENRY W. FULLER, Chicago, Ill. Application filed May 8, 1873.

1,266.—*Flour.*—THE GALLEGO MILLS MANUFACTURING COMPANY, Richmond, Va. Application filed May 9, 1873.

1,267.—*Polishing Material.*—COFFIN, REDDINGTON & Co., New York, N. Y., also doing business in San Francisco, Cal., under the title of REDDINGTON & Co. Application filed May 5, 1873.

1,268.—*Sugar-Cured Hams.*—EVANS, LIPPINCOTT & CUNNINGHAM, Cincinnati, Ohio. Application filed April 16, 1873.

1,269.—*Rice Starch.*—WILLIAM J. RAND, New York, N. Y. Application filed April 24, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date May 13, 1873.]

ORIGINAL PATENTS.

138,729.—*Umbrella.*—JOHN B. BLAIR, Philadelphia, Pa. Application filed April 12, 1873.

The ferrule slides down over the drip-cup and has a slot which engages with a pin on the end of the umbrella-rod.

Claim.—1. The ferrule of the umbrella, adapted to cover and uncover the applied drip-cup, substantially as and for the purpose set forth.

2. The sliding ferrule with slot *a a* and the screw or pin *b*, in combination with the drip-cup and rod or stick of an umbrella, substantially as and for the purpose set forth.

138,730.—*Tucking Attachment for Sewing-Machines.*—EUGENE BOUILLON, New Orleans, La. Application filed October 23, 1872.

The material, being formed into a tuck, is folded over the adjustable guide, the distance between its free end and the presser determining the width of tuck, and the material is guided in a line parallel with the last finished tuck by means of such tuck filled with a metallic strip, and which passes freely between the adjustable guides.

Claim.—1. The plate L and adjustable guide K with its right-angled point I, when combined with the vertical and adjustable guides C D secured to the presser, and adapted to receive a tuck already made and distended by means of a metallic or other strip, all being constructed and operating substantially as described.

2. The presser-foot A, bearing the laterally-projecting bar A′, index-plate, and temper-screw B, in combination with the vertical and adjustable guides C and D, all constructed and arranged to operate as set forth.

138,731.—*Brick-Machine.*—GEORGE C. BOVEY, Chillicothe, Ohio. Application filed January 9, 1873.

The inner sides, furnished with longitudinal grooves, the plunger-shaft engaging in said grooves, elevate and depress the plunger-shaft at the proper moment within the molds, which are successively brought within the hopper and filled with clay by the rotation of the wallowers and presser-roller provided with radial channels.

Claim.—1. In a brick-machine having a reciprocating bed carrying a number of molds, the combination of molds D, followers C provided with journals *c*, and guiding grooves B′ of the longitudinal framings A′.

2. In combination with the molds, the cylindrical presser-roller L having radial channels *l*, and situated in the hopper, substantially as and for the purposes set forth.

138,732.—*Soldering-Iron.*—ALMON H. BURNHAM, Bridgeton, Me. Application filed November 1, 1872.

The rod *b* holds the cap down upon the can while the soldering-iron is pressed down and revolved upon the solder and cap.

Claim.—1. A soldering-iron, composed of the rod *b* with its handle *c*, handle *d*, sleeve *e*, space A, and hollow iron *a*, to operate as herein set forth.

2. A soldering-iron, composed of the rod *b* with its handle, the handle *d*, sleeve *e*, and space A, together with the iron *a* having the reversible tip, as herein described.

138,733.—*Washing-Machine.*—ALMON H. CALKINS, Chesterton, Ind. Application filed October 21, 1872.

In a frame is arranged a lower corrugated roller on a proper shaft and journals. Semicircular plates, with radial slots, are pro-

vided with vertical ribs, which play in grooves in the frame, and a series of small rollers have their bearings in the slots. A spring wire is arranged over the spindles of these rollers, or in eyes twisted around the spindles, and a spiral spring is attached to the lower part of the spring wire. Parallel boards extend across the lower part of the machine, and a plate or apron extends across to prevent the clothes from getting between them.

Claim.—1. The spreading-rollers D D having bearings in the radial slots *b'*, cut in the vertically-yielding pieces B B, in combination with the roller C having fixed bearings in the rigid ends A A, substantially as and for the purposes specified.

2. In combination, the rollers D D, the radially-slotted pieces B B, provided with the vertical rib *b*, the rigid and vertically-slotted ends A A, the roller C, the spring F, and the wire E, all arranged together substantially as described.

3. The apron H, arranged upon the parallel boards G G in the manner described, when the latter are attached to the ends A A, and employed in connection with the combination and arrangement of the parts included in the last foregoing claim, substantially as and for the purposes specified.

138,734.—*Washing-Machine.*—ALMON H. CALKINS, Chesterton, Ind. Application filed October 21, 1872.

In standards with vertical slots the journals of a large corrugated roller are placed, and are held by springs and a cross-bar. A series of small rollers, with their journals in radial slots of the standards, are held by a spring to bear against the large roller.

Claim.—1. In combination, the rigid pieces A, provided with the vertical slot *a*, and the radial slots *a'*, the vertically-yielding roller B having its spindle arranged in the slots *a*, and the yielding rollers E having their spindles arranged in the radial slots *a'*, substantially as and for the purposes specified.

2. In combination, the rigid pieces A, provided with the vertical slot *a* and the radial slots *a'*, the roller B having its spindle arranged in the slots *a*, the springs C, also arranged in the slots *a*, and pressing the spindle of the roller B, the rollers E having their spindles arranged in the radial slots *a'*, the spring F, arranged across the spindles of the rollers E, and the sliding bar D, arranged on the springs C, and supporting the spring F, substantially as and for the purposes specified.

138,735.—*Lid for Jelly-Glasses.*—DAVID CHALLINOR, Pittsburg, Pa. Application filed April 10, 1873.

A glass disk provided with a metallic flange, which projects down over the top edge or lid of the jelly-glass.

Claim.—1. A lid for jelly-glasses, said lid consisting of the glass disk D, and metallic flange C, substantially as herein described.

2. The hereinbefore-described lid, in combination with a jelly-glass, as and for the purpose set forth.

138,736.—*Heat-Governor or Draft-Regulators.*—FERDINAND E. CHATARD, Jr., Baltimore, Md. Application filed February 13, 1873.

The temperature of the atmosphere in an air-tight metallic tube or vessel placed in one of the apartments to be heated regulates a bell-valve, which communicates motion to the dampers controlling the draft-passages of the furnace.

Claim.—1. The draft-box A A with its two compartments N and O, and damper-plate K, when constructed and arranged to operate as hereinbefore set forth.

2. The motor D with its bell T and pipe G, when constructed and arranged to operate as hereinbefore set forth.

3. A metallic air-tight tube or vessel, H, when placed within the oven or within any of the rooms of a building to be kept at a standard temperature, which tube or vessel, by the expansion of its contents, communicates motion by suitable device, substantially as set forth, to a damper to regulate the draft and heat of an oven, furnace, or stove.

138,737.—*Motor.*—MERLIN COMSTOCK, Chicago, Ill. Application filed November 5, 1872.

Applying intermittent primary power and develop a secondary power, which will cause the terminal or driving-wheel to be rotated continuously in the same direction.

Claim.—1. The combination of the wheel B, lever E, wheel F, ratchet G, lever H, and one or more springs J, or its equivalent, in connection with a pushing-pawl and one or more stop catches or hooks, all arranged together substantially as and for the purposes specified.

2. The combination of the wheel B, lever E, wheel F, ratchet G, lever H, one or more springs, J, or its equivalent, and arms K and K', in connection with a pushing-pawl and one or more stop catches or hooks, all arranged together, substantially as described.

138,738.—*Wash-Boiler.*—SMITH COVEY and OREEN A. SLAFTER, McHenry, Ill. Application filed March 3, 1873.

A wash-boiler constructed with a false bottom, with a cap and flange extending through an opening in the center of it, and buckets extending below it, into which is fitted a wood float to control the water. A sloping conductor, perforated below its top or cap, gives direction to the water and steam, and on its top are valves or hinged doors to allow an escape of steam.

Claim.—1. The combination of the single wall or case provided with the fixed false bottom B and the perforated flue K, the removable valve-plate D provided with the canopy F and valve L, the cover M provided with one or more lids, O, all constructed substantially as shown and described, and for the purpose set forth.

2. A steam wash-boiler, provided with a fixed false bottom having an opening therein to admit of the chamber below the said bottom being cleaned, in combination with the removable cover D, arranged over the said opening, and attached to the false bottom by means of the buttons G G, substantially as specified, and for the purposes set forth.

138,739.—*Wash-Boiler.*—JOHN CRAMER, Monee, Ill. Application filed March 18, 1873.

A wash-boiler constructed with a hollow rib across its false bottom, with perforations covered by bars or grates in the opposite direction, and is supported by flanges on its side and by projections on the bottom of the conductors. The conductors are located in each corner for water and steam, with closed top and openings below for the flow of water and steam.

Claim.—The square boiler A having the perforated plates B, and the false bottom C having the hollow rib *b*, perforations *c*, grating *d*, and supports *e*, constructed and arranged as shown and described, for the purpose specified.

138,740.—*Tool for Use in Lacing Belts.*—FREDERICK N. DU BOIS, New York, N. Y. Application filed February 26, 1873.

The templet, besides making part of the clamp, serves as a ready square for trimming the ends of the belt and to properly space the lace-holes.

Claim.—The combination of the perforated templet A with the clamping-jaw B, as and for the purpose set forth.

138,741.—*Automatic Fan.*—EDWARD DUFFNER, Vicksburg, Miss. Application filed March 5, 1873.

Claim.—1. The combination, with fan-shaft E, of a clock-power, A, and wheel K, with pinion J and upright crank-shaft I, as herein shown and for the purpose specified.

2. The pinion J, the upright crank-shaft I, and connecting-rod H, when combined with a fan suspended from the ceiling of a building, as herein shown, and for the purpose described.

138,742.—*Machine for Boring Hubs.*—JOHN EISENMANN, Chicago, Ill. Application filed February 7, 1873.

The boring-bits are arranged radially about the hub and forced inward by means of an encircling cam-ring.

Claim.—1. The cam-ring G provided with the cams *f* for moving inwardly the spindles E, as shown.

2. The construction and arrangement of the frame A, driving-shaft B, friction-gear C, pulleys D, spindles E, springs *d*, ring F, cam-ring G, cams *f*, and stops h, substantially as and for the purpose set forth.

138,743.—*Machine for Sharpening Harvester-Knives.*—JOSIAH S. ELLIOTT, Chelsea, Mass. Application filed December 13, 1872.

The carriage is arranged so as to present the teeth to the wheel at the proper angle, and keep the work always under the eye of the operator.

Claim.—1. The emery-wheel B, in combination with a carriage, consisting of the slide *c* and platform E, operating substantially as described.

2. The plate *p* forming a part of the ring of the slide *c*, and operated by a screw, substantially as described, for the purpose described.

3. The set-screw *x*, in combination with the slotted table through which it passes, and the plate secured to the table by the screw *y*, substantially as described, for the purpose described.

138,744.—*Rotary Engine.*—MICHAEL EISAESSER, Brooklyn, N. Y. Application filed March 10, 1873.

Elliptic springs, bearing at their ends against the sliding pistons, pass through cylindrical pieces in slots in the revolving wheel, and they are forced apart by elliptic springs placed at right angles to the former and bearing against the cylindrical pieces, thereby making a uniform pressure on all of the pistons.

Claim.—The combination of the elliptic springs G G E E and pins J J with each other and with the pistons D D, substantially as and for the purpose hereinbefore set forth.

138,745.—*Button and Stud Attachment.*—HIRAM FREEMAN, Petroleum Centre, Pa. Application filed February 8, 1873.

Two metallic plates are hinged together at one side and have a clasp-fastening at the other. The inner edges of the plates are grooved, or grooved and recessed, to receive and embrace the shank of a button.

Claim.—As a stud or button securer, an adjustable disk to be interposed between the fabric and the small head E of the stud or button, composed of the two parts A A swinging upon the hinge *a* and provided with the grooves *c c*, which, when closed and clasped, will form the opening *z* for the transmission of the shank of a stud or button, substantially as and for the purpose set forth.

138,746.—*Child's Carriage.*—THOMAS GALT, Rock, Ill. Application filed February 19, 1873.

Means for locking the fifth-wheel of a child's carriage that the tongue may be changed from front to rear and the carriage propelled from behind.

Claim.—The fifth-wheel D of a child's carriage notched at *c*, in combination with the bolt D for locking the same, substantially as shown and set forth.

138,747.—*Portable Fence.*—LEWIS GATES, Mount Vernon, Ohio. Application filed January 13, 1873.

At each end of the panel a combination post is formed of three rails secured together, two inclined and intersecting near the top, the third horizontal near the bottom, preventing the spread of the inclined rails. When the legs on or in the ground decay the whole panel may be reversed, bringing sound ends to the ground, and the decay may be cut off the ends thus brought to the top.

Claim.—The fence-post, consisting of the pieces A D C, so arranged that the extremities of each will project beyond their

points of intersection and permit the reversal of the panel, substantially as and for the purposes herein set forth and shown.

138,748.—*Car-Coupling.*—MARTIN GOOLAVEN, Taunton, Mass. Application filed August 15, 1872.

The draw-head is provided with a frame in which works a cross-head which has a catch for engagement with the coupling-link, and a rod which passes up through the frame and acts as a keeper for a spring which forces the catch down. The cross-bar is raised by levers on either side, or by a cord passing up to the top of the car.

Claim.—In combination with the draw-bar of a car the spring-catch C H, to operate by means of the lever or levers S K or G, substantially as and for the purpose specified.

138,749.—*Roller for Window-Curtains.*—WILLIAM W. GRIER, Hulton, Pa. Application filed April 8, 1873.

The rollers are made of sheet metal, bent into the form of a tube, each end of which has screw-threads adapted to screw into threads formed inside of tubular caps or ends. These caps or ends are provided with pintles which serve as an axis for the roller. The curtain is clamped between the edges of the tube.

Claim.—A sheet-metal tubular roller, A, the ends of which are furnished with screw-threads, in combination with the tubular end pieces B, constructed and operating with relation to each other, substantially as herein described, and for the purpose set forth.

138,750.—*Glass-Press.*—JONATHAN HALEY, Pittsburg, Pa. Application filed April 24, 1873.

Pulley-shaft rotating continuously and gearing into crank-shaft operating the plunger. Cam arranged on gear-wheel of crank-snaft so as to ship pulley at certain point of revolution and so stop plunger. Plunger yielding so as to accommodate itself to varying thickness of glass.

Claim.—1. A power-press for molding glassware, in which the reciprocating parts that operate on the mold are actuated from or by a crank-shaft having a continuous rotary movement in one direction during the operation or working of the press, substantially as and for the purpose herein shown and set forth.

2. In a press for molding glassware, a reciprocating plunger, arranged to act on the material in the mold with a yielding pressure, which admits of its automatically adapting itself to variations in the quantity of glass in the mold, substantially as shown and set forth.

3. The combination, in a glass-press, of a crank-shaft, continuously rotating in one direction during the working of the press, and a reciprocating plunger connected with and deriving its movement from said crank-shaft, and automatically self-adjustable to variations in quantity of glass in the molds upon which it acts, substantially as and for the purposes described.

4. In a power-press for molding glassware, the combination, with the rotary crank or driving shaft which actuates the reciprocating plunger, of a stopping and starting mechanism, arranged and operating substantially as herein shown and described, whereby the movement of said crank-shaft may automatically be arrested in order to stop the movement of the plunger at any given point or points in its ascent or descent, as and for the purposes set forth.

5. The combination, in a glass-press, of the following elements, namely, a rotary crank or driving shaft, a reciprocating plunger deriving its movement from said shaft, and automatically self-adjusting to variations in quantity of glass in the molds, and a stopping and starting mechanism, whereby the movement of said shaft, and consequently of the plunger, may be arrested automatically at any given point or points, substantially as herein shown and set forth.

6. The combination of the plunger-rod, spring-box, cross-head, plunger, and spring or elastic cushion within said box, the same being arranged together for joint operation, substantially as shown and set forth.

7. The combination, with the spring-box, its inclosed spring, and the plunger, of the presser-plate, adjustable to regulate the compression of said spring, and its consequent pressure upon the plunger, substantially as and for the purposes shown and set forth.

8. In combination with the reciprocating plunger and the bed-plate, the sliding mold guide-plate, moving in guides or ways on the bed-plate, and arranged with relation to the plunger substantially as shown and set forth.

9. The herein-described stopping and starting mechanism, constructed and organized as set forth, in combination with the crank-shaft and the driving-shaft, under the arrangement and for operation substantially as shown and specified.

138,751.—*Powder and Shot Charger for Fire-Arms.*—ALBERT HALL, New York, N. Y. Application filed October 1, 1872.

Combination of an adjustable sliding-charge gage with a gate and operating-lever, as shown, so that the slide and gate may be moved together and without detaching any of the parts.

Claim.—1. The combination, with the discharge-tube A and cross-slides B B', of the side opening *g* in said tube, and the slotted outer longitudinal slide D, arranged to cover the opening *g*, and receiving the one cross-slide through it for adjustment within the opening *g* in direction of the length of the discharge tube, substantially as and for the purposes herein set forth.

2. The thumb-lever C, in slotted or free connection with the adjustable cross-slide B, in combination with the slotted longitudinal slide D and discharge-tube A, provided with an enlarged side opening, essentially as specified.

138,752.—*Bag-Holder.*—JOHN HUNTER and HENRY M. CLAYTON, Ashland, Pa. Application filed April 1, 1873.

Mouth of bag turned down over bent arms arranged at right angles to the supporting-bar; turning the arms outward holds the bag open more firmly by the increased strain on them caused by filling the bag.

Claim.—The bent arms B B' pivoted to a support, A, and operating as shown and described.

138,753.—*Shaft-Iron for Carriages.*—WILSON W. KNOWLES, Plantsville, Conn., assignor to ATWATER MANUFACTURING COMPANY, same place. Application filed March 1, 1873.

Welding the iron at the joint made by the shaft and cross-bar is obviated.

Claim.—As an article of manufacture, the T-shaped shaft-corner iron A B C, its under side being flat, the same being formed solid at the junction of the arms by cutting from a single piece of wrought metal, substantially as specified.

138,754.—*Brick-Machine.*—HENRY MARTIN, Chicopee, assignor of one-half his right to WILLIAM C. MCCALLAN, Springfield, Mass. Application filed March 19, 1873.

A main lever imparting movement to a sliding center, so as to permit the order of the main lever to be changed by transferring its former fulcrum to the end of the connection when the passage is obstructed; the obstruction being removed, the lever is returned to and held in its former place.

Claim.—In combination with lever E having the sliding center T, the friction-wheel B having cord and weight c W, hub and cord *d m*, operated by the lever D, with friction-band A the parts being arranged and constructed substantially in the manner and for the purpose shown and described.

138,755.—*Window-Sash.*—WILLIAM L. MCDOWELL, Philadelphia, Pa. Application filed April 6, 1873.

A means of retaining the glass in its place in the sash, so that it can be inserted and removed at pleasure, by the construction of the sash itself, without the use of putty.

Claim.—1. In combination with the montants or uprights A, the flanges or projections *a' a''*, or their equivalents, arranged in relation to each other substantially as and for the purpose hereinbefore set forth and described.

2. In combination with the flanged montants or uprights A, the cross-pieces C C, when constructed with the water-table *c''* and the raised portion *c'*, substantially as and for the purposes hereinbefore set forth and described.

138,756.—*Bedstead.*—HARMON D. OLDS, Cedar Rapids, Iowa, assignor of two-thirds his right to CHARLES J. BAYER, same place. Application filed February 13, 1873.

An angular metallic brace is secured to the side rail of the bedstead in which is fitted transverse rails with dovetail ends, which strengthen the bedstead.

Claim.—The bent metallic plate D with its ends projecting beyond its bed or bearer A, and secured in the bearer-mortise to form an endwise brace to the bedstead, as described and shown.

138,757.—*Spring for Rocking-Chairs.*—ALBERT H. ORDWAY, Haverhill, Mass. Application filed March 25, 1873.

The seat is supported on two pairs of curved springs, the upper end of each spring provided with a longitudinal slot to receive the bolt that confines it to the seat, so as to adjust the length of the spring. Each pair of springs is connected by a center-brace, through openings in which each separate spring passes. The side braces are connected to each other by an arched brace that is secured at its center to the under side of the seat. Brakes or stops are attached to the lower frame for the purpose of preventing the lower parts of the rear springs from bending too much.

Claim.—1. In combination, with the seat *a* of a chair, cradle, &c., and the frame *b*, the springs *c c'* having slot-holes in their upper ends, of the screw-bolts *d d'*, and thumb-bolts *e e'*, or their equivalents, as and for the purpose set forth.

2. The combination of the springs *c c'*, arched brace *f*, and the braces *g g* having each two openings, *i i*, in a manner set forth.

3. In combination with the frame *b*, seat *a*, springs *c c'*, of the brake or stopper *k*, as and for the purpose set forth.

138,758.—*Manufacture of Door-Knobs.*—JOSEPH OTTKER, Bridgeport, Conn. Application filed April 7, 1873.

The two shells of a knob are united, by a ring of metal cast around the joint, into grooves previously cut.

Claim.—1. The method of casting and preparing the shells for metallic knobs, as described and set forth.

2. The uniting of the shells of a metallic door-knob by a metal ring cast to the parts and finished, as described and set forth.

138,759.—*Medical Compound or Blood-Purifier.*—DANIEL PARLOW, Philadelphia, Pa. Application filed April 9, 1873.

Cinnamon bark, boneset, sassafras bark, wood-dittany, and May-apple root and water.

Claim.—The composition or compound consisting of the ingredients named in the proportions hereinbefore specified, prepared, substantially as described, for the purposes set forth.

138,760.—*Boom and Raft Rudder.*—LEVI W. POND, Eau Claire, Wis., assignor to himself and THE EAU CLAIRE LUMBER COMPANY OF WISCONSIN. Application filed September 9, 1872.

A steering boom-raft has pivoted to its sides leaves or rudders which are controlled in their relative position to the boom by steering-lines. The raft is steered to the larboard or port side, according to the position of said rudders.

Claim.—Rudder C, with end pieces D and E, in combination with stationary support B and rope F, substantially as described.

138,761.—*Inside Blind.*—WILLIAM POTTER, Jr., Andover, N. Y. Application filed March 17, 1873.

An arrangement of cords and pulleys by which the slats are elevated or opened, as desired, or one end of the slats may be

raised, giving a fan-shape to the blinds. The slats are attached to the side cords by a short cord that passes underneath each slat, with its center carried up through an opening in the center of the slat and held there by a pin.

Claim.—1. The arrangement and use of the pulleys *e f h i*, to operate in combination with the cords B B, *g g*, *c c*, and *b b*, as and for the purpose described.

2. The above arrangement of the cords and pulleys, in combination with the small cords *k k* fastened by the pin *i* to the slats *a*, by which means the blinds are raised and lowered, or shut or opened, as hereinbefore specified.

138,762.—*Stave-Jointer.*—JOHN J. RALYA, Cleveland, Ohio. Application filed November 29, 1871.

A revolving wheel having a slightly-concave face is provided with suitable cutting-bits. The stave is secured upon an oscillating table and pressed against the face of the wheel until the cutters have reduced it to the proper shape.

Claim.—1. The adjustable frame K, hangers M, links O attached to the arms P of the shaft N, combined and arranged to operate in the manner as described and in relation to the wheel B, for the purpose specified.

2. The clamps Q, levers S, links T, slide U, standard V, friction-rollers *a*, and treadle A', as arranged to operate in combination with each other and in relation to the rests or tables E, substantially in the manner as described, and for the purpose set forth.

138,763.—*Wire-Fence.*—HENRY M. ROSE, Waterman Station, Ill. Application filed December 31, 1872.

An attachment to an ordinary wire-fence, consisting of a bar of wood having barbs radiating from it, the said bar suspended from the horizontal wire (one or more) by means of wire bands.

Claim.—The combination of wooden strip C with metallic points D, and wire bands E with the wires B and posts A of an ordinary wire-fence, as and for the purpose described.

138,764.—*Shoe-Sewing Machine.*—JOHN G. ROSS and THOMAS L. MILLER, Philadelphia, Pa., assignors to JUSTUS W. FRENCH, VIVIAN K. SPEAR, BENJAMIN DORE, and WILLIAM F. MORGAN, Lynn, Mass. Application filed October 18, 1872.

Designed for sewing "turns." The rest and channel-opener projects upward from a horizontally-reciprocating bar, which also carries the bevel-sole guide, and these parts, together with the presser-foot, sustain the sole in position, and the upper in position about the sole, and produce the feeding action. The upper presser-foot is secured to the plate hinged to the stock, and is adjustable laterally as well as horizontally with reference to the rest and edge of the sole. The oblique presser-foot presses on the upper and edge of the sole and holds the latter down on the rest and against the sole-guide, which presses against the bevel of the sole.

Claim.—1. The combination of the rest and channel-opener E with the feed-bar D and presser-feet I and I' for feeding the shoe forward and holding it for the sewing operation, substantially as and for the purpose specified.

2. The combination of the upper presser-foot I, plate J, stock K, and set-screw *f*, substantially in the manner and for the purpose above described.

3. The oblique presser-foot I' in combination with the rest E and bevel sole-guide G, substantially in the manner and for the purpose set forth.

138,765.—*Basket-Form.*—ANTON F. SCOW, Chicago, Ill. Application filed February 10, 1873.

The clamp X pivoted to one standard and fastened to the other, and by a dependent spring-rod holds the bottom of the basket to the form M.

Claim.—The curved clamp X with stationary or adjustable standards C, when used to hold the bottom J to form M, substantially as and for the purpose set forth.

138,766.—*Gas-Fixture.*—GEORGE G. SHELDON, Chicago, Ill. Application filed April 12, 1873.

The drop-light tube-nozzle extends from the burner-pillar down under the globe. A valve is so arranged that gas may be admitted to either the drop-light, the attached burner, or to both. The flexible pipe is attached to the nozzle by a sleeve, the arms of which engage upon a rim of the nozzle, and is made gas-tight by a coiled spring and rubber ring.

Claim.—1. The hereinbefore-described arrangement, substantially as shown and specified, of a tube-receiving nozzle in a gas-fixture, for the purposes set forth.

2. In a gas-fixture, a tube-receiving nozzle having a bifurcated channel and provided with an adjustable valve or cock arranged at the junction of the channels for the purpose of controlling and shifting the flow of gas through either and both channels, substantially as and for the purposes specified.

3. As a new article of manufacture, a gas-fixture attachment, consisting of a tube-receiving nozzle having a bifurcated channel, and provided with an adjustable valve or cock arranged at the junction of the channels for the purpose of shifting the flow of gas both through a burner-tip arranged on the fixture and through a drop-light, and through either.

4. The nozzle D having the bifurcated channel D' D'', constructed and arranged substantially as described, and provided with the thumb-screw F, also constructed and arranged substantially as described, for the purposes set forth.

5. The arrangement, substantially as described, in the channel of a drop-light tube-receiving nozzle, of an adjustable valve or cock for the purpose of shifting the flow of gas both to a burner-tip on the fixture and to a drop-light, and to either.

6. The drop-light tube E' provided with the bent arms or clasps *e e*, in combination with a tube-receiving nozzle provided with the open and beveled shoulders or ribs *u u* and with the washer *r*, arranged to receive and engage the end of the tube E, substantially as and for the purposes specified.

7. The combination and arrangement of the tube E' provided with the shoulder *s*, sleeve G provided with the bent arms or clasps *e e*, spring *t*, open shoulders or ribs *u u*, and washer *r*, all substantially as and for the purposes specified.

8. In a gas-fixture, a tube-receiving nozzle, in combination with a valve or cock for shifting the flow of gas both through the fixture and the nozzle, and through either, substantially as and for the purposes specified.

138,767.—*Apparatus for Painting or Coating Broom-Handles, Moldings, &c.*—STEPHEN A. SHEPARD, Pittsburg, Pa. Application filed April 16, 1873.

Claim.—The wiping or coating apparatus hereinbefore described, viz., the elastic sheet A, provided with opening D and secured to the frame B, in combination with a vessel containing a painting or coating material, as and for the purpose specified.

138,768.—*Coffin-Handle.*—CLARK STRONG, Winsted, Conn. Application filed April 17, 1873.

The end of the thin metallic tube, which constitutes the handle proper, is inserted in the lever-socket, and the metallic tip is then driven forcibly into it, crowding together and securing the three parts without rivets or solder.

Claim.—Fastening together the tubular hand-piece A, the swinging lever B, and the tip C by means of the inner pressure of the plug end of the tip and the outer pressure of the ring *d* of the swinging lever, the ring being first forced upon the end of the tubular hand-piece, and then the plug end of the tip being forced into the end of the tubular hand-piece, substantially as set forth.

138,769.—*Table-Leaf Support.*—GEORGE C. THOMAS, Chicago, Ill. Application filed April 12, 1873.

The support is constructed in two parts, one of which is adapted to be secured on the under side of the bed of the table; the other part is hinged to the permanent part of the support so as to support the leaf when extended, and to fold under the bed of the table when closed.

Claim.—An improved table-leaf support formed by combining the parts A A' and shaft C, constructed and arranged substantially as described.

138,770.—*Manufacture of Artificial Hydraulic Cement.*—WILLIAM B. TUCKER, Baltimore, Md.; assignor to FRISBY LLOYD, same place. Application filed October 25, 1872.

Blue river, pit, or other clays that contain some or all of the following substances, viz.: Silica, alumina, oxide of iron, manganese, or corundum, combined with them naturally or chemically, in combination with any lime or limes, either in the carbonate or caustic state, which has absorbed hydrogen, sulphurous or sulphuric acid while purifying gas. The whole ground, mixed, and heated to 125° Fahrenheit and then molded.

Claim.—1. Clays containing silica, alumina, oxide of iron, manganese, or corundum, or clays having these substances added in proper proportions, in combination with the limes herein set forth, for the purpose of manufacturing artificial hydraulic cement.

2. The refuse limes herein set forth—*i. e.*, from the manufacture or purification of gas, and from the manufacture of lye—for the purpose herein described.

3. Treating the materials herein set forth in the manner herein described, in the manufacture of hydraulic cement.

138,771.—*Binder's Attachment for Harvesters.*—THOMAS WEBB, Freeport, Ill. Application filed September 23, 1872.

The binding-tables are arranged so as to admit of three binders operating at the same time.

Claim.—The combination of the tables A and B B, platform D, and wheel E, when said parts are constructed and arranged substantially in the manner and for the purposes herein set forth.

138,772.—*Binding-Folder.*—ELLIOTT P. WEST, Jersey City, N. J. Application filed April 10, 1873.

The binding material is received within the curvilinear opening of the guide, from which it passes between the jaws, one of which is secured to the cloth-plate, while the other is made to reciprocate so as to pinch the material partially folded and closely fold it near each edge, and then the material, with edges folded, is passed to the binder of ordinary construction, which folds it centrally and applies it to the material to be bound.

Claim.—1. The combination of guide A and jaws B and C, when operated together, substantially as and for the purpose specified.

2. The combination of jaws B and C and binder K, operating together substantially as specified.

3. The combination of guide A, jaws B and C, and binder K operating together, substantially as specified.

138,773.—*Painting Striped Awnings.*—CHARLES E. WHEELER, Boston, Mass. Application filed March 22, 1873.

The cloth to be striped is first passed through a solution of soap or alkalies in water to prevent the paint from spreading on the cloth beyond the stripe.

Claim.—1. In combination with the elastic pressure-roller *c d*, screw *h i*, and bar *k*, or their equivalents, of one or more pattern-rollers, *f f'*, partially immersed in the oil-paint contained in the boxes *g g*, for the purpose of striping awnings, &c., with oil-paint, as herein shown and described.

2. In combination with the oil-striping apparatus herein described, the sizing-machine consisting of the trough *p*, immersed roller *q*, rollers *t*, *r*, and *u*, as and for the purpose set forth.

3. As a new article of manufacture, awning-stripes, painted by machine in oil-colors, in the manner herein shown and described.

4. The process of manufacturing oil-colored striped awning, as herein shown, and for the purpose set forth.

138,774.—*Tent-Frame.*—WILLIAM W. WHITCOMB, Boston, Mass. Application filed January 3, 1873.

The pole is made in two or more sections, which slide telescopically one within the other. At or near the top of the upper section is a movable head-block, to which radiating arms, which support the canvass, are hinged or pivoted. The tent may be raised or lowered by means of pulley or friction wheels and a cord.

Claim.—1. A center-pole for a tent or other like purpose, having two or more sections sliding one into the other, in combination with a movable head-block, in which radiating arms may be fixed or hinged.

2. In a center-pole for a tent or other like purpose, in two sections, sliding one into the other, the pulley-wheels B and C, and the grooves A, and the grooves opposite, whether said grooves are in the upper or lower section of said pole.

3. A frame for a tent or other like purpose, consisting of a center-pole, in two or more sections, sliding one into another, and capable of being raised or lowered and fixed at any point of height, and a movable head-block having hinged radiating arms.

138,775.—*Process in Casting in Metallic Molds.*—JOHN WILLIAMS, Philadelphia, Pa., assignor to EDWIN CHAMBERS and CYRUS CHAMBERS, Jr. Application filed January 14, 1873.

Red lead is applied to the interior surfaces of the molds to prevent the fluid metal from adhering thereto.

Claim.—A coating formed of red lead, (minium,) and applied to the surfaces of metallic or other molds or metals around, in, or against which other metals are to be cast, for the purpose herein specified.

138,776.—*Apparatus for Improving Liquors.*—CHARLES WOLTERS and IGNAZ RUDIGIER, Pittsburg, Pa. Application filed September 5, 1872.

The plates of glass are placed in the heads of the revolving vessel.

Claim.—1. The light-inducting glasses *d*, in combination with a vessel A, when used in aging and purifying alcoholic liquors, constructed in the manner set forth and described.

2. Vessel A, in combination with the hollow axis F and worm of the condenser *n*, for the purpose to condense the alcoholic vapors, and to produce an air-current through the liquors without the use of an air-pump, when used in aging and purifying alcoholic liquors, constructed in the manner described.

138,777.—*Rock-Drilling Machine.*—DE VOLSON WOOD, Hoboken, N. J. Application filed February 14, 1873.

The main valve is operated by means of a piston within a secondary cylinder. This cylinder is also provided with a valve, which is operated by means of a valve-stem, the end of which rests upon the inclined surface of the main piston. A spiral groove around the valve-stem serves to govern the action of the auxiliary valve. A false head is arranged within the main cylinder, forming thereby a space for the reception of steam which forms a cushion for the piston.

Claim.—1. The combination of the main valve K, piston I, valve G, piece F, and conical surface *b b*, arranged and operated substantially as described, and for the purposes herein set forth.

2. The combination of the valve G, the spiral groove *g h* in the valve-rod F, and the adjusting-rod *p* or its equivalent, arranged and operated substantially as described, for the purpose of regulating the stroke of the piston B B.

3. The inclined sides *b b* and *b c*, arranged between the heads of the piston B B, in combination with the rod E, valve-stem F, and valve G, as and for the purposes specified.

4. A regulated hand-feed, consisting of the combination and arrangement of the crank Y or its equivalent, screw T, ratchet V, click *v*, and projection W, substantially as described.

5. In a direct-acting rock-drilling machine, the false head N, arranged to form a space, *r*, in combination with the valve *s* and passage *t*, as and for the purposes specified.

138,778.—*Gas-Generator.*—JOSEPH S. WOOD, Brooklyn, N. Y., assignor of one-half his right to JOHN J. CARBERRY, Philadelphia, Pa. Application filed March 25, 1873.

A pipe allows the acid to be forced back from the generating-chamber to the acid-chamber, and, by projecting below the perforated plate, has its end sealed by the dilute acid remaining in the bottom of the tank, so as to prevent the gas entering the acid chamber.

Claim.—1. The perforated false bottom *d*, in combination with a communicating passage, E, for the circulation of dilute acid controlled by a plug or valve, *g*, the said passage having its lower termination at or below the said false bottom of the generating-chamber and the other end terminating in the acid-chamber, as herein described.

2. The circulating pipe E having its lower termination below the level of the iron-turnings contained in the gas-generating chamber and the other termination in the dilute acid chamber, and controlled by a plug or valve therein, substantially as herein described.

138,779.—*Watch-Key.*—FRANCIS E. ALLEN, Keene, N. H., and SAMUEL G. HALL, Winchendon, Mass. Application filed March 10, 1873.

The steel pipe or barrel is attached to the brass tubular stem by being forced through it from the top and secured by a constriction of the brass stem just above it. The key is finished with a cap or cover soldered to the top of the stem.

Claim.—The within-described method of making watch-keys, by forcing a steel pipe, having upon its enlarged upper portion serrations or splines, partly through a tapering soft-metal tube, and confining it permanently in position by compressing the tube immediately behind the pipe, substantially as described.

138,780.—*Compound for Lining Bottoms of Bessemer or Kelly Converters.*—JAMES E. ATWOOD, Pittsburg, Pa. Application filed May 5, 1873.

Claim.—1. A compound consisting of plumbago in the form of old crucibles, German clay, ground fire-brick, Mount Savage stone-clay, and burnt or unburnt sand, substantially as described, for lining the bottoms of converters.

2. A compound consisting of carbon in the form of anthracite or bituminous coal, ground fire-brick, burnt or unburnt sand, and one or more of the plastic clays, substantially as described, for the lining of converters.

138,781.—*Compound for Tuyeres.*—JAMES E. ATWOOD, Pittsburg, Pa. Application filed May 5, 1873.

Claim.—1. A compound consisting of old crucibles, fire-brick, German clay, and burnt or unburnt sand, for forming converter-tuyeres, as set forth.

2. A compound consisting of plumbago, fire-brick, German clay, sand, burnt or unburnt, and Mount Savage stone-clay, as set forth, for forming the tuyeres of Bessemer or other converters.

138,782.—*Safety-Hook for Filing Papers.*—LUTHER H. BECKWITH, Port Jervis, N. Y. Application filed October 6, 1872.

A retaining-spring bears against the end of the hook and is moved back by a loop attached to a rock-shaft actuated by a lever.

Claim.—1. The improved safety-hook, consisting of the combination of the plate A; the hook B, and the safety-spring, the latter composed of the bow C and the coils *a a*, all arranged and operating substantially as and for the purposes herein specified.

2. The combination, with the plate A, spring C, and hook B, of the lever D *c*, substantially as and for the purpose herein specified.

138,783.—*Machine for Assorting Nails.*—BENJAMIN BEVELANDER, Boston, Mass. Application filed May 31, 1873.

The nails are thrown into a hopper, in the bottom of which reciprocates vertically a carrier for raising a single nail at a time up against the arms of a magnet, which latter turns on a pivot and carries the nail to the side of the machine, where a stripper takes the nail off the magnet.

Claim.—1. In machinery for assorting nails, tacks, &c., I claim the combination, with the nail-hopper or receptacle, of a vertically-reciprocating carrier, sliding within an orifice in the bottom of the hopper, and a rocking or vibratory magnet arranged to move towards and away from the carrier, said parts being arranged for joint operation, substantially as herein shown and described.

2. In combination with said hopper, reciprocating carrier and vibratory magnet, arranged and operating as specified in the preceding clause, I claim the vibratory stripper, arranged and operating to remove the nail from the magnet after said nail has been lifted by the latter out of the hopper, substantially as herein shown and described.

138,784.—*Wood-Screw.*—WILLIAM BOURN, Geneva, N. Y. Application filed August 1, 1872.

The screw has a brad-awl point, distinguishable from the brad-awl points of other screws by having a rounded edge instead of a straight edge.

Claim.—As an improved article of manufacture, a wood-screw provided with a flattened point having a circular cutting-edge, as and for the purposes set forth.

138,785.—*Clothes-Line Reel.*—JOHN BRIZEE, Alvarado, Cal. Application filed March 28, 1873.

A clothes-line reel with an upright outer case, having a weight suspended within it from a cord attached to the reel and to the weight, by a pulley and the top of the case, which passes over a smaller pulley near its top, and down to the shaft of, and the other end out and over, a pulley on the case, with a ring for its connection to a detent or holder for use, and with a detent to hold it attached to the reel by a pawl and ratchet.

Claim.—A clothes-line reel, consisting of the upright box A, with its extension C having the shaft *d*, with its pulley E, the ratchet-wheel *r*, pawl *s*, hook *t*, clothes-line *f*, weight-cord K, and weight O, all constructed and arranged as shown, and for the purpose above described.

138,786.—*Clover-Harvester.*—DAVID R. BRUTON, Concord, N. C. Application filed October 7, 1872.

The box which supports the gathering devices and receives the cut crop is adjustably suspended between horizontal bars supported on the axles of the carrying-wheels.

Claim.—The combination, with the axles K K', of the longitudinal rails J J and the adjustable box A with perforations *x x* and interior clover-gathering mechanism, all constructed and operated substantially as set forth.

138,787.—*Paint-Brush.*—GEORGE H. CHINNOCK, Brooklyn, assignor to JOHN H. HAPGOOD, New York, N. Y. Application filed October 19, 1872.

The head of the brush is formed by compressing the bristles into the band or ferrule of wire about half of its width, the upper ends of the bristles being saturated with melted resin, when pegs are driven into the top or inner end of the mass of bristles of a sufficient number to tighten them securely, after which the block and handle are attached to the band or ferrule.

Claim.—The combination of the system of isolated pegs, made and applied separate and distinct from the handle-butt, with the

bristles and top or holding-band, whereby provision is made for the efficient tightening of the bristles to any requisite degree previous to the attachment of the handle, substantially as herein set forth.

138,788.—*Means for Operating Earth-Augers.*—JOHN B. CHRISTIAN, Hamburg, Iowa. Application filed November 14, 1872.

The rods B B are pivoted at their lower ends to the base-frame, and at their upper ends support the socket C, through which the boring-shaft works. The rods and socket are held in proper position for boring brace-hook E. When the auger is to be withdrawn the sections D and D' of the boring-shaft are uncoupled, the hook E unfastened, and section D of the shaft swung over and coupled with the shaft of the windlass M, which is then rotated and raises the auger by means of the chain attached.

Claim.—1. The combination, with the frame A, of the pivoted rods B B, socket C, fenders G G, with studs *a a*, hooked brace E, and shafts D' D', all substantially as set forth.

2. The pivoted or hinged rods B B and shaft D, in combination with the windlass-wheel M, when used as and for the purpose specified.

3. The hinged or pivoted cross-bar N, when used with the frame A, as and for the purpose set forth.

138,789.—*Machine for Pointing the Journals of Bobbins.*—DWIGHT M. CHURCH, Holyoke, Mass., assignor to TIMOTHY MERRICK, same place. Application filed May 17, 1872.

Bobbins for use upon sewing-machines are carried forward and held in position by a carrier-wheel, while two rotating reciprocating cutters are advanced to point them.

Claim.—1. In a machine for pointing or finishing the journals of sewing-machine shuttle-bobbins, the cutter-heads provided with the removable circular thimble or face-plate 25, adapted to be inserted in the cutter-head, and to receive the heads or journals of the bobbins, as shown and described.

2. The thimble 25 constructed with a flange, 25*, or its equivalent, serving to lodge it concentrically in the cutter-head, a concentric cavity, 28, serving to receive and guide the head of the bobbin, and a smaller central and concentric opening, 29, serving to receive and guide the journal to be finished.

3. The combination, with the two continuously-revolving but intermittently-sliding shafts carrying cutters for journaling or pointing both ends of small bobbins, of an intermittently-rotating bobbin-feeding wheel, adapted to receive and carry the bobbins fed in at its periphery, substantially as shown and described.

4. The combination, with mechanism for simultaneously pointing or journaling both ends of the bobbin, of an intermittently-rotating feed-wheel provided with adjustable bearings, the combination being substantially as and for the purpose described.

5. The combination of two cutter-heads, each mounted on a separate and adjustable shaft in the same axial line, with the separately-adjustable side guides 5 5 for guiding and positioning both ends of the bobbin in its passage to the cutters.

6. The combination, with the described feed-wheel having the peripheral notches to receive the bobbin-barrels and the peripheral flanged groove, of the strap for holding the bobbins to place upon the wheel, as set forth.

7. In combination with the feed-wheel and holding-strap, the intermittently-acting lever for pressing positively upon each bobbin successively while its journal is being pointed or journaled.

8. The combination of the adjustable and inclined feed-guides 4 4 with the intermittently-acting feed-wheel and its holding-strap, substantially as shown and described.

9. The combination of a bobbin-feeding guide, 4, a bobbin-feeding-wheel, H, and mechanism, substantially as described, for finishing or pointing the journals of sewing-machine bobbins ready for use in the shuttle.

138,790.—*Plumb-Bob.*—GEORGE B. COWLES, Bridgeport, Conn. Application filed March 10, 1873.

A screw-cap on the top of the plumb is so formed as to leave a neck upon which the line is wound, and a slot in the cap allows the line, when of the desired length, to be brought to the axial or central point in the top, at which point it is held by the rotation of a slotted plate or washer.

Claim.—In a plumb-bob, the recess C, spindle B, slotted cap D, and locking-tip or equivalent *e*, substantially as described and set forth.

138,791.—*Sectional Steam-Generator.*—WELLSLY W. CRANE, Auburn, N. Y. Application filed April 12, 1873.

A hollow front wall having a steam-dome and a hollow flange running the entire length, vertically arranged, communicating with the water space. The smoke flue running through the hollow wall. The water-tubes screwing into the back of said wall and into sockets at the other end, with circulating-pipes connecting with each water-tube to the mud-drum, thus keeping up a circulation, all the steam passing through the front to the steam-dome.

Claim.—1. The front piece A, provided with an enlargement, D, at its top, and a hollow flange, *c*, on one side, which extends from top to bottom, substantially as and for the purposes herein set forth.

2. The combination of the screw-socket G and extension A, with the water-tube B, smoke-pipe C, and circulating-pipe I, screwed into the outer face of the extension A, substantially as and for the purposes herein set forth.

3. The combination of the front piece A, provided with female screw-threads, the water tube or tubes B with screw-threads on each end, the smoke pipe or pipes C with screw-threads on each end, the screw socket or sockets G having extensions A, circulating pipe or pipes I, and the mud-drum J, all constructed substantially as and for the purposes herein set forth.

138,792.—*Sectional Steam-Generator.*—WELLSLY W. CRANE, Auburn, N. Y. Application filed April 12, 1873.

A reversible fire-brick-lined back and top, having a damper. A coil of water-pipe is arranged around the water-flues, said flues being connected by tubes at their ends leading to a mud-drum. The coil is connected to the hollow walls, said walls connected by pipes, top and bottom, the whole provided with a bottom inclined toward its center to form a sediment-collector.

Claim.—1. The combination of the removable fire-brick-lined back wall E with the fire-box of a steam-generator, substantially as and for the purposes herein set forth.

2. The removable fire-brick lined top H, provided with a damper, I, in combination with the fire-box of a steam-generator, substantially as and for the purposes herein set forth.

3. The combination of the coil-pipes *d d*, with the walls of the fire-box, as and for the purposes set forth.

4. The combination of the hollow walls A G bolted together and connected at top and bottom by the pipes *b b*, substantially as and for the purposes herein set forth.

5. The inclined fire-box bottom M in combination with the hollow water bridge-wall D, as and for the purposes set forth.

138,793.—*Device for Applying Steam-Power to Street-Railway Cars.*—WELLSLY W. CRANE, Auburn, N. Y. Application filed April 12, 1873.

Two engines are placed upon the front platform, their pistons being connected to a double crank-shaft which is secured to suitable bearings underneath the platform. The front and rear axles connect by means of belting with the crank-shaft. Upon the rear platform is placed a water-tank, and underneath the rear platform a condenser, into which the exhaust steam is conveyed by pipes from the engines. In connection with the condenser is an air and a force pump, both operated by rods from an eccentric on the rear axle.

Claim.—1. The combination, with a street-car, A, of an engine and a rectangular boiler, D E, upon one end of the car, the elevated tank J placed upon the other end of the car, and the pipe *m'* under the bottom of the car, substantially as and for the purposes herein set forth.

2. The combination, with a street car, of the axles B, loosely-fitting wheels C, ratchets *a*, collars *d*, and pawls *b*, all constructed and operating substantially as and for the purposes specified.

3. The combination of the axles B B', loosely-fitting wheels C C, ratchets *a*, collars *d*, pawls *b*, chains A A', pulleys G G', crank-shaft *e*, pulley *f*, and engine D, with a street-car, A, all constructed and operating substantially as and for the purposes herein set forth.

4. The combination of the tank J, condenser H, air-pump I, force-pump I', connecting-rods K K', eccentrics *n n*, and the axle B' of a street-car, A, all substantially as and for the purposes herein set forth.

138,794.—*Car-Axle Box.*—WELLSLY W. CRANE, Auburn, N. Y. Application filed April 12, 1873.

The box is provided with a rear extension, into which is arranged a divided packing-case, the same being held in place by means of bolts and spiral springs. Oil is supplied to the journal by means of a roller, which rotates beneath the journal and is inclosed by a shield, the sides of which are so shaped as to confine the oil to the journal.

Claim.—1. In combination with a box, A, provided with an extension, H, the removable packing-box I made in two parts, connected by the bolts *p p*, and covered by the plate J, all substantially as and for the purposes herein set forth.

2. The combination of the plate *k* with its inclined semicircular lip *m* and pointed ends *i i*, with the removable box I, substantially as and for the purposes herein set forth.

3. The shield G inclosing the roller D extended above the top of the same and around the lower portion of the axle, and having exterior vertical flanges *d d*, inclined flange A, and spring-feet *b b*, substantially as and for the purposes herein set forth.

138,795.—*Carriage-Axle Iron.*—S. JAMES DENNIS, Boston, Mass. Application filed March 1, 1873.

Claim.—The new article of manufacture described, to wit, axle-iron rolled with two of its corners alternately round and square, as described.

138,796.—*Stool for Dental Chairs.*—THOMAS BENTON DOWNS and WILLIAM DAWSON MORRIS, Jefferson City, Mo. Application filed July 22, 1872.

A revolving seat that works by an elevating-screw in a bracket which has two arms. Each arm plays in a ball that is attached to a sliding carriage that moves back and forth on slides secured horizontally to the chair.

Claim.—The seat E, bracket D with arms *c c* and A, in combination with the balls *c c*, slides A A, carriages B B, and set-screws G G, the several parts being constructed and arranged substantially as and for the purpose described.

138,797.—*Fly-Trap.*—GEORGE W. ERNST and ISAIAH LUCAS, Fremont, Ohio. Application filed April 17, 1873.

The trap is constructed with a woven-wire cover and a closely-fitted wire basket with openings for the flies to pass up, which rests upon another inverted to cover the receptacles for food upon the bottom or foundation. The cover and bottom are held together by springs. On the top of the cover is a closely-fitted flanged cap.

Claim.—1. The movable basket C, constructed as herein described, used in combination with the box D and movable cover E, the basket and box being made of gauze-wire, as and for the purposes set forth.

2. The combination of the bottom A with cups *a a*, wire-gauze cover B, removable wire basket C, wire box D, and movable top E, all the parts being constructed substantially as and for the purposes set forth.

138,798.—*Car-Wheel.*—FRANK A. FOUTS, Bloomington, Ill. Application filed April 21, 1873.

The wheel has an outside supplementary tread, which has an outer flange. The supplementary wheel suports the truck should the main wheels jump the track.

Claim.—A car-wheel having the flange *d*, tread *c*, and the supplementary tread *b* having the outer flange *a*, substantially as set forth.

138,799.—*Carriage-Curtain Fastening.*—JOHN H. GLEASON, Troy, N. Y. Application filed October 8, 1872.

Designed to avoid boring holes in the top props, and to be adjusted to correspond with portions of curtain button-holes.

Claim.—A carriage-curtain fastener having the hinged, jointed, or flexible clasp with the two-part screw-threaded shank on the end portions of the clasp, and the removable button-knob screwed upon the said two-part shank, substantially as herein described.

138,800.—*Butter-Paddle.*—DEMAS L. GROVER, Groton, N. Y. Application filed April 3, 1873.

A butter-paddle having a thermometer so inserted in the lower part of the handle as to have its front and back exposed to the direct contact with the liquid.

Claim.—A paddle for stirring milk, cream, or curd, provided with a thermometer, as and for the purposes set forth.

138,801.—*Stock-Feeder.*—CYRUS M. HALL, Yates City, Ill. Application filed March 10, 1873.

The inclined sides of the crib are provided with hinged sections which are acted upon automatically by the nose of the animal to shake down the feed. A sliding waste-trough beneath has a central division-board extending nearly to the bottom, the space permitting the frame to cover the whole trough.

Claim.—1. The hinged slats or boards E forming part of the inclined slides C of the grain-crib, for the purposes herein set forth.

2. The sliding trough I with central divider-board J, constructed as described, in combination with the openings and slides G in the troughs B, substantially as and for the purposes herein set forth.

138,802.—*Washing-Machine.*—JOHN D. HARTZELL, Ozawkie, Kans. Application filed March 31, 1873.

A washing-machine constructed with its rubber attached to an upright, (hinged or pivoted on top of the tub,) and motion given by adjustable levers pivoted at or near its top. The rubber is constructed with corrugated rollers on each side and at its center, with plain rolls between them, and held in contact with the bottom by rubber springs on its journals, and the frame is provided at its ends with drip-boards.

Claim.—1. The standard provided with rollers alternately corrugated and smooth, in combination with the corrugated frame, substantially as shown and described.

2. The combination of the frame *a* provided with drip-boards *d*, blocks *g t*, cross-bar A, levers *i i*, rollers *m n*, and the rubber band or its equivalent, when all are combined and arranged as set forth.

138,803.—*Clothes-Wringer.*—CORNELIUS E. HAYNES, Boston, Mass., assignor to himself and WILLIAM H. HENDERSON, same place. Application filed March 23, 1873.

The invention consists in the attachment, to a furcated clasp or holder, of a spring in S-form with its ends formed to receive the journals of the rolls. In the curved part of the clasp is an opening, through which a lever is passed, with a curved end and notches to fit the variation in the thickness of the tub and for its support.

Claim.—1. In a clothes-wringer, the roller carrying springs B, formed substantially as shown, and provided with bends A for receiving the journals of the rolls, substantially as and for the purposes described.

2. In combination with the furcated block A formed with a slot, *c*, in one of its legs, the latch or clamp C provided with one or more notches, *f*, and arranged to operate substantially as shown and set forth.

138,804.—*Balanced Valve for Steam-Engines.*—ALEXANDER HENRY, Richmond, Ind. Application filed February 12, 1873.

A hollow balancing-plate with a central vent is combined with hollow columns, made adjustable, which form additional steam-ports, and assist in balancing the valve which fits snugly between the balancing-plate and the valve-seat. The central vent-pipe passes through a stuffing-box in the back of the steam-chest cover.

Claim.—1. A slide-valve and balancing-plate, in combination with the hollow columns F, when said columns are so constructed and arranged as to admit of the adjustment of the balancing-plate upon the top of the valve and upon the columns, substantially as described.

2. The balancing-plate D, as shown and described, said plate having the openings V connecting with the columns F and the stem I attached to the top of said balancing-plate, in combination with the stuffing-box K, all arranged and operating substantially as described.

138,805.—*Lantern.*—GEORGE B. ISHAM, Burlington, Vt. Application filed March 27, 1873.

The ball is connected with the lamp, and has "keepers," into which a rod, passing through the chimney-cap, fits.

Claim.—The combination of the base or fountain A with ball or handle E attached to the same and provided with keepers *b b*, the burner B, holder C, chimney D, and cap G on the sliding rod or bar *a*, all substantially as and for the purposes herein set forth.

138,806.—*Combined Harrow and Seeder.*—LOREN G. JACKSON, Marion, assignor of one-half his right to CHARLES WOOD and ALBERT ELLIS, Woodman, Wis. Application filed March 31, 1873.

A harrow made in three parts, of V shape form, and pivoted between two driving-wheels. The center-beam of each harrow is pivoted in front to hangers suspended from a transverse rod. The rear parts are adjustably secured to beams, which beams are fastened to hangers situated about midway between the front and rear of the frame. The frames are each adjustable, separately or together, by suitable chains and levers.

Claim.—1. The harrows C C C, connected, by the arms *a a* and D D, to the frame A, substantially as herein set forth.

2. The combination, with the harrows C C C and arms *a a* and D D, of the chains *d d*, lever E, cords *e e*, levers G G, and foot-board G', all arranged as described, whereby all the harrows may be raised simultaneously or each one separately independent of the others, as herein set forth.

138,807.—*Wagon-Standard.*—JAMES H. KNISLEY and JOSEPH C. FERGUSON, Rainsborough, Ohio. Application filed March 27, 1873.

The standard is secured to a plate, which is hinged to the bolster so the standard may be secured horizontally, if desired.

Claim.—The combination of the bolster A, hinged plate B, standard F, and hasp I, substantially as and for the purpose specified.

138,808.—*Scroll-Sawing Machine.*—HUMPHREY LAWRENCE, Fredericton, Canada. Application filed March 25, 1873.

The saw is attached to one end of the arms of a vibrating frame, a straining-rod passing through the opposite ends to maintain the necessary tension.

Claim.—The combination of an adjustable spring-catch, H, thimbles A, rods T, forked holder *f*, saw-frame F, and plate E, the whole constructed and arranged to operate substantially as and for the purpose set forth.

138,809.—*Resin Box and Cooler.*—ARCHIBALD K. LEE, Galveston, Tex. Application filed May 3, 1873.

Box or receptacle for resin, oils, molasses, &c., which is so constructed and arranged as to permit of the liquid being surrounded by either steam or water, and also permits the desired degree of temperature being maintained to insure of the material being kept at such a state of liquidization as to permit of its being readily drawn off into barrels.

Claim.—1. The resin, oil, or molasses box A, having a steam-chamber, B, nozzles C C', and cocks *c c'*, the whole being constructed, combined, and arranged to operate substantially as described, as and for the purpose specified.

2. The box A, having a steam-chamber, B, and the series of faucets D D, the whole being constructed, combined, and arranged so as to operate substantially as described.

138,810.—*Apparatus for Steaming and Cleaning Barrels, &c.*—ARCHIBALD K. LEE, Galveston, Tex. Application filed May 5, 1873.

Constructing a vessel with a jacket or outer casing so arranged as to leave a steam-chamber, and which is provided with inlet and discharge tubes, arranged respectively at the upper and lower sections thereof, and which chamber furnishes a means of heating the vessel to such a degree as to soften the gummy material which adheres to the barrel, and which permits of the same being more readily removed by jets of steam emitted through the perforations of the rose, and which acts directly on the interior of the barrel.

Claim.—1. The vessel A having a steam-chamber, B, pipe D, tubes D' D', and roses *d d*, the whole being combined and arranged to operate substantially as described.

2. A vessel having steam-pipes D and E E arranged to heat the same, and at the same time serve as a supporting-frame for the barrels, in combination with the tubes D' D' and roses *d d*, the whole being constructed and arranged to operate substantially as described.

3. The vessel A having a steam-chamber, B, formed as shown, pipes D and E E, tubes D' D', and roses *d d*, the whole being combined and arranged to operate substantially as described.

4. In combination with a barrel-steamer, the frame H, constructed and arranged so as to operate in connection therewith, substantially as described.

138,811.—*Hoisting-Whim.*—JOSEPH C. MARSHALL, San Francisco, Cal. Application filed March 26, 1873.

Connecting or disconnecting the horse power and the hoisting-drum by means of the cross-bar, connected with a lever and ratchet mechanism.

Claim.—In combination with the drum D, with its lugs I, and the axle E with the cross-bar H and rod G, the lever J, cord or chain K, and hand-lever M with its holding-rack, substantially as and for the purpose herein described.

138,812.—*Lamp.*—CHARLES MAYER, Baltimore, Md. Application filed April 9, 1873.

A tube carrying a spring-valve slides over the wick-tube, and is operated by a jointed rod bearing a weight, which is moved upon the inner surface of the lamp-fount. In case the lamp is inclined, the tube is raised and the valve closes the end thereof, thus extinguishing the light.

Claim.—The slide C, carrying the spring-extinguisher *b d*, and connected by a jointed rod, *a*, with the weight D, which is suspended within the oil reservoir E, to operate the extinguisher by contact with the inner side of the reservoir, substantially as specified.

138,813.—*Fire-Proof Roofing.*—CHARLES PARKER, Wenona, Ill. Application filed March 3, 1873.

The composition consists of wood, coal or peat-ashes, salt, powdered clay, and powdered alum, or alum in solution, and it is laid upon the sheathing-boards, its side edges extending into the grooves in the wall, and the outer sheeting is then laid over it.

Claim.—1. The roofing-composition, when composed of the ingredients and compounded in the manner specified, and laid upon a foundation of wood sheathing or other known rafter-sheathing, and covered with tin or iron sheeting, tiles, or slating, or other known final weather-covering, substantially as described.

2. The combination of the roofing or its edge with the recesses *a* in the walls or parapets, to prevent the passage of fire downward into the house, as described.

3. The combination of the ingredients named, with or without water to incorporate them, to form a roof, and for other purposes, substantially as described.

138,814.—*Machine for Making Laminated Pipe for Gas, Water, &c.*—JOHN S. PATRIC, Rochester, N. Y. Application filed January 13, 1873.

Surrounding the core is a segmental jacket, internally ribbed, each segment having a presser-spring, under which the splints pass when fed to the core through openings in the jacket. The hollow shaft at the discharge end of the machine is provided with a clamping-head, which slides freely on the shaft and is made to revolve with it by means of spline, thus supporting the free end of the pipe while permitting its discharge from the core. Cold water circulates through the discharge-shaft, while the core is heated by steam.

Claim.—1. In a machine for making pipe formed of several layers of splints wound spirally, the revolving core, in combination with a fixed or stationary jacket, or vice versa, for the purposes set forth.

2. In laminated-pipe winding-machines, either a revolving or a fixed forming-core, constructed to discharge continuously the built-up pipe, and be heated by steam or other suitable means, as described.

3. In combination with the hollow heating and forming core C, or its equivalent, the hollow shaft J for ejecting cold water into the built-up pipe, for the purpose of hastening the cooling of the same as fast as it is forced off from the end of the core.

4. The devices, constructed and arranged to operate substantially as shown and described, for sustaining the outer end of the laminated pipe while it is being formed.

5. The rotary clamping and supporting head H, or its equivalent, in combination with the core C and governing-jacket F, whether either or both are fixed or rotary, for the purposes set forth.

6. The adjustable presser or layer spring *i*, in combination with the core C, constructed and arranged to operate substantially in the manner and for the purposes shown and described.

138,815.—*Lock-Cutting Machine.*—ISAAC L. PENNEY, Minneapolis, Minn. Application filed April 3, 1873.

A curved knife is attached to a vibrating bar, and so arranged as to be raised by a spring, but is forced down through the loop by the foot of the operator applied to a treadle or other similar device.

Claim.—The combination of the metallic frame B with the angular knife C with cutting-edge, as shown at *x x*, secured upon one end of the frame, and the inclined knife E attached to a bifurcated arm, D, hinged to a shaft at the other end of the frame, around which is coiled a spring, *d*, with one end projecting under the arm, all constructed and arranged substantially as and for the purposes herein set forth.

138,816.—*Bolster-Plate for Wagons.*—TOM PICKARD and JOSEPH PICKARD, Minonk, Ill.; said TOM PICKARD assignor to said JOSEPH PICKARD. Application filed January 10, 1873.

A device to be attached to the bottom of the wagon-box for holding the same to its place on the bolster and keep the bottom and sides of the box from wearing against the bolster and stake.

Claim.—The plate C, adapted to be fastened to the bottom of the wagon-box, and provided with the flange D, to extend up along the side of the box, and with flanges E E to fit over the bolster, substantially as and for the purposes herein set forth.

138,817.—*Metallic Column.*—JOHN L. PITER, Pittsburg, Pa. Application filed April 11, 1873.

Claim.—1. As a component part of a hollow post, column, strut, or girder, a plate, B, rolled to a curved form, and with lugs a rolled on each edge of the outer face, such lugs being broader on their outer face than at their bases, whereby, when two or more such plates are brought edge to edge, with or without distance pieces *p'*, the two contiguous lugs will form the male part of a dovetail-joint, substantially as set forth.

2. The hollow post, column, strut, or girder composed of three or more plates B, secured together by means of any known suitable device, arranged on the dovetail-shaped ribs *a*, substantially as set forth.

138,818.—*Hand Corn-Planter.*—JOHN PRESTON, Plymouth, Ohio. Application filed August 23, 1872.

The plow-beam is made of iron, and is so curved that if the lower end of the beam were continued without a change of curve it would cross the forward end at about the position of the clevis. The share is mounted upon a sole in such manner as to leave a space between its upper end and the beam. A rudder or guide-plate is attached below the share.

Claim.—The beam *a*, when curved as described, in combination with the sole *f g*, guide-plate *h*, and shovel *b*, all arranged as specified.

138,819.—*Sofa-Bedstead.*—CHARLES ROSSOW, Chicago, Ill. Application filed January 31, 1873.

When the folding portion is closed the pillow for that portion is concealed under the stationary pillow, but when said hinged portion is opened, the pillow is connected to the same by pins and a jointed brace, and to the stationary pillow by a hook.

Claim.—In combination with the stationary head *m* and hinged part T, the detachable pillow B, the jointed brace *a a*, the pins *w w*, and hook C, arranged in the manner and for the purpose set forth.

138,820.—*Cork for Bottles.*—IRA B. SAMPSON, Albany, N. Y. Application filed April 16, 1873.

The cork for about one-third of its length is made cylindrical, and the remaining two-thirds in the form of a truncated cone. By this construction a saving in material is effected. The fastenings for securing the cork converge more directly to the center of the cork, and leakage is prevented by the shoulder formed at the mouth of the bottle.

Claim.—As an improved article of manufacture, a cork combining together the forms of the cylinder and truncated cone, as and for the purposes specified.

138,821.—*Preparing Sawdust for Use in the Arts.*—FREDERIC H. SNYDER, Jersey City, N. J., assignor to THOMAS HYSLOP, New York, N. Y. Application filed February 14, 1873.

Claim.—As an article of trade, a block or bale of compressed sawdust incased in a wrapper of burlaps or other suitable material.

138,822.—*Pipe or Car Coupling.*—ABA G. STORY, Waterloo, N. Y. Application filed February 28, 1873.

Two cylindrical tubes, the ends of which are closed by means of screw-caps. Through the caps pass small steam-pipes having collars on their ends for preventing them from being drawn out of the tubes and the coupling-boxes. The pipes are for conducting steam from one tube to the other between the cars; they also carry steam to the heaters in the cars. The end of one of the pipes passes through a sleeved coupling-box, and the end of the opposite pipe passes through the head of a slide coupling box, on which is applied a hand-wheel. It is by means of the boxes that cars are coupled and uncoupled.

Claim.—The coupling D *g*, combined with steam-pipes C' C', packing-tubes A A, and steam-pipes C C, the same constituting a tubular, flexible, and telescoping car-coupling, substantially as described.

138,823.—*Rotary Sieves.*—THOMAS C. STRAWN and WILLIAM C. DRUM, Perry township, Fayette county, assignors to SPEER, CLARKE & CO., Pittsburg, Pa. Application filed March 1, 1873.

The material to be sifted is passed into the interior of the rotating sieve by means of a spout. Buckets are arranged at intervals on the internal periphery of the wheel, which carry the coarser particles to the upper side of the sieve and empty their contents into a trough, which carries them off. A jet of steam is directed into the meshes of the sieve to clean them.

Claim.—1. The buckets *f* arranged in the periphery of the wheel *a*, in combination with the discharge-spout *g*, substantially as and for the purposes set forth.

2. The wheel *a* supplied with buckets *f*, in combination with the supply-spout A and the discharge-spout *g*, substantially as described, and for the purposes set forth.

3. The steam-pipe *m*, in combination with the sieve a^1, for supplying a jet of steam for cleaning the same, substantially as described.

138,824.—*Machine for Preparing Pottery-Stock.*—SAMUEL R. THOMPSON, Portsmouth, N. H. Application filed February 8, 1873.

A machine so constructed that clay, pottery-stock, &c., after being deposited in a cylinder, is forced by a plunger through a screen, up and out of the mouth of a tube upon an endless feed-roller, and cut off in required size.

Claim.—1. A machine for screening, rolling, and otherwise preparing pottery-stock and relieving the same of air-bubbles or blisters, provided with a plunger, *p*, having an up-and-down movement within a receiving-cylinder, *f*, by which the clay or stock is pressed through a screen or perforated disk, *k'*, formed on or connected with the bottom of a curved tapering tube, *k*, up through and out of the said tube upon an endless feed-roll, *p''*, where the stock is cut in the exact size required for use by the operation of cutters adjusted to the desired width and raised above or lowered upon the said stock or clay, substantially as hereinabove specified.

2. In machines for preparing pottery-stock, a curved tube, *k*, tapering within toward its mouth, and arranged to turn back and forth horizontally on the top of a receiving-cylinder, *f*, substantially as and for the purposes described.

3. The combination of the screw-stem *w*, wheel *x*, or their mechanical equivalents, and their supporting-frame, plunger *p*, receiving-cylinder *f*, adjustable tapering tube *k* screen *k''*, feed-roll or chain *p''*, and adjustable cutters or wires *u*, all arranged and operating substantially as and for the purposes herein set forth.

138,825.—*Machine for Milling Pipe-Tips.*—ALBERT RICHARD WEISS, Brooklyn, E. D., N. Y. Application filed August 1, 1872.

Claim.—The eccentric cog-wheel E mounted on a spindle, C, which slides in a swinging head, B, in combination with a pinion

mounted on a fixed stud, and with a spindle, K, carrying a milling-tool, the whole constructed and operating substantially in the manner herein shown and described.

138,826.—*Attachable Rockers for Chairs.*—PATRICK J. WELSH and JOHN H. WELSH, Philadelphia, Pa. Application filed April 23, 1873.

One end of the rocker has a circular hole to receive the hind leg, and the other end an oblong hole to receive the front leg. The oblong hole has a clamping-piece, which is forced upon the outer side of the leg by means of a screw passing out at the end of the rocker, and provided with a head to operate it.

Claim.—A rocker, A, provided with holes *a b*, opening *c*, clamping-piece C, screw D, and revolving nut E, substantially in the manner and for the purpose set forth.

138,827.—*Valve Device for Steam and Air Brakes.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Application filed February 1, 1873.

A triple valve, with a diaphragm at its upper end and coiled springs around the stem, is arranged in the brake-pipes for steam and air brakes, so that, by a continuous pressure of air in the pipes, communication is kept open to the reservoir and closed to the brake cylinder, but kept open from this to the atmosphere; also, by lowering the pressure from the pipe, communication is opened from the reservoir to the brake-cylinders, and all other communications closed.

Claim.—1. A piston, *m*, in combination with a flexible annulus, *m'*, and arranged in the communicating-chamber or air-brake apparatus, and operative in admitting air and opening and closing an escape-valve, *b*, substantially as set forth.

2. The combination of the valve-opening constituting the communication from the reservoir to the brake-cylinder, when such opening varies in area with the greater or less movement of the valve, with the valve operated by the difference in pressure on two sides of a piston, substantially as set forth.

3. In combination with a triple valve, a spring, *g*, or equivalent weight, suitably arranged, so as to keep the lowest valve *c* clear of its seat under an equilibrium of air or other fluid pressure in the upper valve-box, substantially as set forth.

138,828.—*Rotary Valve for Steam-Engines.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Application filed February 15, 1873.

A rotary balanced valve is operated and reversed by a stem having a shoulder and passing through a bush in the side, and is connected, by a slot-shaped eye at its upper end, to a pin on the rotary valve. The rotary valve is conical in form, and rotates on a central stem having a collar with bearing on the smaller end, the opposite end passing through a stuffing-box.

Claim.—1. The conical valve *n* subject to steam pressure at its larger end, in combination with the stem *g*, on which it rotates, and the collar *e* on said stem with a bearing against the smaller end of the valve, the opposite end of the stem *g* passing through a stuffing-nut so as to have a free end play, substantially as set forth.

2. The stem *f* having a shoulder, f^1, and a reduced part, r^1, above, in combination with a bush, *r*, suitably seated or held in a fixed position, substantially as and for the purposes set forth.

3. The stem *f* connected by a slot-shaped eye at its upper end to a pin, i^1, in combination with the rotary valve *n*, substantially as set forth.

138,829.—*Measuring-Wheel for Wagon-Tires.*—TRUMAN WHITING, Niles, Mich. Application filed October 21, 1871.

The measuring-wheel is provided with a spring-pencil or marker in the prolongation of the handle for marking the starting-point on the wheel to be measured, as well as with an adjustable index for showing the terminal distance on the circular scale.

Claim.—In a device for measuring tires, the combination of the wheel A, having the scale of inches and fractional parts of an inch on one or both sides, with the handle B, having the sheath D containing a pencil and spring, as described, the sleeve E, and the movable index C, all as and for the purposes hereinbefore set forth.

138,830.—*Harvesters.*—JOHN D. WILBER, Ponghkeepsie, N. Y. Application filed May 3, 1872.

The driving-wheel rotates on a hollow axle, which is an extension of the main frame. Said wheel is made hollow to contain the driving-gearing. The reel-arms rotate around their axis, and are provided with teeth so that they may be used as rakes or beaters.

Claim.—1. The combination of endwise-movable pinion and shaft b^3 *b* with the hollow axle B, hollow drive-wheel A, and frame B^1, substantially as described.

2. The shoe D adjustably connected by its front upturned end to the tongue C and connected by its rear end to the finger-bar F, in combination with the hinge *j*, which connects this shoe D to the arched extensions B^9 B^3 of the axle-frame B^1, substantially as described.

3. The arms I applied to short hinged shafts *z*, so as to rotate about their long axes, in combination with notched spur-wheels *k* and spring-bolts g^4, and with a movable segment, g^2, and rail g^3, substantially as described.

4. The arms I rotating entirely around their own axis, in combination with the continuously-revolving combined rake and reel-head, substantially as set forth.

5. The anti-friction wheel *t*, as a support for each arm I upon its cam-way E, in combination with the spur-wheel A and a locking and unlocking device therefor, substantially as described.

6. The platform G hinged to the finger-bar at its inner and outer ends, and having its downward movement limited by stop 3, substantially as described.

7. The rake and reel arm I, constructed with long raking-teeth on one side and shorter reel-teeth on the opposite side, substantially as described.

8. The rake and reel arm forked at its outer end, substantially as and for the purpose described.

138,831.—*Lamp-Bracket for Sewing-Machines.*—LUDWIG M. N. WOLF, Avon, Conn. Application filed April 17, 1873.

To the corners of a sewing-machine is attached a holder, to which is pivoted jointed connecting-links. Between the two is attached, by pivots, an open link or holder for the lamp, which, by the pivoted device, may be moved and held for the convenience of the operator.

Claim.—The links *b*, socket *c*, with the table *a*, substantially as and for the purpose set forth.

138,832.—*Marine Safes.*—GEORGE F. ABRAHAM, Baltimore, Md., assignor to himself and DANIEL CLARIDGE. Application filed March 12, 1873.

Claim.—A marine safe or life-buoy, formed of metallic sheets D C, spaced with cork or other light material to render it buoyant, in combination with the copper or other non-corrosive sheet B, backed with rubber or other elastic substance, and provided with apartments for the reception of valuables, substantially as and for the purpose described.

138,833.—*Lid for Jelly-Glasses.*—JOHN ADAMS, Pittsburg, Pa. Application filed April 16, 1873.

A portion of the surface of a jelly-glass cup is made semi-opaque, so that the name of the jelly, which is printed on paper and inserted in the top of the cup, will be shown through the plain surface only.

Claim.—A slip-top lid for jelly-glasses provided with a semi-opaque surface, *e*, and a plain surface, *f*, and paper disk having the names of jellies printed thereon, substantially as herein described and for the purpose set forth.

138,834.—*Railroad Switch.*—JOHN R. ADAMS, Sacramento, Cal. Application filed March 15, 1873.

The inverted rail beneath the bed-plate is designed to obviate the effects of temperature expansion and contraction upon the operation of the switch. It ties the rail *a* to the plate D, so that the switch-rail may always clear the ends of rails C, while never leaving so great a gap as to admit of the hammering of the ends of the rails.

Claim.—1. The connection of switch-rail A, pivoted at end *a*, with inverted rail B, laid into the cross-ties and separated by lateral bed plates *b*, substantially as set forth.

2. The combination of inverted rail B with connecting bed-plate D and track-rails C, for the purpose of producing equal expansion and contraction, substantially as described.

138,835.—*Railroad Frogs.*—WILLIAM B. ATKINSON, Philadelphia, Pa. Application filed January 8, 1873.

Claim.—A compound frog, consisting of rails A A' B B', in combination with filling-pieces D D' extending the entire length of the frog and flush with the bottoms of the rails, all being permanently bolted together in their relative positions, as set forth.

138,836.—*Railway Snow-Plow.*—JAMES W. ARNOLD, Boston, Mass. Application filed February 27, 1873.

Upon the periphery of a revolving cylinder are arranged a series of blades extending from throats leading inward into tubes, these tubes having pistons that are driven inward and outward.

Claim.—1. In combination with a car-truck, the wheel *e* made with blades *f*, tubes *e*, and throats or openings *g*, substantially as described.

2. In combination with the tubes, the ejector-pistons *k*, substantially as described.

3. In combination with the wheel *e*, tubes *e*, and pistons *k*, the cam-wire for operating the pistons.

4. In combination with the wheel, tubes, and pistons, the steam or compressed-air tube *o*, substantially as described.

5. In combination with the tube, the pump *o* having a piston operated by an eccentric, *p*, on the shaft *q*, substantially as shown and described.

6. For driving the wheel *e*, the cranks a^2 *y*, connecting-rod *z*, shaft *q*, and the gears *v u t*, for connecting the shaft *q* with the truck-wheel axle.

7. The combination of the engine b^2, shaft d^2, gears c^3 f^2, and shaft g^2, for operating the truck-axle, substantially as described.

8. The construction of the wheel with a collapsible series of tube-supporting spokes and a flexible band, k^2, and the combination therewith of the movable half-rings l^2 m^2 for opening and closing the wheel, all substantially as described.

138,837.—*Breech-Loading Fire-Arm.*—JAMES ASTON, Hythe, England. Application filed September 6, 1872.

Combination of lever with breech-block and hammer, whereby the breech is operated and hammer cocked by a single movement.

Claim.—The claw-lever C, either with or without the stirrup D, when combined with the breech-block A and hammer B, as and for the purpose set forth.

138,838.—*Cultivator.*—DEWITT CLINTON BAKER, Fulton, N. Y. Application filed March 24, 1873.

A corrugated brace-bar, by means of which the distance between the plows can be regulated, and which allows the plow-standards to be turned so as to throw the earth to or from the plants.

Claim.—1. The corrugated brace-bar G, constructed and arranged in combination with the stocks D D, substantially as and for the purpose herein specified.

2. The combination of the adjustable and reversible hinged

wings E E, constructed and arranged substantially as specified, with the shovel-stocks D D and brace-bar G, substantially as and for the purpose herein specified.

3. The herein-described cultivator composed essentially of the central beam A, shovel-stocks C and D D, adjustable wings E E, corrugated brace-bar G, and beveled-edge shovels H H I, constructed and arranged substantially as herein specified.

138,839.—*Fare-Box.*—HENRY BARANGER, St. Louis, Mo., assignor to JAMES F. CHAPMAN and LAURA H. BARANGER, same place. Application filed October 22, 1872.

A glass case connects the upper part of the box with the treasury. Within it a detaining-shelf is supported by rods connected with two half-cylinders, which are rotated toward one another by a lever attached to one and carrying a shield closing the ticket-opening, which, when pushed away to receive a ticket, tilts the shelf and deposits the inspected fare, and rotates the cylinder to form a receiving-chamber for it. When returned to its normal position the fare drops onto the righted shelf.

Claim.—1. A fare-box consisting of two chambers, communicating with each other by means of a glass passage-way, when said passage-way is divided into two compartments by means of a tilting shelf so arranged, in connection with a fan-wheel or its equivalent below, that the fares will be automatically separated and detained singly in the upper compartment for inspection, and may afterward be collected and detained in the lower compartment for further inspection previous to being turned into the drawer, substantially as herein described and shown.

2. The combination of the cylinders E F with the plate or shield H, constructed and arranged to operate substantially as described.

3. In combination with the cylinders E F, the tilting shelf T, constructed and arranged to operate substantially as described.

4. In combination with the cylinders E F and shield or plate H, the alarm-bell and hammer, operated by a cam on one of the cylinders, substantially as described.

138,840.—*Folding Bedstead.*—ALFRED G. BATLES and JOHN W. H. CARROLL, New York, and GEORGE D. MINER, Williamsburg, N. Y. Application filed April 12, 1873.

The frames are hinged together; the lower frame has four permanent legs, and the upper frame has on its upper face a molding, partly stationary and partly hinged, so that when the bed is opened the hinged part of the molding forms the supporting-legs for said upper frame. A detachable board, provided with lugs and a knob-button, is combined with the recessed sides of the bed-body when folded up.

Claim.—1. An improved folding bed, formed of the two parts A B, hinged to each other, the stationary and hinged moldings D E, and the legs F, constructed and arranged in connection with each other, substantially as herein shown and described.

2. The detachable end board J, provided with lugs K and a knob-button, M L, in combination with the recessed sides of the folding bed-body A B C D E F, substantially as herein shown and described.

138,841.—*Explosive Compound.*—TREAT S. BEACH, New York, N. Y. Application filed April 11, 1873.

Nitrate of potash, wood fiber, and paraffine, or its equivalent, are separately reduced to a powder and thoroughly mixed. Then nitro-glycerine is to be added and all thoroughly incorporated.

Claim.—1. The explosive compound, made of the ingredients herein specified and compounded, as described.

2. An explosive compound, made with any three of the four classes herein specified.

138,842.—*Extension Settee.*—CORNELIUS BEATTY, Elizabeth, N. J. Application filed April 5, 1873.

The settee is provided with sectional extension side pieces, hinged thereto and to each other, and arranged so as to be folded back around the settee when not extended. Said side pieces are supported by legs, and connected together, when extended, by dovetail slats and brace-hooks.

Claim.—1. A settee with sectional extension side pieces hinged thereto and provided with legs, the same being so constructed and arranged as to be folded back around the settee and fastened together, as shown and described.

2. In combination with the sectional side pieces H H, the brace-hooks O O and Q and the dovetail slats M, as shown and described.

138,843.—*Reflector.*—JACKSON O. BELKNAP, Mobile, Ala. Application filed April 11, 1873.

A conical frame, holding plates of colored mica or other material, is suspended between the light and reflector in such manner that the refracted colors may be reflected to the eye.

Claim.—1. The combination and arrangement of reflector A, burner or lamp B, and cone or disk C of colored plates and figures, either stationary or movable, attached to either burner or reflector, substantially as and for the purpose set forth.

2. The arrangement of the stationary or movable colored cone or disk C entirely between the reflector and burner B, substantially as and for the purpose set forth.

138,844.—*Paper-Bag Machine.*—LORENZO D. BENNER, Boston, Mass., assignor to UNION PAPER-BAG COMPANY OF PENNSYLVANIA. Application filed February 7, 1873.

The flat former has grooved sides, into which the tube is folded as it is formed, so as to be four-ply. The lower ply lies under the lower cutting-plate, while the others are above it. The "striker" severs the tube thus disposed into bag-lengths, their ends being closed in the common manner.

Claim.—The combination of the grooved former-block *g*, former-plate *o*, severing-teeth *n*, severing-teeth *q*, and arm *r*, when the parts are so arranged that by upward movement of the arm *r* the full side of the bag end is first cut, and then the inward folding and lapping sides thereby form an end projecting beyond the folds and lapping sides, substantially as described.

138,845.—*Hydraulic Hose.*—LYMAN R BLAKE, Brooklyn, N. Y. Application filed September 25, 1872.

Claim.—A hose formed of a strip of woven material, the edges of which are lapped and united by stitches passing from the outside to the inside, or vice versa, substantially as shown and described.

138,846.—*Cooking-Vessel.*—LAURENCE P. BODKIN and JOHN S. BODKIN, Brooklyn, N. Y. Application filed March 15, 1873.

This vessel has a small grate fixed horizontally on the inside, immediately before a lip projecting from the upper edge.

Claim.—1. The grate E formed upon the inner side of the edge of the vessel A, substantially as herein shown and described.

2. The lip D formed upon the outer side of the edge of the boiler A, in combination with the grate E formed upon the inner side of said edge, substantially as herein shown and described.

138,847.—*Cartridge-Box.*—THOMAS F. BRABSON, Brooklyn, E. D., N. Y. Application filed April 9, 1873.

Claim.—The combination of the ejector *b* and gate *b* with a cartridge-box, A, both the ejector and the gate being operated by a trigger, *m*, substantially in the manner herein shown and described.

138,848.—*Car-Starter.*—STEPHEN R. BRADLEY and ARTHUR C. BRADLEY, Brooklyn, N. Y. Application filed November 26, 1872.

The draft-bar connects, through intermediate levers, with a pawl which engages with a ratchet-wheel, the same being rigidly attached to the axle. When the car is brought to a state of rest the pawl is released, and is held from contact with the ratchet-wheel by means of a hooked bracket.

Claim.—The vertical arms C' C' arranged upon the axle B and upon opposite sides of the ratchet-wheel A, and carrying the sheave R' and pawl C, in combination with the chain or rod P, springs O R, lever F, draft-rod G, spring N, bracket H, and pin K, all constructed, arranged, and operating substantially as described.

138,849.—*Paper Collar.*—CHARLES A. BROWN, Troy, N. Y. Application filed December 14, 1872.

Claim.—A paper or a cloth and paper collar with the extra pieces C and C', forming the double edges of the ends of the collar when extending beyond, and folded in the crease between the collar and the band, as herein described.

138,850.—*Billiard-Table.*—GEORGE BUNTIN, Boston, Mass. Application filed March 21, 1873.

The frame of the table and legs are of cast metal screwed together. The side sections of the main frame are of the same length as the end sections, one pattern serving for the whole six castings.

Claim.—1. The combination, in a billiard-table, of cast-metal end and side sections and cast-metal legs, all connected together so as to constitute the main frame of the table, substantially as set forth.

2. The combination of the main frame with the supplementary frame, composed of cast-metal bars G, connected together and to the said main frame, substantially in the manner described.

3. The combination of the main frame with the supplementary frame and plates H.

138,851.—*Shank for Boots, &c.*—FIELDING PETER BUREN, Trenton, Mo., assignor of one-half his right to SAMUEL MCGEE, Martinsburg, Iowa. Application filed March 14, 1873.

The shank is made of wire bent into proper shape and united at or near the center by soldering or otherwise. A spring or link of tempered wire is looped over the inner end of the wire forming the shank.

Claim.—1. A metallic shank for boots and shoes, made of one piece of round, oval, or flat metal wire, twisted to the desired shape and united in the middle, substantially as and for the purpose set forth.

2. In combination with a metallic wire shank, the spring B, consisting of a separate piece of tempered wire, made and applied substantially as and for the purpose hereinbefore set forth.

138,852.—*Fire-Kindler.*—ALVAH BUSHNELL, Iona Island, N. Y. Application filed October 23, 1872.

A block of wood or equivalent material provided with one or more sockets, which contain a quantity of tallow, paraffine oil, or other combustible material, combined with one or more wicks.

Claim.—1. A fire-kindler, composed of a block of wood or equivalent material, provided with one or more sockets, one or more of which contain a quantity of tallow, paraffine-oil, or other combustible materials, combined with one or more wicks, substantially as described.

2. The combination of a perforated bridge or cap with a block of wood or equivalent material, provided with one or more sockets, one or more of which contain a quantity of tallow, paraffine-oil, or other combustible material or materials, combined with one or more wicks, substantially as set forth.

138,853.—*Sectional Core.*—WILLIAM A. BUTLER, New York, N. Y. Application filed March 10, 1873.

The core is composed of sections, which are held in place by hinged links that reach from one to the opposite section. The links are tripped by means of wires, causing the sectional core to collapse, when it may be removed.

Claim.—1. The combination of the plates *e f g k*, when connected with each other by lap-joints and pins *l*, as specified.

2. A link, D, pivoted to the plate *k*, and held by the spring *j* to the opposite plate *f*, as specified.

3. The strings or wires *m*, combined with the links D of the sectional core, for tripping said links within the core, as set forth.

4. The pins *o*, applied to the sections of the core to connect the same longitudinally, in the manner specified.

138,854.—*Self-Loading Cart.*—ROBERT B. CANTRELL, Tenaſly, assignor to WILLIAM D. RUSSELL, Newark, N. J. Application filed September 16, 1872.

The scoop is connected by arms or rods with a crank-shaft, which is geared with the axle. The wheels are loose on the axle, but, by means of a clutch, are geared with it to rotate the crank-shaft and cause the scoop to assume the proper positions for loading, transporting, and dumping.

Claim.—1. The combination of the scoop or cart-body J, its tail-board M, the three-cranked shaft E, and the rods K K L, substantially as and for the purpose set forth.

2. The combination of the projections *f f* on the hub of one of the supporting-wheels, the coupling-plate O secured to the axle A, the sliding teeth *e e*, the stationary guard-plate N, and the crank-shaft E, geared with the axle, the whole arranged and operating substantially as and for the purpose described.

138,855.—*Electro-Magnetic Motor.*—SAMUEL C. CARTER, Richmond, Ind. Application filed January 17, 1873.

A series of concentric rings carrying coils and provided with radial arms or poles, acting successively as armatures to each other, has a fixed connecting-gear with each so as to secure a different rate of rotation for each, the outer and slowest of the rings being attached to the central shaft, and the necessary intermissions of the current through the revolving coils being effected by their rotations.

Claim.—The described arrangement of two or more concentric drums, having radial armatures, and furnished with insulated coils, having interrupted contact with one pole and continuous contact with the other pole of the battery, said drums being geared differentially to a common counter-shaft, substantially as and for the purpose set forth.

138,856.—*Paddle-Wheel.*—JAMES C. CHAFFEE, Titusville, Pa. Application filed February 21, 1873.

Claim.—The bent paddles D, the flanged hubs C *c'*, and disks E, in combination with each other and with the shaft A, substantially as herein shown and described.

138,857.—*Piano-Pedal Attachment.*—GEORG C. A. CLASS, Philadelphia, Pa. Application filed March 22, 1873.

To enable a child to operate the pedal.

Claim.—1. The stand B having the extension at the rear to pass under the pedal-lyre, and having the rising and outwardly-projecting arm C with lateral foot-rests *c*, substantially as shown and described.

2. The removable rod D for operating the pedal, in combination with the base B having the rear extension to pass under the lyre and retain the stand in position, and having the rising and outwardly-projecting arm C with lateral foot-rests *c*, substantially as and for the purpose described.

3. The screw *b*, in combination with the stand B having an extension to pass under the pedal, as shown, and having the arm C and foot-rests *c*, substantially as and for the purpose described.

4. The movable rod D secured to the pedal by means of an elastic band, in combination with the base and stand B, substantially as shown and described.

138,858.—*Argand Gas-Burner.*—THEODORE CLOUGH, New York, N. Y., assignor to himself, ALONZO T. WELCH, HENRY IDEN, and LORING P. HAWES, same place. Application filed December 18, 1872.

The gas is controlled by a double-beveled valve. The ends of the shade-holders pass through holes in a removable collar, and are beveled so as to fit snugly against the inclined surface of the lower collar.

Claim.—1. The valve having a double-beveled periphery and mounted on a shaft, *b*, in combination with a ring Argand burner, substantially as and for the purpose herein described.

2. As a new article of manufacture, a ring Argand burner having a valve with a double-beveled periphery mounted on a shaft, a strainer, and chimney and shade holders, as described.

138,859.—*Operating Steam or Air Brake.*—SAMUEL F. CLOUSER, Salt Lake City, Utah Ter. Application filed November 20, 1872.

Claim.—The steam-cylinders with their accompanying steam-chests, valves, and valve-working mechanism, in combination with a chain-winding shaft, chain, and continuous rod operating the brake-levers, said cylinders and shaft being directly connected by means of the pistons, piston, and connecting-rods, and the cranks or crank-plates, substantially as and for the purpose specified.

138,860.—*Sofa.*—WILLIAM R. CONGER, Newark, N. J. Application filed March 19, 1873.

The sofa is provided with a hinged front, back, and head, so that either or both the front and back may be let down; and a swivel-screw is arranged under the head so that the head may be adjusted to any desired inclination.

Claim.—1. The combination of the adjustable back C, front G, and head B in a lounge, substantially as shown and described.

2. The swivel-screw I and swivels J K, in combination with the adjustable head B, as and for the purposes described.

138,861.—*Umbrella-Support.*—GEORGE S. COOPER, Baraboo, Wis. Application filed November 14, 1872.

A pin projects transversely from the handle of the umbrella and is inserted into an upright socket, in which is a vertical internal groove leading to a horizontal groove or slot.

Claim.—The holder, composed of a base, A, and an upright socket, B, provided internally with a horizontal groove or slot, *c*, and a vertical groove, *c*, leading to it from the mouth of the socket, substantially as and for the purpose herein set forth.

138,862.—*Handle-Plate for Door-Latches.*—FRANK CORBIN, New Britain, Conn., assignor to P. & F. CORBIN, same place. Application filed April 12, 1873.

Claim.—The handle-plate *a* and escutcheon *b* made in one piece of metal, and receiving the bow-handle *d* and thumb-lever *e*, as set forth.

138,863.—*Shoe-Fastener.*—JONATHAN COTKERDALL, Farmington, Ill. Application filed November 18, 1872.

An improvement upon patent granted to JONATHAN COTKERDALL, September 6, 1870.

Claim.—In the shoe A, open behind upward from the top of the counter, the flaps B C with their straps D *d*, arranged and fastened in the manner and for the purpose as herein shown and set forth.

138,864.—*Rotary Steam-Engine.*—WILLIAM CRAM, New York, N. Y. Application filed March 8, 1873.

A cranked cross-bar, journaled on the sides of the engine, is connected by a lever to the valves on each side, and operated by a cam-wheel on the shaft. A spring on the top, with a projecting end, holds the lever against the cam-wheel.

Claim.—The combination of the cross-bar or yoke K, the lever L, spring N, and cam-wheel M, with the shaft C and stems J of the two valves I, substantially as herein shown and described.

138,865.—*Revolving Cotton-Lint Room.*—WILLIAM T. CRENSHAW, Burton, Tex. Application filed April 5, 1873.

A receptacle for cotton-lint from the gin, divided by partitions, whereby the cotton may be removed from one apartment while another is being filled, and the whole receptacle revolved to bring the empty apartment under the supply.

Claim.—A revolving lint-receiver with two or more compartments, having inlet-passages F and discharging-doors G, arranged relatively to the gin stand and press, substantially as specified.

138,866.—*Sectional Steam-Generator.*—MARSHALL T. DAVIDSON, Brooklyn, N. Y. Application filed October 22, 1872.

A steam-generator having tubes in pairs, the tubes having right-and-left-hand screws, one end of which is screwed into return-bends, the other screwed into corrugated steam or water chamber; the chamber attached to steam and water drums; the whole arranged within the combustion-chamber.

Claim.—1. A water-tube boiler having the rear ends of the tubes coupled together in independent pairs by cast-iron return-bends B, and the front ends of said tubes inserted into a corrugated steam-chamber, substantially as described.

2. The arrangement of the several pairs of tubes having the return-bends and steam-chambers with relation to each other and to the fire-space, substantially as and for the purpose set forth.

3. The combination of independent corrugated steam or water chamber and cast-iron return-bends with water-tubes having right-and-left-hand screw-threads formed on the ends thereof, for the purpose described.

138,867.—*Hydraulic Hose.*—LEVERETT H. DOWNING, North Andover, Mass. Application filed May 9, 1873.

The cemented strip prevents leakage, and the pressure of water only forces it tighter against the same.

Claim.—A hose having the inner surface of the seam covered by the cemented strip *c*, substantially as described.

138,868.—*Stop-Motion for Drawing-Frames, &c.*—ANTHONY J. EARLE, Valley Falls, R. I. Application filed April 22, 1873.

When the slivers break or run thin the trumpet-lever falls, wringing the bolt-lever on its pivot, and projecting the lower bolt so that it will be struck by the wheel F and the motion of the machine be stopped. When the slivers run too thick, or a bunch is encountered, the trumpet is drawn toward the rolls, the trumpet-lever raised, and the upper bolt projected with a like result.

Claim.—The bolts E and D, the bolt-lever C, trumpet-lever B, and trumpet, in combination and arranged with relation to the belt-shipping or clutch-operating device of a drawing-frame, substantially as described.

138,869.—*Printing-Telegraph.*—THOMAS A. EDISON, Newark, N. J. Application filed October 22, 1872.

A stop on the type-wheel shaft is so arranged with an adjustable detent as to allow but a certain number of revolutions without the action of the impression-lever, but is released each time the said lever is moved. The paper-feeding pawl is connected with a slotted link so as to be lifted before the returning arm is moved back; and a cam-like slot in a slide, operated by the printing-lever, is so arranged as to move the type-wheel one letter forward or backward upon its shaft.

Claim.—1. The tooth *o'* and stop 50 upon the shaft *g*, in combination with the arm *o'*, teeth 54, and finger 53, moved by the printing-lever *w*, the parts being arranged and operated substantially as set forth.

2. The pawl *u* upon the arm *v'*, and connected by the link 66 with the lever *w*, in combination with the slotted link 62, that swings the lever *v'* to feed the paper, substantially as specified.

3. The cam 36 moved by the T-lever c' and pins 30 31 upon the printing-lever, in combination with the type-wheel f and sleeve e, substantially as and for the purposes set forth.

138,870.—*Printing-Telegraph.*—THOMAS A. EDISON, Newark, N. J., assignor to THE GOLD AND STOCK TELEGRAPH COMPANY, New York, N. Y. Application filed March 13, 1873.

Electro-motor armatures and shaft can continue to revolve when the pulsator and type-wheel are arrested.

Claim.—The type-wheel and pulsator both upon the same shaft and revolved by friction, in combination with the type-wheel lever, escapement, and electro-magnet, substantially as and for the purposes set forth.

138,871.—*Hat-Press.*—RUDOLF EICKEMEYER, Yonkers, N. Y. Application filed March 31, 1873.

The upper die is moved vertically into contact with the lower stationary die by a pinion upon the main shaft, which engages a quadrant-shaped rack having a counterpoise-weight. As the curved part of the rack is propelled forward, carrying with it two vertical arms—which are guides in a slotted way—under locking-studs, the pressure of the dies is accomplished by the rotation of the cam-shaped quadrant-shaft bearing under said arms. The lower die has an adjustable screw-ring, which governs the space about its brim portion, into which the rubber "shape" is compressed to curl the brim.

Claim.—1. In a hat-pressing machine, a compression-chamber which has a variable and adjustable compressing capacity and incloses a confined elastic India-rubber shape or backing, substantially as described, whereby portions of the latter may be subjected to successively-variable degrees of pressure, as and for the purposes specified.

2. The combination, in the hat-pressing machine, of the elastic brim-curling flange G, the lateral brim-recess in the hat-shell, and the compressing-surface beneath the flange, substantially as described, whereby a lateral pressure is induced into the brim-recess of the hat-shell by the vertical pressure on the elastic flange, as and for the purposes specified.

3. The combination of a press-head with the cross-head of a press by means of a rack and locking-studs, substantially as described and for the purposes set forth.

4. The combination, with the shell or die of a hat-press, of an adjustable rim by which the brim of a hat may be curled and pressed, substantially as described and for the purposes set forth.

5. The combination with the press-head and rack, substantially as described, of a counter-balance, as described, and for the purposes set forth.

6. The combination, with the locking-studs of a hat-press, of the guides or spring-studs for forcing said levers into working position, as described, and for the purposes set forth.

138,872.—*Safety-Bridle.*—JAMES M. ELDER and PETER A. BISHOP, Elyria, Ohio. Application filed February 21, 1873.

Claim.—The chains H D, as arranged in relation to each other, and in combination with the lines L, bit A, and elastic cord K, substantially in the manner as and for the purpose set forth.

138,873.—*Horse-Power.*—WASHINGTON P. EMERSON, Pleasantville, Ky. Application filed March 22, 1873.

A series of vertical shafts arranged in a circle, with pulleys at the lower end, all in the same horizontal plane in which the driving-belt works, the horse attached to a belt working on pulleys, and the upper ends having transmitting-pulleys in different trains, from which the belts work onto a central vertical shaft, which is speeded up, and transmits the motion by a belt from a large pulley on it, thus obtaining rapid motion and dispensing with large wheels or pulleys.

Claim.—1. The combination of a series of pulleys, B, and a driving-belt, C, in the manner described.

2. The combination of a counter-shaft and pulleys H with the belts G, pulleys E, and the driving-belt C, as described.

3. The pulleys B arranged in radial adjustable bearings, as described.

138,874.—*Leather-Dressing Machine.*—JOHN A. ENOS, Peabody, Mass., assignor to JAMES M. CALLER, trustee. Application filed February 6, 1873.

The dressing-tool, cylindrical in form, is provided with a large number of steel blades, set about one-quarter of an inch apart and pitched at an angle of about forty degrees, so that opposite ends of each blade are nearly upon opposite sides of the axis of the cylinder, so that the edge of each blade comes to the work progressively and gradually. A grinding-roll is provided and means devised that it may automatically traverse across the working-face of the dressing-tool.

Claim.—1. In a leather-dressing machine, a tool having, in addition to a traversing movement in contact with the work and a return movement out of contact therewith, a positive rotation in a retrograde direction, by means substantially as described.

2. In combination with the traversing tool-stock, the system of shafts and pulleys, substantially as described, by which the rotating tool is driven.

3. The leather-dressing tool, provided with parallel spiral blades, arranged and constructed substantially as described.

4. In combination with the traversing tool-stock, the whitening or buffing tool and the grinding-roll, constructed and operated substantially as described.

5. The bed-block supported upon weighted levers, substantially as described.

138,875.—*Steam-Boiler Furnace.*—MICHAEL A. FOSTER, St. Louis, Mo. Application filed March 20, 1873.

The non-consumed gases collected in a chamber at the rear of and under the boiler are returned by means of steam-jets into a semi-elliptical combustion-chamber back of the fire, said gases being mixed with air, heated on its passage, and forced through a pipe which connects with the air at the outside and rear of the furnace.

Claim.—1. The return-pipes or passages B, in combination with steam-jets c and smoke-pit A, substantially as set forth.

2. The combination of the pipes B, jets c, and semi-elliptical smoke-pit A, substantially as set forth.

3. The combination of the pipes B, steam-jets c, smoke-pit A, and dampers b, substantially as set forth.

4. The pipes B, in combination with the pits A and D, steam-jets c and e, and air-pipes E, substantially as set forth.

5. The combination of pipes B, semi-elliptical pits A and D, steam-jets c e, air pipe or pipes E, and dampers b, substantially as and for the purpose set forth.

138,876.—*Crane.*—FRANKLIN FARREL, Ansonia, Conn. Application filed January 22, 1873.

A crane having a chain-wheel for a hoisting medium and a receptacle for receiving the slack chain, when the wheel and receptacle both bear the same relation to each other. The base of the jet is provided with rollers for bearing against the post.

Claim.—1. The combination, in a crane, of a chain-wheel as a hoisting medium, and a receptacle for receiving the slack chain when both wheel and receptacle bear the same relation to each other, no matter what position the crane may be moved to.

2. The base D of the jib, having rollers for bearing against the post, and a receptacle for receiving the slack chain.

138,877.—*Copy-Holder.*—STEPHEN FRENCH and RUFUS D. CHASE, Orange, Mass. Application filed April 12, 1873.

An inclined table provided with rolls at the upper end, which feed the manuscript line by line, drawing it between the table and a recessed plate.

Claim.—The combination of a board, table, or desk, A, slotted plate B, and carrying-rolls C, substantially in the manner described.

138,878.—*Curtain-Cord Fastener.*—CHARLES GAMMEL, Utica, N. Y. Application filed March 29, 1873.

The screw-rod bears the pulley at its upper end, and is slotted longitudinally to receive a pin projecting from the inner side of the socket-plate. The pulley is tightened by the nut on the lower end of the screw-rod.

Claim.—The slotted screw-rod B, having nut D and pulley C, combined with pin E and socket-plate A, as and for the purpose described.

138,879.—*Shutter-Worker.*—AUGUSTUS H. GIBBS, Norwalk, Conn. Application filed February 12, 1873.

A bent lever is pivoted upon the sill, inside of the sash, and its short arm is secured at any desired position by a set-screw working in a curved slotted guide. The outer end of the lever is pivoted to a curved link, which turns the corner of the shutter, and is then pivoted to the side of the frame.

Claim.—1. The bell-crank lever d e pivoted at f on the outside sill, one arm of which is pivoted to the curved link c of the bracket b, while its other arm connects with the adjustable button g, moving in the guide-plate A, secured to the sill inside of the window, the whole combined and arranged, substantially as described, for operating a window-shutter or blind, as set forth.

2. The bell-crank lever d e pivoted at f on the outside sill, in combination with the curved link c, said link being pivoted to the bracket and to the lever, as shown, for operating in connection with the button g moving in the guide-plate A arranged on the sill inside of the window, the several parts being constructed, substantially as described, for opening and closing a window-blind, as set forth.

138,880.—*Supplementary Heater for Steam Fire-Engines.*—RICHARD GILBERT and JOHN P. TOPHAM, Rochester, N. Y. Application filed February 21, 1873.

A heater consisting of a central magazine and an annular water-wall, between which are arranged a series of vertical dependent water-legs, each leg being provided with an inner circulating tube, and the water-wall, connected at top and bottom with the steam fire-engine boiler, is carried on the platform of the engine to heat the water and keep up a constant circulation, so as to be ready for instant use and assist in generating steam quicker than in the usual way.

Claim.—1. In combination with the main boiler of a steam fire-engine, a supplementary heater or boiler, C, connected with the main boiler by pipes E E' when said supplementary heater is constructed with vertically-arranged water-legs D, a water-jacket, b, and a central magazine, d, all constructed and operating substantially as described.

2. In a supplementary heater for fire-engines, the series of vertically-arranged water-legs D located between the central magazine d and the walls of the heater, each leg being provided with an inner tube, g, open at both ends, substantially as described, for the purpose set forth.

3. The supplementary heater C, constructed with the water-jacket b, depending hollow water-legs D D, and central magazine or fuel-chamber d, and connected with the main boiler of the engine by pipes E E', in the manner and for the purpose specified.

138,881.—*Sewing-Machine Brake.*—RUFF GLADNEY, Buena Vista, Miss., assignor to EDWARD H. HOTCHKISS, New York, N. Y. Application filed October 8, 1872.

Elastic roller with a flexible or swinging plate having a notch in one end of the plate to receive the journal when shifted.

Claim.—1. The combination, with one of the journals of the roller D, of a flexible or swinging bearing-plate, C, essentially as and for the purpose described.

2. The combination of the notch g in the end of the bearing-plate C', the journals of the roller D, and the head f, formed on the end of one of said journals, substantially as and for the purpose set forth.

138,882.—*Water-Gage and Feed-Indicator for Steam-Boilers.*—ANDREW S. GOODRICH, New York, N. Y., assignor to himself, ALEXANDER POLLOCK, and GEORGE VAN WAGENEN, same place. Application filed January 18, 1873.

The ordinary glass-tube water-gage is connected at its lower end with the feed-pipe of the boiler, so that the action of the feed-pump may be observed by the fluctuations of the gage. The connecting-pipe is provided with a cock for separating the gage from the pump when desired.

Claim.—The pipe C, connecting a water-gage, attached to a boiler or other receptacle, with a pump or feed-pipe, as set forth.

138,883.—*Channel-Opener for Boots, &c.*—FREDERIC GUSCETTI, New York, N. Y., assignor of one-half his right to CALVIN W. SMITH, same place. Application filed February 3, 1873.

A channel-opener is attached to the machine so as to follow the channeling-knife, pressing the raised lip down and over upon the surface of the sole preparatory for sewing.

Claim.—The above-described channel-opener D, when applied to a channeling-machine, and constructed and arranged to operate substantially in the manner and for the purpose set forth.

138,884.—*Picture-Frame.*—HENRY S. HALE, Philadelphia, Pa., assignor to HALE, KILBURN, & Co., same place. Application filed November 14, 1873.

Connects a projecting and protecting strip or strips of lacquered or water-proof material with the edges of the inner gilt portion or molding of the frame, so that the glass covering the picture can be washed without injury to such gilt edge or molding.

Claim.—The combination, in a frame or molding, of a gilt surface and a projecting rib or guarb, b, arranged at the inner or lower edge of the gilt portion, as and for the purpose specified.

138,885.—*Combined Adjustable Fire-Fenders, Grates, and Andirons.*—WILLIAM N. HALL, Mexia, Tex. Application filed March 22, 1873.

The fire-fender, andirons, and grate can be used together, or two of the parts may be combined, or the andirons used alone. The apparatus, as a whole, may be adapted for any-sized fire-place and for burning wood or coal.

Claim.—1. Andirons cast or made in two pieces, A and B, and locked by a pin, a, or other suitable device, as described.

2. Andirons provided with tenants or projections b, to receive and secure mortised grate-bars c, in the manner and for the purpose described.

3. Andirons provided with locks arranged to receive and hold the fender-bars, in the manner described.

4. The combined andirons, grate, and fender, constructed and arranged substantially as herein described.

138,886.—*Work-Box.*—ELANDER HEATH, San Francisco, Cal. Application filed April 3, 1873.

The holes form receptacles for spools. The central depression is rounded out to facilitate the removal of small articles. The edges of the box and lid, where they hinge, are beveled to prevent the hinges projecting beyond the box when closed.

Claim.—1. The box A provided with holes B B, and depression C having rounded ends, substantially as and for the purpose described.

2. The combination of the box and lid, when provided with beveled edges E F, as set forth, for the purpose specified.

138,887.—*Breech-Loading Fire-Arm.*—JOHN SIDNEY HEATH, Thomas street, Oxford street, Middlesex county, England. Application filed September 6, 1872.

Combinations claimed whereby the firing-pins are automatically withdrawn in the act of cocking the gun and caught or held back to prevent accidental discharge until released by the operator at the time of firing.

Claim.—1. The combination of a firing-pin, a lever, g^x, a locking-bolt, f^x, and suitable mechanism for operating the same, as specified.

2. The combination of the lever or thumb-piece No. 1, levers Nos. 2 and 3, and spring e' with the firing-pin, stop-bolts, and the levers g^x, as shown and described.

3. The combination, with the levers g^x and firing-pins f^x, of the tumblers M, a scar, and co-operating springs S g and M s, as specified.

138,888.—*Reciprocating Churn.*—GEORGE M. HEIM, Brownsville, Ind. Application filed March 22, 1873.

A barrel-shaped churn is eccentrically hung within a frame-work and receives an oscillating motion through a system of levers operated by a crank. Said mechanism is arranged within the frame so as to economize space.

Claim.—In combination with the oscillating or vibrating churn-body a, the crank-shaft f, crank i, levers n i, and pivoted rod o, when arranged to operate substantially as set forth.

138,889.—*Telegraph Cut-Out and Switch.*—ROBERT HENNING, Ottawa, Ill., assignor to himself and J. D. CATON, same place. Application filed February 8, 1873.

Two plates insulated from each other, having line and instrument connections, are cut through near their centers so as to break circuit. Insulated button, with two metallic stripe on base, pivoted at break, so that, by turning it completes circuit to or cuts out the instrument. Ground connected to either plate by switch-peg.

Claim.—A switch and cut-out formed of two parallel plates, with line, local, and ground wire connections, adjustable button, and metallic peg, as and for the purpose described.

138,890.—*Axle and Axle-Box for Vehicles.*—FRIEDERICH HUNSINGER, Morrisania, N. Y. Application filed March 15, 1873.

The grooves are parallel and disconnected, and a shoulder on the box and axle tends to prevent the escape of the lubricant.

Claim.—The box B having the parallel grooves C and offset D, in combination with axle A, as and for the purpose described.

138,891.—*Revenue-Stamp.*—ROBERT F. HUNTER, Staunton, Va., assignor to himself and A. F. RANDALL, Washington, D. C., assignors of part interest to THOMAS HOOD and ORIE F. PERRERT, same place. Application filed May 31, 1871.

Claim.—1. The method herein described of stamping cigars and insuring thereby the certain collection of the Government tax thereon, by means of a general stamp applied to the holding box or package having figures and characters imprinted on its face, indicative, respectively, of its own number and the number of cigars in the box or package to which it is attached, and detachable or accompanying coupons imprinted in like manner as the stamp-head, with corresponding numbers, figures, and characters applied to and attached to each individual cigar in such box or package contained, substantially as and for the purpose above set forth.

2. A cigar-stamp, constructed substantially as herein described and shown, applied in the manner and for the purpose specified and set forth.

138,892.—*Folding Chair.*—GEORGE HUNZINGER, New York, N. Y. Application filed April 29, 1873.

The chair is made of cross-legs, pivoted at the intersection and combined with a bow that constitutes the back and arms. The ends are connected to the slotted ends of the rear legs, and the rear part of the bow is connected by pivots to the upper ends of the front legs. The seat turns on the front cross-bar, and rests on the back cross-bar and also on the flexible straps extending from the back to the front cross-bar.

Claim.—1. The bow d connecting the top ends of the cross-legs a b and forming the back and arms of the chair, as set forth.

2. The flexible material extending from the back d to the cross-bar n, in combination with the seat A connected to the legs a c by the cross-bar k, and resting, when in use, on said cross-bar n, substantially as set forth.

138,893.—*Mechanism for Looms.*—THOMAS ISHERWOOD, and WILLIAM NUTTALL, Westerly, R. I. Application filed April 5, 1873.

In place of a stationary vertical grid on the lay at the sides of the loom two or more wires are presented between the path of the weft-thread and at the middle of the lay when the lay beats up, and are then withdrawn below the surface of the lay before the shuttle is thrown. The weft-fork is hinged to a vibrating arm on a rock-shaft supported in brackets on the lower cross-beam, and, after the picking movement, it is carried toward the weft-thread and withdrawn in time to be out of the way of the lay at the beat-up. When the weft fails the arm of the fork strikes the end of a vertical lever, also attached to a rock-shaft under the breast-beam, and through suitable connections the shipping-lever is operated.

Claim.—1. The combination, with the lathe, of the wires A and mechanism, substantially as described, for presenting them behind the weft and withdrawing them in the manner set forth.

2. The combination of the rock-lever O, arm Q, cam R, and feeler and latch with the lever N, for operating the shipper-lever, all arranged to operate in the manner described.

3. The combination of the wires A, arranged and operating with the lay, as described, and the feeler and latch, as set forth.

138,894.—*Ear-Protector.*—MORITZ ISIDOR, New York, N. Y. Application filed April 5, 1873.

Claim.—1. As a new article of manufacture, an ear-protector having its front side made partly of cloth and partly of gauze, as shown and described.

2. The elastic cord F, in combination with the ear-cover, constructed as described.

138,895.—*Plow.*—WILLIAM B. JACKSON, J. MORRIS CHILDS, and ORLANDO J. CHILDS, Utica, N. Y. Application filed March 21, 1873.

Claim.—A draft-clevis provided with a series of holes, and a tongue projecting inward from its head, for the lateral adjustment of a draft-hook, in combination with a clevis provided with a series of ratchet-teeth to engage said tongue, for the vertical adjustment of said draft-clevis, substantially as described.

138,896.—*Drawing-Board.*—WILHELM KEUFFEL and HERMANN ESSER, Hoboken, N. J. Application filed February 5, 1873.

The drawer containing the drafting materials, &c., is locked in place by the T-square passing sidewise through both it and the two supports in which the drawer is hung.

Claim.—1. The ribs a and drawer B, when notched or perforated to receive the T-square, as set forth.

2. The T-square combined with a drawing-board, A, and drawer B, to hold the latter closed, substantially in the manner described.

3. In combination with the drawing-board A, the pivoted rods or bars D D, applied to the back edge of said drawing-board, substantially as and for the purposes described.

138,897.—*Sewing-Machine Brake.*—CHARLES E. KIMBALL, New York, N. Y. Application filed March 10, 1873.

Claim.—The stationary hanger D, the wedge E fitted thereto, made of elastic material or faced therewith, the pin a, and the slot b, the whole combined and arranged for application in relation to

the fly-wheel of a sewing-machine, substantially as and for the purpose set forth.

138,898.—*Sewing-Machine*.—FREDERICK KOCH and ROBERT BRASS, Brooklyn, assignors to JOHN BOYLE, New York, N. Y. Application filed March 1, 1873.

The presser slides through a block, to which is pivoted an elbow-lever, the short arm of which, when the lever is turned by a cam, bears against the presser-shank and holds it firmly in the block, and so that the presser cannot rise.

Claim.—The lever and block, in combination with and for intermittently holding the presser, as set forth.

138,899.—*Railway-Car Seat*.—BERNARD J. LA MOTHE, Detroit, Mich. Application filed September 17, 1872.

The legs of the chair pass through the floor of the car and rest upon a spring underneath, the bottom of the slides in bearings, and is locked by means of a lever and rack. The back of the seat is reversible, and is composed of spring-wires strengthened by cross-pieces.

Claim.—1. The metal frame *h* of the seat sliding in and supported by the bearings *e*, and containing the spring-wires *i* bent double and connected in pairs, substantially as and for the purposes set forth.

2. The center-bar *k* and stop-lever *l*, in combination with the sliding metallic seat-frame *h* and springs *i*, substantially as set forth.

3. The end frames *a a*, passing through the floor or cleats and attached to the springs *c*, as and for the purposes set forth.

138,900.—*Feathering Paddle-Wheels*.—ALEXANDER LEFEBVRE, San Francisco, Cal. Application filed March 5, 1873.

A pinion on the end of the paddle-shaft operates a rack-bar reciprocally, which rack-bar gives motion, by the interventions of levers and cams, to sliding rods on the arms of the wheel and attached at their outer extremities to the paddle-floats. By these devices the floats are caused to be automatically moved inward toward the shaft, and outward again as they come in rotation to strike the water.

Claim.—1. The operating-bars I and K, connected with the sliding bar L by the joint M, in combination with the connecting and vertical bars, and the rack O and the pinion P, substantially as and for the purpose described.

2. The rack O, having its outer tooth at each end pivoted at *r*, so as to be operated by the pinion, substantially as and for the purpose described.

138,901.—*Veneer-Cutting Machine*.—JOHN W. LESLIE and GEORGE R. SMITH, Cairo, Ill. Application filed March 15, 1873.

The pressure or gage roll is supported by placing at its back two additional rolls.

Claim.—A small pressure-roller, C, arranged to bear upon the wood directly above the edge of the cutter, with the re-enforcing pressure-rollers acting upon it, substantially as specified.

138,902.—*Sewing-Machine*.—CYRUS LEWIS and JOSEPH SOOTHILL, Howard, Ill. Application filed January 11, 1873.

A shuttle-race of glass is sustained in a metallic support and between the two there is a layer of some elastic or holding substance.

Claim.—The combination, with a glass shuttle-race and its metallic support, of an elastic bed, as and for the purpose set forth.

138,903.—*Cheese-Cutter*.—JOHN LOCKE, Lewisburg, Pa. Application filed November 7, 1872.

To a suitable counter or stand is attached a bed-plate by a clamp and screw, the clamp-arm extending as a guide for the arm of the knife. The knife is operated by a spring-treadle.

Claim.—1. The guiding-clamp *c*, when used to secure the bed-plate to the counter, and to guide the knife, substantially as set forth.

2. The spring-treadle *h*, in combination with a cheese-cutting device, substantially as described.

3. A cheese-cutting machine consisting of a removable bed-plate and rotary table, a spring-treadle to operate the knife, and a guiding-clamp and set-screw to secure the bed-plate to the counter, when all are arranged to operate substantially as shown and described.

138,904.—*Folding Table, &c.*—HENRY LOTH, Philadelphia, Pa. Application filed March 25, 1873.

The whole of the legs are connected together by means of two compound hinges, one of the hinges being secured to the upper edges and the other to the lower edges of the legs. Each hinge is composed of as many sections as there are legs to the table.

Claim.—A folding table or other article, the whole of the legs of which are connected together by two hinges adapted to the upper and lower edges of the said legs, substantially as described.

138,905.—*Brick-Kiln*.—ALBERT W. M. MAASS, Chicago, Ill. Application filed January 11, 1873.

Improvement on patent to F. E. Hoffman, June 13, 1865. The smoke-channels or the radial partitions forming the compartments connect said compartments alternately at opposite ends. Two iron sliding or drop doors open or close connection between the compartments.

Claim.—1. The circular arch, divided into radial compartments, communicating with each other alternately at the inner and outer ends, and provided with the movable slides X X', as and for the purpose set forth.

2. The arrangement, with relation to the stack R, smoke-chamber P, and compartments A, B, C, &c., of the smoke-channels *a*, *b*, *c*, &c., valves *v*, openings T, channels *g*, gates *t*, air-channels *s*, covers *s'*, fuel-holes *u*, and draft-channels *r*, substantially as and for the purpose set forth.

138,906.—*Tan-Vat*.—CHARLES H. MANNING, Washington, D. C. Application filed March 17, 1873.

Claim.—A vat or cistern, with a frame-work of wood, or iron and wood, as shown and described, with its outer and inner sides covered with cement, substantially as and for the purpose herein specified.

138,907.—*Compound Explosive Projectile*.—FRANK A. MARKLEY, Waynesborough, Va. Application filed April 5, 1873.

Claim.—The explosive projectile, consisting of main cylinder A, in connection with auxiliary shells C, held together by rod B and plate F, substantially as described.

138,908.—*Carbonic-Acid Generator, Fountain, and other Vessels*. JOHN MATTHEWS, New York, N. Y. Application filed May 7, 1873.

An outer shell of cast-steel is lined with lead or porcelain, or, when lead would be objectionable, tin, or copper coated with tin or silver, is used for the lining. In some cases glass may form the lining. The object is to make these vessels very strong, light, and not liable to be corroded.

Claim.—The improved vessel or generator herein described, consisting of a shell of steel formed by casting in molds, and lined with lead or porcelain, substantially as set forth and described.

138,909.—*Hay and Cotton Press*.—WILLIAM H. MCBURNEY, Sacramento City, Cal. Application filed February 21, 1873.

Claim.—The levers C L, connected by bars I N, the jointed bars X Y, and the eccentric wheels, combined and applied as and for the purpose described.

138,910.—*Hoisting and Conveying Apparatus*.—OLIVER T. MCINTOSH, New York, N. Y. Application filed April 1, 1873.

The attendant within the box determines the starting and stopping of the car by means of the brake, and also operates the locking device, so as to regulate the raising or lowering of the block as may be desired.

Claim.—1. In a hoisting and conveying apparatus, the combination of brakes to the wheels for stopping the car with the blocks, pulleys, and rope for raising or lowering a weight and moving the car upon an inclined railway, substantially as set forth.

2. The strap *o* at the upper end of the block *k*, in combination with the conical opening *r* and the bolt *s*, moved by the lever *u*, and under the control of the attendant, as and for the purposes set forth.

3. The car *a*, containing a box, *d*, for the attendant, and supported by wheels upon an elevated railway, in combination with the brakes *e* for the wheels, the block *k* and rope *g* for raising the weight, and the hand-lever *u* and bolt *s* for sustaining such weight, as set forth.

138,911.—*Brick-Layers' Pointers*.—JOSEPH S. MERRIKEN, Baltimore, Md. Application filed October 7, 1872.

The "pointer" has a pair of chaneled rollers revolving in a cast-iron frame, and a brush is arranged on each side of the "point," to clear away surplus mortar.

Claim.—1. A pointer for brick-layers' use, consisting of a holder, two rollers, and one or more brushes between said rollers, substantially as herein set forth.

2. The holder A, cast in one piece with the handle B, and having mortises *a a* and dovetailed grooves between said mortises, substantially as and for the purposes herein set forth.

3. The roller C, provided with a circumferentially-grooved flange, *d*, around its center, and arranged in a suitable holder, substantially as and for the purposes herein set forth.

4. The combination of the holder A with handle B, rollers C C, with flanges *d d*, and brushes D D, all constructed and arranged substantially as and for the purposes herein set forth.

138,912.—*Car-Coupling*.—HIRAM MILLARD, Philadelphia, Pa. Application filed November 1, 1872.

To "set" this device for coupling, the pin is raised and passed obliquely forward in the slot on the top plate, from whence it is forced by the entering link, when it falls through it, and coupling is effected. When it is desired that the draw-heads should be together without being coupled the short arm is allowed to rest in the slot at right angles to *g*, and the foot-piece is turned into the step on the bottom of the plate B.

Claim.—1. The coupling-bolt E, having a foot, *h*, in combination with a draw-bar, having in its upper plate A a slot, *d*, hole *e*, and grooves *g g*^{2}, and in the lower plate B a slot, *d'*, hole *e*, and groove *g*^{1}, substantially in the manner and for the purpose set forth.

2. The combination of the inclined wings *a a* with ordinary bumper-plates C C for guiding the outer end of the link D into the right position for coupling, substantially as described.

138,913.—*Track-Clearers*.—JAMES H. MILLER, Fredericton, New Brunswick. Application filed January 2, 1873.

The front ends of the clearers are pivoted to the pilot, and the clearer may be raised or lowered by means of a rock-shaft.

Claim.—1. In combination with the pilot or cow-catcher of a locomotive, the clearers *b b*, consisting of flat metal plates with openings *c* therein, pivoted to the pilot, near the front end thereof, by a pivot passing through the forward end of the plate, allowing a vertical motion to the rear end of the clearer—the openings *c* to embrace the track so as to remove the snow from the sides or flanges as well as from the top—substantially as and for the purposes set forth.

2. In combination with the clearers *b b* secured to the pilot A, of rods *i i* and rocker-bar *j*, with its arm *k* and lever *l*, substantially as set forth.

138,914.—*Wood-Filling and Paint Compound*.—JOHN MILLER West Salem, Ohio. Application filed April 12, 1873.

Coachmaker's Japan, spirits turpentine, raw linseed-oil, English carriage varnish, French amber, white lead ground in oil, lampblack.

Claim.—The painting compound herein described, composed of the materials and in the manner substantially as specified.

138,915.—*Preparing and Packing Water-Colors*.—EDWARD L. MOLINEUX, Brooklyn, N. Y. Application filed April 19, 1873.

Sheets of card-board or other substance, prepared to prevent them from absorbing the colors, are painted with one or several coats of colors prepared with sufficient sizing, and as one coat dries another is added until the desired thickness is formed. The sheets are then dried, cut into pieces, and made into portfolios, &c.

Claim.—The method of preparing and putting up water-colors in sheets or tablets for painting and toilet uses, substantially as herein shown and described.

138,916.—*Journal-Boxes*.—JOSEPH R. MORRIS, Houston, Tex. Application filed April 3, 1873.

A journal-box having a two-part bearing with an intermediate oil-reservoir; also an arm which supplies the journal with oil at each revolution; and the annular disks, which prevent the lubricant from escaping from the box and return it to the recesses and thence to the reservoir.

Claim.—The combination of the journal-arm *e* and annular disks *f f*, in combination with the bearings A A, intermediate oil-reservoir, outside recesses, and inclined channels, all as and for the purpose specified.

138,917.—*Rubber Cements*.—WILLIAM MOSHIER, Norwalk, Ohio, assignor of one-third his right to CHARLES T. MERRY, same place. Application filed February 15, 1873.

Virgin rubber is dissolved in benzine and isinglass, and chloroform added.

Claim.—The rubber cement described, compounded of the ingredients in the proportion substantially as specified.

138,918.—*Farm-Gates*.—HORACE W. MULLENNEX, Alpine, N. Y. Application filed January 6, 1873.

A short gate-post, opposite the latch end, has two bracketed frames swiveled upon it, one near the base and one at the top. A horizontal gate-rail passes through each frame upon friction-rollers. The gate slides open and shut supported by these rails, but when partly open may be turned a quarter-circle, the brackets revolving upon the short post.

Claim.—The two frames B B, having rollers *b b* and sleeves *d d* swiveled on supports *c c* of a post, C, as and for the purpose described.

138,919.—*Reversible Latches*.—WALLACE T. MUNGER, New Britain, Conn., assignor to P. & F. CORBIN, same place. Application filed April 12, 1873.

The latch-case is constructed with an opening through it, in which projects an arm that is operated for withdrawing the latch. This arm is central, so that the case may be reversed for the bevel of the latch to stand in either direction, thus adapting the latch to a right or left hand door.

Claim.—1. The latch-case made with an opening, *p*, through the same, in combination with the trident *k l m*, yoke *f*, and latch *d*, substantially as set forth.

2. The case of the latch made with an opening, *p*, through the same, in combination with the latch mechanism and the arm *w*, occupying a central position in such opening to allow the latch-case to be reversed, substantially as specified.

138,920.—*Car-Spring*.—EDWARD MYERS, Jersey City, N. J. Application filed April 26, 1873.

Concentric flanges formed upon the follower have their bearings upon graduated spiral springs, which are inclosed in corresponding concentric flanges formed upon the bearing-plate.

Claim.—1. The concentric graduated springs C, each inner spring being made shorter than the next outer one, arranged in spaces between concentric ring-flanges formed upon the end plate of one or both parts of the case, and to be operated upon by a similar set of concentric ring-flanges formed upon the end plate of the other part of the case, substantially as herein shown and described.

2. The combination of a central draft-rod, D, with the double concentric graduated spring A B C, substantially as herein shown and described.

138,921.—*Window-Sash*.—DAVID W. NOYES, Bennington, Vt. Application filed April 12, 1873.

The glass is retained in its place in the sash by means of a hinged frame in place of putty, and is edged with rubber so as to form a tight joint. The hinges are furnished with screw-threads, and the fastening-button is also screw-threaded, thus affording a means for adjusting the compression of the frame to the thickness of the glass used. The glass is interchangeable with wire-netting or other material.

Claim.—1. The combination of the frame A, door D, and screws *f f'* with the interchangeable glass C and wire frames *d* and A, substantially as specified.

2. The screw *f'*, having flanged head, as described, in combination with the frame A and door D, constructed and arranged substantially as and for the purpose described.

138,922.—*Type-Setting Machine*.—SAMUEL H. OWEN, Philadelphia, Pa. Application filed January 10, 1873.

The type are delivered from radially-arranged reservoirs by holders rocked by the keys, from which they are pushed by its toe into a receiver traveling in a circular path, and delivered onto a pusher-bar by an arm thereon. This bar is reciprocated by a cam-slot in the carrier, and discharges the type onto a ledge, which, rocking, delivers it onto a stick composed of winged spindles. A full line is dropped onto a spring-plunger by turning the spindles one-fourth of a revolution. A justifying-case filled with spaces is reciprocated over the line of type, and when its toe, passing freely through the nicks of the letters, is raised by the blank spaces, the case is moved in the other direction, moving part of the line and allowing a space to be pushed in by the vibrating lever.

Claim.—1. The combination of a series of type-holders, holding type lying horizontally and arranged radially, and a rotating carrier or carriers passing beneath the holders, receiving type which descend therefrom, and conveying the same to one point, substantially as specified.

2. A receptacle in which the type is deposited by the carrier, in combination with a pusher-bar, D, operating as set forth.

3. The combination, with the type-reservoir A, of a spindle, K, constructed substantially as described, and operated by means of a key through the medium of the devices described, or any equivalent devices.

4. The combination of the spindle K and its arms *b*^{1} with the projections *h h'* of the carrier.

5. The combination of the spindle K and its type-holding arms *b*^{1} with the projection *g* of the carrier.

6. The carrier B, constructed substantially as described, with a fixed portion, *c*, pivoted portion *c'*, and pocket for the reception and retention of the type.

7. The combination, substantially as described, of the stationary projection *f'* with the fixed and pivoted portions of the carrier B.

8. The combination of the rotating slotted plate E with the pusher-bar D, substantially as specified.

9. The combination, substantially as described, of the receptacle in which type is deposited by the carrier, the pusher-bar D, the tilting lever M, and the stick.

10. A stick for type-setting machines, consisting of two parallel spindles, F, having arms for the support of the type, and from which the latter can be discharged into a receptacle beneath, by a simultaneous move of the two spindles, all substantially as specified.

11. The combination, with the type-supporting spindles F, of a cross-head acted on by a spring or otherwise, and maintained in contact with the type.

12. The combination, with the stick and galley, of a justifying apparatus operating in the space beneath the stick and above the lines of type in the galley.

13. The intermittently-moving case H, with its projection or projections *t*, adapted to the nicks *v* of a line of type, but arranged when moved in one direction to strike the blanks *x* between the said type, and to thus separate the latter, for the purpose specified.

14. The combination, substantially as described, of the case H, its lever Q, the stops *q*, aperture *x*, and line of blanks *w*, maintained in contact with the said stops *q* by a spring-plunger *r* or equivalent device.

138,923.—*Vapor-Burner*.—FRANKLIN G. PALMER, Pittsburg, Pa., assignor to himself and JASON J. PALMER, same place. Application filed October 21, 1872.

The regulating-valve is attached to and movable with the burner-top, which screws upon the feeding-table. By turning the top the valve is made to approach or recede from its seat.

Claim.—The spindle or spindle-point *d d'*, attached to or forming part of a burner or burner-top, inverted and above the generator, and acting as specified, all substantially as set forth.

138,924.—*Manufacture of Cement*.—JOHN E. PARK, La Vergne, Tenn. Application filed April 6, 1871.

Composed of any of the forms of lime, with thirty to forty-five per cent. of clay, five to ten of fine sand, and five per cent. of soda (carbonate, muriate, or caustic) or potash. These materials are mixed together and moderately worked into union. The mass is then dried, then broken up, and burned in a kiln until it produces a bright sulphur color, both externally and internally.

Claim.—1. The hydraulic lime or cement composed of the ingredients in the proportions specified.

2. The process of preparing and calcining the cement, as set forth.

138,925.—*Candle-Lamp*.—JULIUS A. PEASE, Boston, Mass. Application filed May 1, 1873.

The outside shell of the candle is made of adamantine and filled with crude paraffine, tallow, or other more fusible candle-stock. The candle is placed in a tube having a coiled spring in the lower end. This feeds up the candle as it is burned away. At the upper end of this tube are placed the drip-cup, the short wick-tube, and the perforated cone. There is no metallic contact between the cone or the candle-tube or the wick-tube, so that the heat from the burner is not conducted to the candle-tube.

Claim.—1. The compound wickless candle, made of a shell of hard candle-stock and a central filling of other material, substantially such as specified.

2. The combination of the candle-tube and drip-cup with the wick-tube and perforated cone, in the manner described, so that the cone and wick-tube do not come in contact with the candle-tube, as and for the purpose set forth.

138,926.—*Shank-Laster.*—RICHARD B. PERKINS, Almond, N. Y. Application filed April 5, 1873.

A guard-wheel provided with a spring-locking device is attached to the fulcrum-arm, that it may be adjusted to boots and shoes of different sizes.

Claim.—1. The curved lever A, in combination with pincher end B having arm C, with spring-lever E, substantially as described.

2. Guard-wheel D having flange *f* connecting bridge *g*, with perforations for pin *h* to regulate it when turning on pivot *i*, substantially as described.

3. The combination of the curved lever A, hinged jaw B, arm C, wheel D, with flange *f*, spring-lever E, and pin *h*, as shown and described.

138,927.—*Boring-Machine.*—HIRAM PITCHER, Fond du Lac, Wis. Application filed February 8, 1873.

A series of augers is arranged to be adjusted at equal or varying distances, and secured by one clamp for the whole series.

Claim.—1. The combination of the movable driving-wheels *b* and movable bearings *d*, substantially as set forth, when connected together as described.

2. The combination of the lever *l*, adjustable rings *n*, and the movable bearings *d*, and forked levers *o*, so that the borers can be made to work at equal or unequal distances apart, substantially as shown and described.

3. The shaft, driving-wheels, pinions, adjustable bearings, forked levers, and adjustable rings, when all are combined to operate as set forth.

138,928.—*Washing-Machine.*—DANIEL B. POND, Woonsocket, R. I. Application filed April 12, 1873.

The washing-machine is constructed with corrugated wire-cloth, with a bed of rolls suspended under it, by coiled springs attached to the outer frame or sides of it.

Claim.—The washing-machine having the spring-rollers and the cylinder K, consisting of the shouldered ends and the wire-cloth, or similar meshed flexible material connecting said ends, substantially as specified.

138,929.—*Device for Stopping the Spindles of Spinning-Frames.*—HENRY T. POTTER, Norwich, Conn. Application filed February 27, 1873.

The pad is to be borne against by the knee of the operator when it is desired to stop the rotation of the spindle.

Claim.—The combination of a pendent or movable pad with the spindle, substantially as and for the purpose specified.

138,930.—*Stereoscope.*—ANTONIO QUIROLO, New York, N. Y. Application filed February 17, 1873.

The object-frame has laterally-swinging end clips, and is attached to the handle-staff by a pair of adjustable sliding tubes, whose extension is limited by an interior wire bent or knotted at its extremities.

Claim.—1. The wire G containing the hook *f g*, and applied through the tubes D E, to constitute a tension and stop, substantially in the manner set forth.

2. The cross-bar or picture-holder F, combined with the pivoted plates H H which carry the picture clasps I I, substantially as herein set forth.

138,931.—*Wheel-Cultivator.*—JOHN H. RANDOLPH, Jr., Bayou Goula, La. Application filed February 8, 1873.

The axle or shaft of the cultivator-frame revolves with the wheels, carrying a gear-wheel which gears into another wheel and shaft, on which are placed blades similar to those of a propeller, designed to throw the loose earth turned up by the plows among the plants. By a peculiar gearing the plows and the shaft carrying the revolving blades are raised simultaneously by the lever M.

Claim.—1. The combination of the gear-wheels T X, shaft W, and bracket V, with the propeller or screw-blades Y Z A′ and shaft E of the drive-wheel D, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the keeper or long bearing G and loop B′ with the adjustable standard H, shaft E of the drive-wheel D, and bracket V of the propeller-shaft W, substantially as herein shown and described, and for the purpose set forth.

138,932.—*Wrench.*—HENRY F. READ, Brooklyn, N. Y., assignor of one-half his right to EDMUND BEACH, same place. Application filed September 16, 1872.

The movable jaw is adjusted by means of a screw-nut moving on screw-stem, which is attached to a holding device, all of which is movable back and forth on the jaw-bar. When interlocking teeth are relieved, and when the movable jaw is advanced to the desired point, said teeth will be again interlocked by means of spring holding the jaw firmly.

Claim.—1. The thumb-screw nut F, carried by and revolved upon the movable jaw D and screw-stem, in combination with the screw-stem E, carried by and sliding with the holding device G, as and for the purpose described.

2. The thumb-screw nut F, located and arranged between the arms D *d* of the jaw D, and upon the screw-stem as an axis, whereby the nut F is held in position and the jaw D moved over the screw-stem without the turning of the latter, as described.

3. The stop *i* of the movable jaw D, in combination with the shouldered recess *j* in the screw-stem E, to obtain a lock for preventing the separation of the jaw and screw-stem, as described.

4. The T-shaped head *h* of the screw-stem E and the ways of the slot *g*, when arranged to be interlocked through the inner open end of the slot *g*, as described.

5. The combination of the screw thumb-nut F, screw-stem E, holding device G H, interlocking T-head *h*, stop *i*, intermating teeth *a b*, the fixed and movable jaws B D, and the jaw-bar A, constructed and arranged for joint operation as described.

138,933.—*Water-Wheel.*—ALISHA B. REWIFF, Bingham's Mills, N. Y. Application filed April 19, 1873.

This wheel is formed of the body, inner rim, buckets, and outer rim constructed and arranged in connection with each other. There is a scroll or stationary wheel formed of the body, the inner rim, the chutes, and the flanged outer rim in connection with each other; it is made convex upon its upper side. On the inner rim of the scroll are the chutes, the inner edges of which are secured to the inner rim, and to their outer edges is secured the outer rim. The outer rim is made lower than the inner rim.

Claim.—1. The water-wheel formed of the body B, inner rim C, buckets D, and outer rim E, constructed and arranged in connection with each other, substantially as herein shown and described.

2. The scroll or stationary wheel formed of the body F, inner rim G, chutes H, and flanged outer rim I J, constructed and arranged in connection with each other and with the wheel B C D E, substantially as herein shown and described.

3. The gate K L, constructed substantially as herein shown and described, in combination with the scroll or stationary wheel F G H I J, as set forth.

138,934.—*Potato-Digger.*—JOHN D. RENSINK, Bridgeport, N. J. Application filed February 3, 1873.

A potato-digger constructed in the shape of an ordinary sled, provided with knives attached to the runners in front and extending back to the rear. Between the blades at the rear is secured a plow provided with a riddle. About midway and above the knives is secured a forked cutter for cutting off the vines.

Claim.—1. The combination of the cutting-blades B B and forked cutter D, arranged above and behind the blade, as set forth.

2. The combination of the runners B B, sharpened at the edges, forked cutter D, plow F, and riddle *a*, as set forth.

138,935.—*Snap-Hook.*—SAMUEL REYNOLDS, Allegheny, Pa. Application filed 5, 1873.

Improvement upon patent No. 124,628. The improvement consists in casting the journal-seats opposite the end of the hook.

Claim.—The snap-hook, having the journal-seats *c*, cast in the side bars opposite the end of the hook, the spring *k*, and the tumbler *z*, having the journals *s*, the base-flanches *v w*, and the trip-flanch *n*, in contact with the end of the hook, substantially as specified.

138,936.—*Steam-Heater.*—GEORGE B. RIGGINS, New York, N. Y. Application filed March 12, 1873.

The compound nozzle is composed of three pipes, one within the other; the inner is the water-pipe. When the water in the generating-coil is evaporated a suction is produced in the water-pipe, and water then flows forward from the supply-tank without interruption.

Claim.—The combination of a compound nozzle, H, with a supply-tank, C, and a generating-coil, B, substantially in the manner and for the purpose shown and described.

138,937.—*Washing-Machine.*—CLARANCE L. ROSE, Roseville, Ill Application filed April 5, 1873.

The washing-machine is constructed in a half-circular form, with its rubber suspended from the uprights by journals, and from it, at or near its center, is attached a pitman, and to the tub by which motion is given to it by the oscillation of the tub against beaters or a rack attached to it.

Claim.—The combination of the rubber C of the oscillating tub B with the beater, pitman *g*, and frame A, by standards *d* and pivots *f*, to produce motion of beater against rubber, substantially as described.

138,938.—*Separating Gold and Silver from Lead Containing the Same.*—CLEMENT ROSWAG and ALFRED NICOLLE DE PAUVILLE, Paris, France. Application filed January 2, 1873.

The dross is heated on an iron plate at a low temperature, and then pulverized, after which it is introduced, with mercury, into a rotary amalgamating-vessel, where the metals zinc, silver, and lead readily unite with the mercury.

Claim.—1. The employment, in recovering precious metals from lead, of aluminium alone or alloyed with other metals, as set forth.

2. Amalgamating the dross formed in treating the lead with a reacting metal or alloy, substantially as described.

3. The recovery of aluminium from the dross by treating the same with mercury, as set forth.

138,939.—*Chair.*—JOHN K. ROWLEY, Chicago, Ill. Application filed April 17, 1873.

A chair made of willow or other light elastic material, without any bottom or seat or hind legs, so as to be used on the seat of a carriage or any other permanent seat.

Claim.—An invalid-chair, of willow or other light elastic materials, having supporting sides and arms A A, back B, front legs C C, and bar D, substantially as described.

138,940.—*Bolt-Cutter.*—JACOB S. RYDER, Sing Sing, N. Y. Application filed March 29, 1873.

The movable handle is connected to the cutter-bar by a link pivoted eccentrically to the main pivot.

Claim.—The bolt-cutter, consisting of the lever A having the opening *b*, and the arm C extending at right angles, or nearly so, with its main length, the lever E, the cutter-bar D having the curved flange *e* and the link F, substantially as specified.

138,941.—*Apparatus for Freezing Liquids.*—FRANCESCO SAJNO, Milan, Italy. Application filed April 5, 1873.

The outer cylinder, having a non-conducting jacket, is contracted at the ends to receive screw-caps provided with cup-shaped flanges, upon which the cylinder rests in a vertical position when filling or emptying the receptacles. The inner cylinder is permanently attached to the outer at one end. Within the inner cylinder is a stationary rod provided with a scraper to clear the inner surface of the small cylinder. Partitions project into the space between the cylinders to prevent the shifting of the freezing mixture.

Claim.—1. The combination of the horizontally-revolving and outer cylinder A, inner cylinder E, and the caps C D, the said cylinder A and caps being arranged as described, to prevent the water from leaking out.

2. The combination of the cup-shaped flanges O with the caps, in the manner described.

3. The combination of the partition G with the cylinders A and E, substantially as specified.

138,942.—*Potato-Digger.*—LEWIS SCHAFER, Jr., Mount Carmel, Ill. Application filed March 27, 1873.

A potato-digger constructed with a curved beam, to the lower part of which is secured a shovel and sifting-screen. The shovel is made concave longitudinally and transversely. To the rear end of the shovel is secured one end of the sifting-screen, while the other end is supported by a brace from the beam.

Claim.—1. The potato-digger herein described, having the beam A, standard C, concave shovel D, and double-inclined screen E, as set forth.

2. The combination of the screen and handle-braces F and *a a* with the standard C, said braces being secured to the standard by a single bolt, as shown and described.

138,943.—*Pencil-Sharpener.*—ADAM E. SCHATZ, New York, N. Y. Application filed October 21, 1871.

A plate of metal is bent into conical form on one side to form a cutter for the wood, and similarly on the other side to form a cutter for the lead of a pencil.

Claim.—As an article of manufacture, the pencil-sharpener, constructed of a metal blank, bent at one side to form the wood-guide D and sharpener A′, and at the other side to form the lead-sharpener E, substantially as specified.

138,944.—*Sash-Cord Guide.*—WILLIAM SHAW, Brooklyn, N. Y. Application filed March 22, 1873.

A short screw-threaded tubular case has flat surfaces for the hub-bearings on opposite sides of the interior, together with the ordinary shaft and pulley or pulleys. These grooved pulleys have end chambers, in which anti-friction balls are loosely arranged in such manner as to bear directly against the shaft and lessen friction. The ends of the rod or shaft are riveted outside the case, thus closing the end chambers and retaining the balls inside the chambered hubs in working position.

Claim.—The case A having flat surfaces D, in which are journaled the rod or pulley-shaft E, and the rollers or pulleys F having end chambers G G, combined with sets of loose balls placed in said end chambers, as and for the purpose described.

138,945.—*Sinking Pneumatic Piles or Caissons.*—FREDERICK E. SICKELS, Marshall, Tex. Application filed October 15, 1872.

The air-lock is made of smaller diameter than the pile, and is located directly upon the air-chamber. An observation-glass in the floor of the air-lock permits inspection of the workmen in the air-chamber. A check-valve is located in the reservoir to prevent too great pressure in the pumps and irregularity in their action from injuriously affecting the workmen. The bags are provided with a collar for the purpose of completely stopping the pipe through which they are removed, each thus serving the purpose of a valve for its successor. Staves are driven obliquely under the foot of the pile to afford a better support. The guy-chains are carried down by the pile in its descent, and afford anchorage and stays for piles subsequently sunk.

Claim.—1. The combination of the air-lock A, the caisson or pile K, and the air-chamber H, as and for the purpose described and represented.

2. The reservoir F, with a regulating-valve, *f*⁴, interposed between the air-pumps and the chamber H, as and for the purposes described.

3. The guys E, carried down with and held by the pile or caisson being sunk, so as to serve as anchorages for subsequent or contiguous piles or caissons that are to be sunk to steady them in their descent, as described.

4. The staves M, in combination with the pile or caisson, substantially as and for the purpose described.

5. The combination of the pipe B with the bags or buckets C, formed as herein described, to co-operate with the same, for the purpose of removing the excavated matter and keeping said pipe always closed, as described.

6. The observation-glass N, arranged between the air-lock A and the air-chamber H, as and for the purpose described and represented.

138,946.—*Holder for Brushes, Mops, &c.*—ISRAEL SMITH, Rochester, N. Y. Application filed March 6, 1873.

The body of the brush is constructed in ordinary form, with screw attached to the lower end of the handle, passing through a nut with side projections and openings through which is passed wire braces or connections, which, by their ends, are turned inward to clasp the brush, which is firmly held by the handle with the screw and nut against the top of it resting in a countersink, and has a set-screw to hold it in its position for use.

Claim.—The mop or brush holder, consisting of the screw B, cross-head C, and clamping-wires E E, when said screw has a conical point, *a*, to bear direct upon the back of the device to be held, and said clamping-wires are made each of a single piece and looped through double holes of the cross-head, said holder being used either with or without the set-screw *g*, all as herein shown and described.

138,947.—*Expanding Mandrel.*—JAMES D. SMITH, New York, N. Y., assignor to JAMES D. SMITH and HUGH R. GARVIN, same place. Application filed August 1, 1872.

The mandrel, made tapering, has a cylindrical collar, the interior of which corresponds with the shape of the mandrel. Slots terminating in circular holes extend, alternately, from one end of the collar to near the other, to allow the collar to expand when drawn along the mandrel.

Claim.—The expanding tool, constituted by the tapering mandrel-piece and the cylindrical collar, formed with a tapering interior and slotted alternately from either end, the two combined and operating substantially as herein set forth.

138,948.—*Ore-Washer.*—REUBEN SOLLIDAY, Allentown, Pa. Application filed January 23, 1873.

The beaters of ore-washers, which usually wear out in a few days, are made in two parts, a base attached to the revolving cylinder, and a blade which can be replaced at will.

Claim.—The base A and blade B, constructed separately, and combined by means of the dovetailed groove and tenon, substantially as and for the purpose specified.

138,949.—*Supplementary Wheel for Car-Trucks.*—SMITH SPELMAN, Brooklyn, N. Y. Application filed February 21, 1873.

The flangeless independent wheels are adapted to run upon the flat outer rail of the curves in street railways.

Claim.—In a car-truck, the axle B, carrying the fixed wheels C C, in combination with the independent wheels D D, arranged to operate substantially as herein shown, and for the purpose described.

138,950.—*Hoisting and Conveying Apparatus.*—GEORGE STANCLIFF, New York, N. Y. Application filed February 8, 1873.

Truck carrying the weight and moving it back and forth on an inclined track by means of a windlass and rope or chain attached to the truck which operates the apparatus.

Claim.—1. The combination of the slotted arrow *b*, slotted funnel-plate *h i*, having guiding recesses for bolts I and *q*, and having lug *m*, pin *n*, and spring S, with pivoted lever H, projecting plate g^3, weighted arm f^3, and pin g^3, all constructed and arranged as and for the purpose described.

2. The sliding buffer-rods E, with pivoted arms—one with lug b^2, the other with projection A^2—and springs *y*, in connection with tongue-lever H, arm f^3, and pin g^3, and lever *w*, acting on bolts *q* and I, locking and unlocking the same at the points specified, as described.

138,951.—*Machine for Skiving Leather.*—EDWIN B. STIMPSON, New York, N. Y. Application filed April 9, 1873.

A rotary and circular pattern is hung upon a shaft supported in yielding bearings above the cutter, and over a yielding bed, and, as the leather passes underneath the pattern, revolves it, and the leather is depressed in conformity to the outlines of the pattern.

Claim.—1. The rotary pattern F, arranged on a skiving-machine in conjunction with the knife B, substantially as described.

2. The bed C, combined with the adjustable knife B and rotating pattern F of a leather-skiving-machine, substantially as specified.

138,952.—*Tire-Heater.*—FREDERICK STRATTNER, Wilmington, Del. Application filed March 22, 1873.

The case has removable sides and adjustable standards, and the inner pipe, which is perforated or supplied with burners, is connected with supply-pipes through the circumference of the case.

Claim.—A tire-heating apparatus, composed, respectively, of the case A, having the removable sides A′ A′ and adjusting standards C C, and the heating and supply pipes B D, substantially as described and shown.

138,953.—*Soap-Crutching Machine.*—STEPHEN STRUNZ, Birmingham, Pa. Application filed August 2, 1871.

Machine consisting of a barrel-shaped vessel having a dasher of the ordinary construction, and operated by means of a crank.

Claim.—A soap-crutching apparatus, composed of a cylindrical vessel, provided with an opening at the top and an opening at the bottom, and having within the cylindrical vessel a shaft with a series of spirally-arranged flat blades, as described.

138,954.—*Disinfecting Soap-Boiling Establishment.*—STEPHEN STRUNZ, Pittsburg, Pa. Application filed May 8, 1873.

Hoods are connected with the tops of the kettles, and a draft or blast fan forces the gases under the fire of a steam-boiler. The hoods may be raised during the working of the materials in the kettles.

Claim.—1. The combination, with a soap-boiling kettle or kettles, of a hood and flues, provided with one or more valves, and a blast apparatus, so as to take off and deliver to a furnace the gases and vapors, substantially as specified.

2. The method or system herein described for disinfecting soap-boiling establishments, the same consisting in attaching to the kettles collectors for gathering the gases, and combining therewith a blast or draft apparatus, so as to force the gases into or through a fire or furnace, substantially as specified.

138,955.—*Hay-Carrier.*—EUGENE B. TANNER, Attica, Ohio. Application filed April 12, 1873.

The lever is pivoted with its lower end to beam of the barn; near its upper end it is guided by a fulcrum or bar secured by braces to the rafters, and connected with a tackle block, which has a weighted pawl for suspending the load till ready to drop the same.

Claim.—1. The combination of pivoted lever C and guide-bar B, supported by bars *a*, with tackle-block D, rope E, and pulleys *d*, *d*¹, and *d*², for hoisting and conveying the hay, as described.

2. Tackle-block D, having pulley *d*, pin *g*, and weighted lever F, in combination with rope E, having ferrule *f* to lock the load to the block, as set forth.

3. The combination of lever C and weighted lever F with rope K, to disconnect rope E and fork G at the starting-point, substantially as described.

4. The combination of lever C and fork G with rope H, pendent arm I, and pulley *d*² for releasing the load and returning lever to starting-point, as described.

138,956.—*Fire and Water-Proof Composition for Ceilings, Walls, and Floors.*—LUCIEN A. TANTIERE, New York, N. Y. Application filed filed March 25, 1873.

Claim.—The compound composed of plaster of Paris and the hydraulic lime of Teil, with coke-dust or other suitable material, substantially in the proportions and for the purposes set forth.

138,957.—*Feed-Water Heater for Steam-Boilers.*—SIDNEY T. TAYLOR, Baltimore, Md. Application filed February 21.

A cone is arranged under the induction exhaust-steam pipe or tubes to spread the steam in a thin annular sheet. Under the cone is arranged an annular perforated cold-water pipe, by which the steam is condensed as it comes in contact with the sprays of water. In the bottom of the case is arranged a vertical well, provided with a perforated piston and valve for the withdrawal of the water.

Claim.—1. The induction and eduction steam tubes B G, annular perforated water-discharge tube F, and the cone C, combined as herein described, whereby the annular sheets of steam and water are caused to intersect, as specified.

2. The vertical well or cylinder attached to the bottom of the case A, and provided with the perforated piston H and valve h, as shown and described, for the purpose specified.

138,958.—*Device for Heading Bolts.*—WILLIAM M. THOROUGHGOOD, Salisbury, Md. Application filed March 15, 1873.

The tool at its end is, in cross-section, of the same shape and size as the head to be formed on the bolt, and has, in a slot through its center, a pivoted lever to force the bolt.

Claim.—1. A hand-tool for heading bolts, spikes, and nails, formed of a rod or bar recessed or bored at its end to receive the body or shank of the article to be made, and of an external shape and size at the extremity of said end on its sides to correspond with the size and shape of the head to be formed, substantially as specified.

2. The combination of an ejector with the rod or bar of the hand-tool constructed to receive within its end the shank or body of the article to be made and shaped externally on the sides of said end at its extremity to correspond with the head to be formed, essentially as described.

138,959.—*Rock-Drill Carriage.*—GEORGE E. TOWNE and WILLIAM W. BAILEY, Fitchburg, Mass., assignors to BURLEIGH ROCK-DRILL COMPANY, same place. Application filed February 7, 1873.

Claim.—A drill carriage having, in combination with an open frame, the pivoted drill-bar carrier, arranged to operate substantially as described.

138,960.—*Molder's Flask.*—CHARLES TRUESDALE, Cincinnati, Ohio. Application filed March 8, 1873.

An eccentric acts upon the pintle of the hinge and raises the cope vertically and secures a clean lift of the sand without the use of wedges.

Claim.—1. A hinge for molders' flasks, consisting of two separable members, one of which has pivoted within it an eccentric that is adapted to operate against the pintle of the other member, substantially as herein described, and for the purpose stated.

2. The combination of the plate D, cheeks E E', pivoted eccentric F *f* G, studs H H', interval I, plate K, cheeks L L', pintle M, and flanges *s s'*, as and for the purpose described.

138,961.—*Game-Table.*—FERDINAND UEBEL, Cedar Rapids, Iowa. Application filed February 5, 1873.

The table has a deep rim about its edge, and across it a treble gateway. At the further end is a skeleton cage, in which and about the table-bed numerous pins are placed. The pins are to be knocked over by a spinning top set in motion at the slotted head of the table, and are variously numbered in the order of accessibility.

Claim.—1. An oblong table, rounded at one end, having its head-piece O at right angles to sides, and having an upwardly-projecting flange there-around, to adapt it for the use specified.

2. The arch C, having three openings, D, the corner-arches E E at rear of table, having openings of the same size; and the castle F, having six pillars with equal and similar openings, all arranged as described, on a floor having the notated stars X Y Z, and within the flange of table, as and for the purpose described.

3. The wooden collar at the foot of slot, and the metallic collar P, applied together to the head-piece having slot *m*, and in connection with the flanged table, as described, to enable the top to be conveniently operated.

138,962.—*Rudder for Vessels.*—JOHN W. VANBANT, Le Claire, Iowa. Application filed September 13, 1872.

A balance-rudder has on its forward end a hinged portion, which may extend beyond the rudder or be withdrawn into it at pleasure. The forward extremity of the hinged portion has a projecting metallic lip, which fits into a curved groove or guide-way fastened securely to the under and after part of the run of the boat, and the rudder is thus guided in this groove, follows the curve of the run, and prevents passage of water between the forward end of the rudder and the boat.

Claim.—1. The movable section B, when combined to operate with the rudder, as specified and set forth.

2. The arrangement of the metallic ways A, in combination with the movable section B, for the purpose set forth and specified.

138,963.—*Combined Stop-Cock and Check-Valve.*—ASA T. WALDRON, Waterford, N. Y. Application filed January 25, 1873.

A common stop-cock, having a hollow socket with a valve-seat and hollow plug within it, in which there is a spring holding the valve to it, and may be used for stop-cock or check-valve.

Claim.—The plug A, having partition, water-passage, and valve-seat, the spring G, valve F, and the socket H, constructed, arranged, and applied together in the shell, as and for the purpose set forth.

138,964.—*Cultivator.*—WILLIAM T. WALKER, Fonteney Mills, Ga. Application filed March 22, 1873.

The side beams are pivoted at the center in such manner that the plowman by the handles can increase or diminish the width of the space cultivated while the machine is in motion. Springs attached rigidly to the center beam serve to restore the frame to its usual shape.

Claim.—The springs H H secured to the fixed central beam A, and connected at their free ends with the pivoted and handled side beams C C by means of staples or other equivalent guides, as shown and described, to operate as specified.

138,965.—*Electrical Burglar-Alarm.*—HORACE E. WALTER, Richfield Springs, N. Y. Application filed December 10, 1872.

A peculiar arrangement of latch and stop mechanism, in connection with an alarm-clock, is under the control of an electro-magnet, so that on the interruption of the electrical circuit by the burglarious opening of a door or window in suitable connection the armature is released by gravity and the alarm is sounded. A stop operated by the clock prevents the alarm being sounded after a given hour in the morning.

Claim.—1. The weighted armature *a* and electro-magnet *g*, in combination with the hook *c*, latch-plate *c*, and stop *d*, to the alarm-clock movement, substantially as set forth.

2. The slide 6, arm 7, link 8, and lifter 9, in combination with the latch *c c*, stop *d*, electro-magnet, and alarm-clock mechanism, substantially as set forth.

3. The springs *l l* upon the removable back *m* that supports the clock-movement, electro-magnet, and alarm mechanism, in combination with the circuit-stops 2 upon the case *a*, as and for the purposes set forth.

4. The pin 10 upon the clock-movement, and the slide-rod 11, in combination with the latch *c*, latch-plate *c*, electro-magnet *g*, and stop *d*, as and for the purposes set forth.

138,966.—*Rolling Wire.*—WILLIAM WALTON and JOHN T. FALLOWS, Haughton Dale Mills, Denton, near Manchester, England. Application filed February 27, 1873.

Reducing wires to angular forms by passing two wires together through an angular groove in a pair of rolls.

Claim.—The method of forming two wires simultaneously by passing them between grooved rolls, in the manner described.

138,967.—*Printer's Chase.*—EDMOND A. WARREN, Brooklyn, N. Y. Application filed April 17, 1873.

The wedge-shaped side and end quoins are driven by screws projecting through the chase and working in nuts bearing on the inner side of the chase.

Claim.—The combination of the wedges or quoins C C and the screws E E, working in tapped holes therein, and turning, but confined longitudinally in, the chase, substantially as and for the purpose herein set forth.

138,968.—*Railroad-Car Brake-Wheel.*—CHARLES A. WATERBURY, New York, N. Y. Application filed April 9, 1873.

The rim of the wheel is of peculiar form, that the brakeman may have a firm hold as he is tightening the brakes.

Claim.—A brake handle or wheel made with alternately vertical and horizontal undulations, substantially as and for the purpose herein shown and described.

138,969.—*Washing-Machine.*—PETER B. WATSON, Belvidere, N. J., assignor of two-thirds his right to THOMAS WEST, same place. Application filed March 22, 1873.

A washing-machine constructed with its center roll, with alternate ribs of rubber and zinc resting upon a spring-bed of rolls in ordinary form.

Claim.—The washing-roller having alternate zinc-covered ribs *k* and soft rubber puffs *l*, substantially as specified.

138,970.—*Washing-Machine.*—VOLNEY WHITE, Corry, Pa. Application filed April 4, 1873.

In a wash-tub is arranged a corrugated rubber resting on spiral springs. Above this is journaled, on the edges of the tub, a close hollow cylinder, on the face of which is a groove, in which is a rod held in place by yielding loops or staples.

Claim.—The combination of the close hollow cylinder C, having the removable rod E mounted in a groove in its face, and secured thereto by the yielding loops or staples, as described, with the corrugated spring concave B located centrally of the tub, and underneath the cylinder C, all constructed, arranged, and operating in the manner and for the purpose described.

138,971.—*Bed-Bottom.*—NELSON O. WILCOX, Omaha, Neb. Application filed April 19, 1873.

Lever spring-slats are placed at the sides, upon the ends of which are cross-bars notched to hold the longitudinal slats.

Claim.—The arrangement and combination of the spring-slats C, middle slats D, and cross-piece E, as and for the purposes described.

138,972.—*Row-Lock.*—GEORGE C. WILEN, Philadelphia, Pa. Application filed March 22, 1873.

Bail or hinged bearing, to be turned into the boat out of the way, forms, in connection with the plate B, the socket for the row-lock.

Claim.—The socket-plate B and bail C, combined with the row-lock of a boat, as and for the purposes described.

138,973.—*Stock for Drill or other Bits.*—HARRY B. WILLIAMS, Cincinnati, Ohio, assignor to himself, ALBERT G. CORER, LYMAN L. BENSON, and JOHN B. SCHRODER, same place. Application filed February 3, 1873.

The frame of the apparatus is adapted to clamp a railroad rail, and also to support a stock, which can be used as a wrench or for holding a drill to be used for drilling holes in the webs of railroad rails.

Claim.—1. The combination of the flanged bed or clamp-bar A C C' having the lips B B' and the sliding jaw D, wedge *d*, nut *e*, and lug E, and feed-screw F G having the recessed point *f*, substantially as shown and described.

2. In combination with the above, the reversible convertible drill and wrench, consisting of the parts h I *i* J L M *m* N O O' *o* P P' Q *q q'* R H, constructed, arranged, and operating substantially as shown and described.

138,974.—*Wash-Boiler Attachment.*—HENRY W. WILLIAMS, Grinnell, Iowa. Application filed October 5, 1872.

A metallic plate of the form to fit in a wash-boiler, with a large oval opening in the center, across which extend bars, and below these bars a short distance a close plate is supported on triangular partitions.

Claim.—The wash-boiler attachment herein described, having plates A and D connected, as described, together with the aperture B, guards C, and supporting partitions D', constructed and arranged substantially as and for the purpose specified.

138,975.—*Bush-Hammer.*—EDWARD J. WORCESTER, Worcester, Mass. Application filed March 1, 1873.

Claim.—In the manufacture of bush-hammers, a bar formed by rolling and planing, from which the hammer sections may be cut, substantially as shown and described.

138,976.—*Sieve.*—GEORGE WRIGHT, Savannah, Mo. Application filed January 11, 1873.

The free ends of the wire bottom are secured together and in the groove by solder.

Claim.—The sieve A, constructed with groove *b* to receive the sieve-bottom, the free ends of the wire being secured together and to the vessel by solder, as described and shown.

138,977.—*Step-Ladder.*—SAMUEL WRIGHT, Hillsborough, Mo. Application filed March 11, 1873.

The legs are connected below by a cross-bar, but move independently, rotating slightly on their own axes. The object is to allow of their being placed so as to stand firmly on uneven ground.

Claim.—A step-ladder, having its legs or braces secured to it by means of joints, so as to allow each leg a limited, free, and independent movement, substantially as set forth.

REISSUE PATENTS.

5,401.—*Machine for Forming Building-Blocks.*—JOSIAH S. ELLIOTT, Chelsea, Mass., assignor to UNION STONE COMPANY.—Patent No. 111,921, dated February 21, 1871. Application filed December 24, 1872.

The hopper being filled, the machine is set in motion. The feeder is carried under the ram. The bottom of the feeder withdrawn, the ram strikes a blow through the material, carrying it into a mold and partially condensing it. The blow is repeated and the ram raised for a third blow. The feeder is carried back under the hopper to its original position, when a third blow is given by the ram, which is then raised, the cone withdrawn downward. The mold is pressed upward against the face of the ram, which pushes out the molded article upon the table.

Claim.—1. The machine herein shown and described for manufacturing artificial stone, consisting of the ram B, mold C, feeder B', core *w*, and off-bearing table A, constructed, combined, and operating as set forth.

2. The combination, herein shown, of the ram B, reciprocating feeder B', movable mold C, and off-bearing table A, with their connecting and operating mechanism, as herein set forth.

3. The combination and arrangement of the mold C, shaft *d*, cams W, and their connections, as herein shown and described.

4. The arrangement of cams W and X, shaft *d*, and core *w*, with their connections, as herein shown and described.

5. The combination of the lever *e* and the pivots *u* and *t*, with the table A and the scraper *v*, as and for the purposes described.

6. In an artificial-stone machine, the combination, with the ram, of a cam acting directly thereon to lift and release the same, as herein substantially described.

5,402.—*Razor-Strop.*—OLIVER B. HOWARD, Deering, assignor of one-half interest to OLIVER P. SHEPHERD, Portland, Me.—Patent No. 117,421, dated July 25, 1871. Application filed April 3, 1873.

Claim.—1. A band of leather provided with a thin elastic, but non-extensible, base of metal cemented thereto, to be used in a razor-strop, in the manner substantially as shown.

2. The combination of the band *a*, constructed as described—that is, having a non-extensible base cemented thereto, with the handle *b*, rod *c*, and end piece *d*, in the manner and for the purposes substantially as shown.

5,403.—*Button-Fastening.*—EDWIN F. LEE, Bayonne, N. J., assignor of one-third interest to JOSEPH WERNHOLD, New York city.—Patent No. 109,134, dated November 8, 1870. Application filed March 27, 1873.

A metallic disk has a tongue struck up from one side. The tongue has an enlarged end, which, after being passed through the cloth and the eye of the button, is secured in a slot on the opposite side of the disk.

Claim.—A button-fastening composed of a disk, A, and tongue B, made in one piece, said tongue having an enlargement at its free end to fit a recess in the disk, for operation substantially as described.

5,404.—*Cotton-Bale Tie.*—JAMES R. MCCLINTOCK, Mobile, Ala., for himself, and as the legal representative of JOHN CUMBERLAND, deceased, assignor, by mesne assignments, to ANDREW J. AIKEN, New Orleans, La.—Patent No. 115,235, dated May 23, 1871. Application filed April 21, 1873.

Claim.—The buckle A provided with a central opening or slot, B, when the same is used for fastening the ends of metallic bands together around cotton-bales, in the manner substantially as herein described.

5,405.—*Stove-Door.*—DAVID N. MARTIN, Lawrence, Mass., assignor to D. N. and C. M. MARTIN.—Patent No. 116,334, dated June 27, 1871. Application filed June 20, 1872.

A rim or facing of brass or other non-conducting metal is placed on the inner side of the draft-door and on the edge of the opening in the stove or furnace, against which it shuts.

Claim.—A door, valve, slides, or other device for affording an opening below the grate of a stove or furnace when faced around the edge with brass or other non-corrosive metal, as above described, so that the said metal may close tightly against a similar facing upon the stove or furnace, for the purposes hereinbefore set forth.

5,406.—*Railway Oil-Car.*—SAMUEL W. MURRAY and BENJAMIN P. LAMASON, Milton, Pa.—Patent No. 100,056, dated February 22, 1870. Application filed December 26, 1872.

Through metallic tubes, which are connected to the car-stringers by means of brackets, extend tie-rods, which are secured to the end beams. A hand-rail surrounds the car, the posts by which the rail is supported being secured to the brackets. The car-body and truck are prevented from being laterally displaced by means of flanged bearing-plates on the car-body and truck-bolster and a king-bolt having a collar at its center, which is held between the plates.

Claim.—1. The combination, with the main frame of the car-body, of the brackets I, lateral tubes K, and the rods L, constructed and arranged substantially as and for the purpose set forth.

2. In combination with the brackets I, the posts O and hand-rail J, substantially as and for the purpose set forth.

3. In combination with the flanged center plates L K of the body of the car and the bolster of the truck, the king-bolt Q having a collar, R, substantially as described, for the object specified.

4. The combination, with the lateral tubes K and floor M, of the hooked bolts P, as and for the purpose set forth.

5. The man-hole cover X of a railroad oil-car, having a dovetailed groove for the reception of a packing-strip, V, as set forth.

5,407.—*Water-Wheel.*—JAMES P. COLLINS, Norwich, Conn.—Patent No. 26,339, dated December 6, 1859; reissue No. 979, dated June 12, 1860. Application filed June 16, 1871.

A number of buckets with central covering box or cap, in combination with central disk or lifting-plate, for counteracting the weight of water on the buckets. A flange or ring is placed between the stationary guide and the wheel for preventing the ingress of the water to and its consequent pressure upon the center of the wheel. There is also a packing-ring fitted within a recess or groove surrounding the wheel, and adapted to move laterally to compensate for wear or irregularities in the movement of the wheel.

Claim.—1. A water-wheel provided with annularly-arranged buckets and a central covering box or cap, in combination with a disk or lifting plate for relieving or counteracting the weight or pressure of the water on the buckets, substantially as described.

2. The ring or flange *n* interposed between the stationary guide and the wheel for preventing access of the water to, and its consequent pressure upon, the center of the wheel, substantially as and for the purpose specified.

3. The combination, with a water-wheel provided with annularly-arranged buckets, as described, of a lifting-plate for counteracting the weight of the water on the buckets, and a ring or flange interposed between the wheel and the stationary guide-box or cap for preventing the ingress of water between said wheel and guide-box or cap, as described.

4. The packing-ring *i* fitted within a recess or groove surrounding the wheel, and adapted to move laterally to compensate for wear or irregularities in the movement of the wheel, as described.

5,408.—*Machine for Graduating Carpenters' Squares.*—HORACE K. JONES, Kensington, Conn., assignor to THE HART, BLIVEN AND MEAD MANUFACTURING COMPANY, (formerly known as THE HART MANUFACTURING COMPANY.)—Patent No. 93,449, dated August 10, 1869. Application filed February 25, 1873.

The square to be marked is held by a clamping device at the lower part of the machine, and the cutters or gravers, arranged in suitable series, are mounted on horizontal bars carried by two revolving vertical disks supporting their extremities, and are controlled by cams and springs in such manner as to bring them into action and vary the lengths of their cuts as desired.

Claim.—1. The combination of the cams G and bars F with the tool-holders H and tools I, when the parts are constructed and arranged substantially as herein described.

2. The combination of the bars F, spring *s*, tool-holder H, and gage K, all constructed and arranged substantially as described.

3. The construction of the tool and socket so that the edge of the tool fits into a V-shaped recess, the angle of which is in line with the working-point of the tool, substantially as and for the purpose herein described.

4. The arrangement of the several sets of tool-holders and tools upon the successive bars F in the manner described, so that only one line is cut by the same graver, and the several lines of graduation are cut by successive tools at certain distance to the right or left, substantially as herein described.

5. In a machine for cutting graduations on squares, &c., the combination of the gravers I and their holders H with cams G and springs *d*, for throwing the gravers out of action at predetermined periods of time during the stroke of the same to cut graduation-marks of varying lengths, substantially as described.

6. The clamping device for holding squares of varying tapers to be graduated, consisting of the fixed jaw P, the rocking adjustable jaw M, and the cam N, in combination, substantially as described.

5,409.—*Machine for Bending Tires.*—JOSEPH TOMLINSON, Onslow, Iowa.—Patent No. 135,498, dated February 4, 1873. Application filed April 26, 1873.

Two posts, movable vertically by a screw, support the axle of the upper roll E, and hinged on this axle are two pairs of cheeks which support, respectively, the two rolls D, and also small adjustable side rolls. The cheeks rest on rails on the base-plate, and it results that by elevating the posts, cheeks, &c., the rolls D will be brought nearer together, while a contrary movement will produce a contrary effect. The three rolls are connected by gearing at both ends, and are driven by pinions on a supplementary shaft.

Claim.—1. The tire-bender composed of the hinged cheek-pieces B B, adjustable rollers D D, and movable roller E, all arranged in respect to each other as herein shown and described.

2. The subject-matter of the foregoing clause, in combination with the movable posts *b b* and screw *f*, for adjusting the instrument to produce circles of suitable size, as specified.

3. The laterally-adjustable rollers *g g*, arranged in the hinged cheek-pieces B B of a tire-bender, substantially as herein shown and described.

4. The shaft e^2, pinions b^2, straps d^2, collar e^3, and set-screw f^2, combined and arranged with the posts *b*, wheels *i*, and pin *d*, substantially as specified.

5,410.—*Curing and Packing Meats.*—ISAAC ATKINSON, Hamilton, Canada.—Patent No. 134,965, dated January 21, 1873. Application filed May 3, 1873.

Claim.—The process herein described for curing and packing meat, the same consisting in rolling the meat or meats in fine alum after being salted and washed, and packing with a sheet of paper or analogous material between or around each piece to prevent injurious contact, substantially as and for the purpose specified.

5,411.—*Buckle.*—JOHN A. MASHMEYER, Beardstown, Ill., assignor to SAMUEL S. SARGEANT, Newark, N. J.—Patent No. 77,064, dated April 21, 1868. Application filed December 5, 1872.

Claim.—1. In a harness or other buckle composed of a frame, a bail or bow, and a tongue, the arrangement, as described, of the bail or bow B in combination with the frame A to both slide therein and loop around the trace or strap over an opening in the said frame, substantially as herein specified.

2. A harness or other buckle composed of a frame, A, and a bail or bow, B, sliding therein, and having a tongue on the crossbar *a* that draws or presses on the trace or strap over an opening in the frame, substantially as herein specified.

3. In a harness or other buckle composed of an open frame and a bail or bow sliding in the same, the outward lateral projections on the bail or bow to prevent its sliding through the frame, substantially as herein specified.

INDEX OF INVENTIONS PATENTED MAY 13, 1873.

[The numbers in parentheses denote the classification of patents.]

Alarm, electrical burglar, (24,) H. E. Walter 138,965
Augers, operating earth, (51,) J. B. Christian 138,788
Awnings, painting striped, (56,) C. E. Wheeler 138,773
Axle and axle boxes for vehicles, (31,) F. Hunsinger 138,890
Bag holder, (37,) Hunter and Clayton 138,752
Bale tie, cotton, (7,) McClintock and Cumberland, (reissue) 5,404
Barrels, &c., apparatus for steaming, (19,) A. K. Lee 138,810
Basket form, (109,) A. F. Scow 138,765
Bed bottom, (62,) N. O. Wilcox 138,971
Bedstead, (62,) H. D. Olds 138,756
Bedstead, folding, (62,) Bayles, Carroll, and Miner 138,840
Bedstead, sofa, (62,) C. Rossow 138,819
Belt lacing tool, (23,) F. N. Du Bois 138,740
Billiard table, (143,) G. Buntin 138,850
Blind, inside, (62,) W. Potter, Jr 138,761
Blocks, machine for forming building, (153,) J. S. Elliott, (reissue) 5,401
Bobbins, machine for pointing the journals of, (172,) D. M. Church 138,789
Boiler attachment, wash, (136) H. W. Williams 138,974
Boiler, wash, (136,) Covey and Slafter 138,738
Boiler, wash, (136,) J. Cramer 138,739
Boilers, feed water heater for steam, (148,) S. T. Taylor 138,957
Boilers, water gage and feed indicator for steam, (148,) A. S. Goodrich 138,882
Bolt cutter, (100,) J. S. Ryder 138,940
Bolt heading device, (14,) W. M. Thoroughgood 138,958
Boots, &c., channel opener, (16,) F. Gussetti 138,883
Boots, &c., shank for, (16,) F. P. Buren 138,851
Boring machine, (173,) H. Pitcher 138,927
Bottles, cork for, (1,) I. B. Sampson 138,820
Box and cooler, resin, (155,) A. K. Lee 138,809
Box, work, (38,) E. Heath 138,886
Brick machine, (20,) G. C. Bovey 138,731
Brick machine, (20,) H. Martin 138,754
Bricklayer's pointer, (4,) J. S. Merriken 138,911
Bridle, safety, (72,) Elder and Bishop 138,872
Brush, paint, (22,) G. H. Chinnock 138,787
Brushes, mops, &c., holder for, (22,) I. Smith 138,946
Buckle, (23,) J. A. Mashmeyer, (reissue) 5,411
Burner, Argand gas, (64,) T. Clough 138,858
Burner, vapor, (96,) F. G. Palmer 138,923
Butter paddle, (45,) D. L. Grover 138,900
Button and stud attachment, (23,) H. Freeman 138,745
Button fastening, (22,) E. F. Lee, (reissue) 5,403
Car axle box, (122,) W. W. Crane 138,794
Car brake wheel, railroad, (122,) C. A. Waterbury 138,968
Car coupling, (122,) M. Goolaven 138,748
Car coupling, (122,) H. Millard 138,912
Car, railway oil, (121,) Murray and Lamason, (reissue) 5,406
Car seat, railway, (121,) R. J. La Mothe 138,899
Car spring, (122,) E. Myers 138,920
Car starter, (122,) S. R. and A. C. Bradley 138,848
Car trucks, supplementary wheel for, (122,) S. Spelman 138,949
Car wheel, (122,) F. A. Fouts 138,798
Cars, applying steam power to street railway, (121,) W. W. Crane 138,793
Carriage axle iron, (31,) S. J. Dennis 138,795
Carriage, child's, (31,) T. Galt 138,746
Carriage curtain fastening, (31,) J. H. Gleason 138,799
Carriages, shaft iron for, (31,) W. W. Knowles 138,753
Cart, self-loading, (31,) R. B. Cantrell 138,854
Cartridge box, (32,) T. F. Brabson 138,847
Ceilings, &c., fire and water proof composition for, (4,) L. A. Tartiere 138,956
Cement, manufacture of, (153,) J. E. Park 138,924
Cement, manufacture of artificial hydraulic, (153,) W. B. Tucker 138,770
Cement, rubber, (84,) W. Mosher 138,917
Chair, (62,) J. K. Rowley 138,939
Chair, folding, (62,) G. Hunzinger 138,892
Chairs, spring for rocking, (62,) A. H. Ordway 138,757
Cheese cutter, (88,) J. Locke 138,903
Churn, reciprocating, (45,) G. M. Heim 138,888
Clothes line reel, (91,) J. Brizee 138,785
Clothes wringer, (91,) C. E. Haynes 138,803
Cock and check valve, combined stop, (146,) A. T. Waldron 138,963
Coffin handle, (39,) C. Strong 138,768
Collar, paper, (109,) C. A. Brown 138,849
Column, metallic, (21,) J. L. Piper 138,817
Converters, compound for lining bottoms of Bessemer or Kelly, (85,) J. E. Atwood 138,780
Cooking vessel, (154,) L. P. and J. S. Bodkin 138,846
Copy holder, (146,) French and Chase 138,877
Core, sectional, (33,) W. A. Butler 138,853
Cotton lint room, revolving, (41,) W. T. Crenshaw 138,865
Crane, (79,) F. Farrel 138,876
Cultivator, (43,) D. C. Baker 138,838
Cultivator, (43,) W. T. Walker 138,964
Cultivator, wheel, (43,) J. H. Randolph, Jr 138,931
Curtain cord fastener, (62,) C. Gammel 138,878
Curtain roller, window, (62,) W. W. Grier 138,749
Dental chairs, stool for, (62,) Downs and Morris 138,796
Digger, potato, (73,) J. D. Rensink 138,934
Digger, potato, (73,) L. Schafer, Jr 138,942
Drawing board, (54,) Keuffel and Esser 138,896
Drill carriage, rock, (194,) Towne and Bailey 138,959
Drill or other bits, stock for, (106,) H. B. Williams 138,973
Drilling machine, rock, (124,) D. V. Wood 138,777
Ear protector, (38,) M. Isidor 138,894
Electro magnetic motor, (50,) S. C. Carter 138,855
Engine, rotary, (158,) M. Ellenecser 138,744
Engine, rotary steam, (150,) W. Cram 138,864
Engines, balanced valve for steam, (152,) A. Henry 138,804
Engines, rotary valve for steam, (152,) G. Westinghouse, Jr 138,828
Engines, supplementary heater for steam fire, (118,) Gilbert and Topham 138,880
Explosive compound, (71,) T. S. Beach 138,841
Fan, automatic, (165,) E. Duffner 138,741
Fare box, (42,) H. Baranger 138,839
Fence, portable, (52,) L. Gates 138,747
Fence, wire, (52,) H. M. Rose 138,763

Filing papers, safety hook for, (146,) L. H. Beckwith 138,782
Fire and water proof composition for ceilings, &c., (4,) L. A. Tartiere 138,956
Fire arm, breech loading, (18,) J. Aston 138,837
Fire arm, breech loading, (18,) J. S. Heath 138,887
Fire arms, powder and shot charger for, (55,) A. Hall 138,751
Fire fender, grate, and andiron, combined adjustable, (154,) W. N. Hall 138,885
Fire kindler, (154,) A. Bushnell 138,852
Fire proof roofing, (126,) C. Parker 138,813
Flask, molder's, (33,) C. Truesdale 138,960
Folder, binding, (134,) E. P. West 138,772
Furnace, steam boiler, (148,) M. A. Foster 138,875
Game table, (143,) F. Uebel 138,961
Gas fixture, (64,) G. G. Sheldon 138,706
Gas, water, &c., machine for making laminated pipe for, (64,) J. S. Patrie 138,814
Gate, farm, (52,) H. W. Mullennex 138,918
Generator, fountain, &c., carbonic acid, (66,) J. Matthews 138,906
Generator, gas, (27,) J. S. Wood 138,778
Generator, sectional steam, (148,) W. W. Crane 138,791
Generator, sectional steam, (148,) W. W. Crane 138,792
Generator, sectional steam, (148,) M. T. Davidson 138,866
Gold and silver from lead containing the same, separating, (3,) Roswag and De Pauville 138,938
Governor or draft regulator, heat, (154,) F. E. Chatard, Jr. 138,736
Hammer, bush, (153,) E. J. Worcester 138,975
Harrow and seeder combined, (73,) L. G. Jackson 138,806
Harvester, (74,) J. D. Wilber 138,630
Harvester, clover, (75,) D. B. Bruton 138,786
Harvester knives, machine for sharpening, (74,) J. S. Elliott 138,743
Harvesters, binder's attachment for, (74,) T. Webb 138,771
Hat press, (76,) R. Eickemeyer 138,871
Hay carrier, (79,) E. B. Tanner 138,955
Heater, fire, (60,) F. Strattner 138,952
Heater for steam boilers, feed water, (148,) S. T., Taylor. 138,957
Heater for steam fire engines, supplementary, (118,) Gilbert and Topham 138,880
Heator, steam, (147,) G. B. Riggins 138,936
Hoisting and conveying apparatus, (79,) O. T. McIntosh 138,910
Hoisting and conveying apparatus, (79,) G. Stancliff 138,950
Hoisting whim, (79,) J. C. Marshall 138,811
Hook, snap, (23,) S. Reynolds 138,935
Horse power, (159,) W. P. Emerson 138,873
Hose, hydraulic, (81,) L. R. Blake 138,845
Hose, hydraulic, (81,) L. H. Downing 138,867
Hubs, machine for boring, (173,) J. Eisenmann 138,742
Jelly glasses, lid for, (88,) J. Adams 138,833
Jelly glasses, lid for, (88,) D. Challinor 136,735
Journal box, (87,) J. R. Morris 138,916
Kiln, brick, (20,) A. W. M. Maass 138,905
Knobs, manufacture of door, (93,) J. Ottner 138,758
Ladder, step, (30,) S. Wright 138,977
Lamp, (90,) C. Mayer 138,812
Lamp, candle, (90,) J. A. Pease 138,925
Lantern, (90, G. B. Ishan 138,805
Latch, reversible, (93,) W. T. Munger 138,919
Latches, handle plate for door, (93,) F. Corbin 138,862
Leather dressing machine, (92,) J. A. Enos 138,874
Leather skiving machine, (72,) E. B. Stimpson 138,951
Liquids, apparatus for freezing, (58,) F. Sajuo 138,941
Liquors, apparatus for improving, (19,) Wolters and Rudiger 138,776
Lock cutting machine, (40,) I. L. Penney 138,815
Loom stop mechanism, (95,) Isherwood and Nuttall 138,893
Mandrel, expanding, (100,) J. D. Smith 138,947
Marine safe, (138,) G. F. Abraham 138,832
Meats, curing and packing, (58,) I. Atkinson, (reissue) 5,410
Medical compound, (98,) D. Parlow 138,759
Metallic molds, casting, (33,) J. Williams 138,775
Motion for drawing frames, stop, (142,) A. I. Earle 138,868
Motor, (67,) M. Comstock 138,737
Nails, machine for assorting, (103,) B. Bevelander 138,783
Paddle wheel, (139,) J. C. Chaffee 138,856
Paddle wheels, feathering, (139,) A. Lefebvre 138,900
Painting or coating broom handles, &c., apparatus for, (107,) S. A. Shepard 138,767
Paper bag machine, (109,) L. D. Benner 138,844
Pencil sharpener, (46,) A. E. Schatz 138,943
Piano pedal attachment, (112,) G. C. A. Claes 138,857
Picture frame, (54,) H. S. Hale 138,884
Piles or caissons, sinking pneumatic, (82,) F. E. Sickels 138,945
Pipe or car coupling, (122,) A. G. Story 138,822
Pipe tips, machine for milling, (100,) A. R. Weiss 138,825
Planter, hand corn, (114,) J. Preston 138,818
Plow, (114,) Jackson and Childe 138,895
Plumb bob, (157,) G. B. Cowles 138,790
Pottery stock, machine for preparing, 20,) S. R. Thompson 138,824
Press, glass, (68,) J. Haley 138,750
Press, hay and cotton, (7,) W. H. McBurney 136,909
Printer's chase, (117,) E. A. Warren 138,967
Projectile, compound explosive, (105,) F. A. Markley 138,907
Railroad frog, (120,) W. B. Atkinson 138,835
Railroad switch, (120,) J. R. Adams 138,834
Railway snow plow, (122,) J. W. Arnold 138,833
Razor strop, (44,) O. B. Howard, reissue) 5,402
Reflector, (90,) J. O. Belknap 138,843
Rocker for chairs, attachable, (62,) P. J. and J. H. Welsh 138,826
Row lock, (13,) G. C. Wilen 138,972
Rudder, boom and raft, (13,) L. W. Pond 138,760
Rudder for vessels, (137,) J. W. Van Sant 138,962
Sash cord guide, (24,) W. Shaw 138,944
Sash, window, (30,) W. L. McDowell 138,755
Sash, window, (30,) D. W. Noyes 138,921
Sawdust for use in the arts, preparing, (54,) F. H. Snyder 138,881
Sawing machine, scroll, (130,) H. Lawrence 138,908
Screw, wood, (171,) W. Bourn 138,784
Settee, extension, (62,) C. Beatty 136,842
Sewing machine, (134,) Koch and Brase 138,898
Sewing machine, (134,) Lewis and Scothill 138,902
Sewing machine brake, (134,) R. Gladney 138,881
Sewing machine brake, (134,) C. E. Kimball 138,897
Sewing machine lamp bracket, (134,) L. M. N. Wolf 138,831
Sewing machine, shoe, (134,) Ross and Miller 138,764
Sewing machine tucking attachment, (134,) E. Bouillon 138,730
Shank lacter, (16,) R. B. Perkins 138,926
Shoe fastener, (16,) J. Coykendall 138,862
Shutter worker, (31,) A. H. Gibbs 138,879
Sieve, (170,) G. Wright 138,976
Sieve, rotary, (170,) Strawn and Drum 138,823
Soap boiling establishments, disinfecting, (98,) S. Struns 138,954
Soap crutching machine, (26,) S. Struns 138,953
Sofa, (62,) W. R. Conger 138,860
Soldering iron, (136,) A. H. Burnham 138,739
Spinning frames, stopping the spindles of, (142,) H. T. Potter 138,929
Squares, machine for graduating carpenters', (97,) H. K. Jones, (reissue) 5,408
Stamp, revenue, (54,) R. F. Hunter 138,891
Stave jointer, (40,) J. J. Ralya 138,762
Steam or air brakes, operating, (122,) S. F. Clouser 138,859
Stereoscope, (157,) A. Quirolo 138,930
Stock feeder, (144,) C. M. Hall 138,801
Stove door, (154,) D. N. Martin, (reissue) 5,405
Table, &c., folding, (62,) H. Loth 138,904
Table leaf support, (62,) G. C. Thomas 138,769
Tan vat, (92,) C. H. Manning 138,906
Telegraph cut out and switch, (50,) R. Henning 138,889
Telegraph, printing, (50,) T. A. Edison 138,869
Telegraph, printing, (50,) T. A. Edison 138,870
Tent frame, (162,) W. W. Whitcomb 138,774
Tire bending machine, (60,) J. Tomlinson, (reissue) 5,409
Track clearer, (120,) J. H. Miller 138,913
Trap, fly, (63,) Ernst and Lucas 138,797
Tuyeres, compound for, (12,) J. E. Atwood 138,781
Type setting machine, (117,) S. H. Orwig 138,922
Umbrella, (165,) J. B. Blair 138,789
Umbrella support, (165,) G. S. Cooper 138,861
Valve device for steam and air brakes, (152,) G. Westinghouse, Jr 138,827
Veneer cutting machine, (174,) Leelie and Smith 138,901
Wagon bolster plate, (31,) T. and J. Pickard 138,816
Wagon standard, (31,) Kinsley and Ferguson 138,897
Wagon tires, measuring wheel for, (42,) T. Whiting 138,889
Washer, ore, (3,) R. Solliday 138,948
Washing machine, (91,) A. H. Calkins 138,733
Washing machine, (91,) A. H. Calkins 138,734
Washing machine, (91,) J. D. Hartzell 138,808
Washing machine, (91,) D. B. Pond 138,928
Washing machine, (91,) C. L. Rose 138,937
Washing machine, (91,) P. B. Watson 138,969
Washing machine, (91,) V. White 138,970
Watch key, (36,) Allen and Hall 138,779
Water colors, preparing and packing, (107,) E. L. Molineux 138,915
Water wheel, (166,) J. P. Collins, (reissue) 5,407
Water wheel, (166,) A. B. Reniff 138,933
Wire, rolling, (163,) Walton and Fallows 138,966
Wood filling and paint compound, (107,) J. Miller 138,914
Wrench, (100,) H. F. Read 138,933

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MAY 13, 1873.

Abraham, G. F., Marine safe 138,832
Adams, J., Jelly glass lid 138,833
Adams, J. R., Railroad switch 138,834
Aiken, A. J., assignee, (reissue) 5,404
Allen, F. E., and S. G. Hall, Watch key 138,779
Arnold, J. W., Railway snow plow 138,836
Aston, J., Breech loading fire arm 138,837
Atkinson, I., Curing and packing meats, (reissue) 5,410
Atkinson, W. B., Railroad frog 138,835
Atwater Manufacturing Company, assignee 138,753
Atwood, J. E., Compound for lining bottoms of Bessemer or Kelly converters 138,780

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 200 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorised by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, stock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

GEO. C. ROBERTS *vs.* WM. F. RYER.

[In Equity.—Before Blatchford, Judge.—Opinion filed March 18, 1873.]

THE REISSUED PATENT OF D. W. C. SANFORD FOR REFRIGERATORS DECLARED VOID—SANFORD'S REFRIGERATOR COMPARED WITH LYMAN'S.

The claim for "the employment, in a refrigerator, of an open-bottom ice-box, or equivalent thereof, in combination with a dividing partition, open above and below, so placed that by means of self-operating internal circulation the whole of the contained air shall be kept in motion, and caused to revolve around this partition in currents, moving downward only on one side of this partition, and upward only on the other side, when the same is combined with a chamber for the refrigeration of food or provisions, placed directly under said ice-box," held to be infringed by a refrigerator in which there is no dividing partition distinct from the walls of the open-bottom ice-box, the construction being in other respects the same.

Sanford's refrigerator compared with the earlier invention of Asel S. Lyman.

A suit in equity, under the reissued patent of D. W. C. Sanford, granted April 21, 1857, the original of which bore date November 13, 1855, the alleged invention consisting of an improvement in refrigerators.

Besides the general issue, the defendant set up the special defense of prior invention by Azel S. Lyman, as set forth and fully discussed in the opinion of the Court.

[*Barrett & Redfield* and *Thos. A. Jenckes*, for complainant. *F. A. Betts, J. Gutman, Jr.*, and *J. N. Piper*, for defendant.]

BLATCHFORD, *J.*:

This suit is brought on reissued letters patent, granted, April 21, 1857, to D. W. C. Sanford, for an "improvement in refrigerators," the original patent having been granted to Sanford, as inventor, November 13, 1855, and the patent, as reissued, having been extended October 20, 1869, for seven years from the 13th of November, 1869. The reissued patent has three figures of drawings, which are referred to in the specifications annexed to it, figure 1 being a "perspective view, exhibiting the interior of the refrigerator," figure 2 "a vertical middle section," and figure 3 "a perspective of a smaller-sized refrigerator, with one of the apartments contracted." The specification says:

"My invention consists of an improvement in refrigerators, whereby the whole of the contained air is kept in continual rotation, purification, desiccation, and refrigeration, and with economy of ice. The circulation of the air of my refrigerator is entirely confined, and consists of a continuous movement, or rotation of the air confined within the apartment, without any communication with the external air, except when it becomes unavoidable, from opening the refrigerator. I have found, for purification, that external air is not necessary, and it is obvious, that any arrangement by which a current of external air, after being cooled, is passed through the refrigerator, must be attended with a great consumption of ice, and that any arrangement which admits of stagnation of air in any part of the refrigerator, and does not compel circulation of air throughout the entire apartments, is highly objectionable. Both of these conditions I have avoided, as will be seen from the following description."

Then follows the description, with references to the drawings. Within a suitable casing a partition is inserted, with an opening over the partition, at its top, and an opening under it, at its bottom, so that there is free communication between the two apartments formed by the partition. The drawings show the partition as being vertical and the openings as being of little vertical height. At a high point in one of the apartments an ice-receptacle is placed. This receptacle is perforated in the sides and bottom, so as to allow free passage of air through, and in contact with, the ice. The ice is prevented from coming into contact with the sides of the receptacle, by projections indicated, which, in this case, are stated to be made by punching the holes in such a way that a portion of the metal is protruded. The bottom of the ice-receptacle is funnel-shaped, so as to conduct the water of the melting ice to a central discharge, whence it falls into the cup, or flaring end, of an escape-pipe, which passes directly out through the

side of the refrigerator. It is stated to be important that the escape-pipe should occupy as little room as possible, in order not to obstruct the motion of the air. The shelves in the two apartments are perforated, to allow of the free transit of air. The apartment above which is the receptacle is designated as apartment C. The apartment on the other side is designated as apartment D. The opening at the top of the partition is designated as B′, and the opening at its bottom as B″. The specification then proceeds:

"When the ice is placed in its receptacle, and the refrigerator closed, the whole of the contained air will be set in motion, and continue to circulate or revolve as long as there is any ice or refrigerating material in the receptacle. The operation is as follows: The denser air in contact with the ice and walls of the receptacle descends, and its place is immediately supplied with warmer air from the apartment D, through the opening B′. The denser air, descending through the entire apartment C, and passing through the opening B″, keeps up a continual displacement of the whole of the contained air of the refrigerator. The apartment D has a higher temperature than apartment C, and the temperature varies, with a gradual rise from the time the air leaves the receptacle until it arrives at the upper part of apartment D. It is evident, that the rotation of the air will continue until the ice is melted and an equilibrium of temperature takes place throughout the entire refrigerator. As the air passes through the apartments, it imbibes moisture from fruits, vegetables, meats, and other articles, and, when it comes into contact with ice, its capacity for moisture is diminished by condensation, and the moisture is condensed upon the ice, and passes off with the waste water. The circulating air thus being continually desiccated, every part of the apartments is kept from mold and dampness. The exhalations and odor of meats and other articles are also precipitated upon the ice with the condensed vapor, and thus the entire apartments are kept sweet.

"It is well known, that mold will not generate in a current of air, and it is known, that, when once formed, it propagates itself and spreads with rapidity. Therefore, if any one part of the refrigerator be out of the direct course of circulation, the air will stagnate there, and develop mold, which will contaminate the whole apartment. The apartment D may vary in width, and it may be, as shown in fig. 3, so narrow as to serve merely as a passage for the ascending current of air, the greatest benefit being always derived from the downward current, in apartment C.

"I am aware, that various devices have long since been known for causing the internal circulation of air in apartments of houses and refrigerators, but I am not aware, that, in any instance, a complete and continued rotation, purification, desiccation, and refrigeration of the whole of the contained air of a refrigerator has been compelled under the same arrangement as in my improvement. Therefore, what I claim as my improvement in refrigerators, is the employment of an open-bottom ice-box, or equivalent thereof, in combination with a dividing partition open above and below, so placed, that, by means of self-operating internal circulation, the whole of the contained air shall be kept in motion, and caused to revolve around this partition in currents, moving downward only on one side of this partition, and upward only on the other side, when the same is combined with a chamber for the refrigeration of food or provisions, placed directly under said ice-box, as set forth. I do not claim, by itself, a partition dividing vertically one compartment of a refrigerator from another, nor do I claim placing articles to be refrigerated in a descending current of air; but, I do claim placing shelves or fixtures for holding articles to be refrigerated, or the articles themselves, in the descending current directly under an open-bottom ice-box, in combination with a dividing partition open above and below, as set forth. I claim, in combination with said shelves or fixtures, so placed, constructing the open bottom of the ice-box in such manner that the air may pass freely down through the same, and fall directly from the ice upon the articles to be refrigerated, while, at the same time, the drip of the water is prevented, as set forth."]

The figures 1 and 2, in the figures of drawings in the reissued patent, represent the vertical partition as in the middle of the width of the refrigerator. Figure 3 represents the apartment C, under the ice-receptacle, as occupying nearly the entire width of the refrigerator, and the apartment D as a mere flue, without shelves, and too narrow for any other use. Figure 1 represents the shelves in each apartment as constructed of parallel rods, each rod as long as the width of the apartment, and parallel with the width of the refrigerator. There are, in figure 2, arrows, pointing vertically downward in apartment C, and vertically upward in apartment D, indicating the course of the air.

In the drawings of the original patent, there are but two figures. In each of them, the vertical partition is in the middle of the width of the refrigerator. The shelves in figure 1 are represented as, each of them, one-half of it, in a direction parallel with the width of the refrigerator, solid, and the other half of it perforated with holes, and so arranged that each solid half has a perforated half immediately above it and a perforated half immediately below it, and each perforated half has a solid half immediately above it, and a solid half immediately below it. There are, in both figures, arrows, representing the currents of air as passing diagonally from one perforated part to another perforated part. The specification of the original patent, after its reference to the drawings, contains everything that is above set forth as contained in the specification of the reissue, and in the same words, with the exception of what is above put in brackets, as quoted from the reissue, and that is not found in the original specification. Instead of it, the original specification contains this language:

"I am aware, that various modes have been tried and used for circulating air in refrigerators, but I am not aware, that, in any instance, a complete and continued rotation, purification, desiccation, and refrigeration of the whole of the contained air in the refrigerator has been compelled, as it is in my invention, and I, therefore, claim the arrangement herein set forth, for causing the perpetual rotation of the whole of the air contained within the refrigerating apartments, said arrangement consisting, when the refrigerator is closed, of an endless passage or chamber, the walls, shelves, and ice-receptacle of which are so placed and constructed, that the air is compelled to circulate through the entire apartment or apartments, and from which the water of the melting ice is discharged immediately from the refrigerator, instead of flowing between its walls, the whole being constructed as hereinabove set forth."

It is apparent, from the language of the specification of the original patent, that Sanford, when he applied for his original patent, believed that he was the first inventor of any arrangement in a refrigerator, whereby there was effected a complete and continued rotation, purification, desiccation, and refrigeration of the whole of the contained air of a closed refrigerator. He, therefore, claimed, in that specification, the use, in a closed refrigerator, of an endless passage, furnished with walls, shelves, and ice-receptacle, so placed and constructed as to compel the perpetual rotation or circulation, throughout the entire apartment or apartments, of the whole of the air contained therein, with the provision described for the discharge of the water of the melting ice, the whole being constructed as set forth. The rotation of the air in a closed refrigerator, through the ice-receptacle, was the great feature dwelt on by Sanford, in the original specification, and the statement of the invention, in that specification, and in the reissue, in the same words, shows, that, when applying for the reissue, the same idea was entertained by Sanford, namely, that he was the first person to make an improvement in refrigerators, whereby the whole of the contained air, in a closed refrigerator, should be kept in continual rotation, purification, desiccation, and refrigeration, or, in other words, the first person to make such an arrangement of ice-box and dividing partition, that, by means of self-operating internal circulation, the whole of the contained air, in a closed refrigerator, should be kept in motion and caused to revolve around the partition. This is further shown by Sanford's statement, made September 16, 1868, and filed in the Patent Office October 7, 1868, in his application for the extension of his patent, in which he says, that he made his improvement because he had seen, in Schooley's refrigerator, a defect, in introducing external air, cooling it by the ice, and suffering it to escape, thus allowing a continuous stream of warm air to enter the refrigerator and a stream of cold air to flow out of it, and wasting the ice; that he set himself to overcome such defect; and that he did so "by closing the external openings of Schooley's refrigerator, and making, instead thereof, an opening in the top of the partition, above the ice, so as to have a free communication from one side of the partition to the other, through the openings at the top and bottom of the partition, thus causing, by means of the ice, a continuous rotation of the air contained in the refrigerator, by which contrivance a lower temperature was produced, with less consumption of ice, than when the air was allowed to escape as soon as it was cooled, as in Schooley's." The economy of ice necessarily follows from establishing the rotation of the air in the closed refrigerator, and that rotation is established by causing the air to rotate through the ice-box, from top to bottom, and then down, and under the bottom of the partition, and then up, and over the top of the partition, and into the top of the ice-box again. In the rotation, the air is, necessarily, by frequently coming into contact with, and passing through, the ice, purified, dried, and made cold. The cooling of the air initiates the rotation, if there be an open bottom to the ice-box, and a dividing partition open above and below. When the rotation has once commenced, it must continue, and the other consequences described must follow.

With this general view of the invention, we are prepared to consider what the reissue claims. There are but two claims, really, in the specification. The first claim is a claim to a combination of three elements—(1.) An open-bottomed ice-box, constructed in such manner, that, by the perforation of holes in the sides and bottom of the box, the air will pass freely down through, and in contact with, the ice in the box, so that it can fall directly from the ice upon articles to be refrigerated; (2.) A dividing partition, open above and below, so placed, in relation to such ice-box, that, by means of self-operating internal circulation, in a closed refrigerator, the whole of the contained air shall be kept in motion, and caused to revolve around such partition, in currents moving downward only on one side of such partition, and upward only on the other side; (3.) A chamber for the refrigeration of food or provisions, placed directly under the ice-box, whether there are shelves or fixtures in such chamber, to hold the articles in the descending current, directly under the open-bottomed ice-box, or whether such articles are placed in such current, in such chamber, under the open-bottomed ice-box, not by means of shelves or fixtures placed there, but by being suspended there, or placed on the floor, or otherwise kept in position. The claim which immediately follows the two disclaimers is the same thing as the claim which precedes such two disclaimers, and must be read as an explanation of it. The second and last claim is a combination of three elements, namely, the first and third elements of the first claim, combined with the described arrangement for carrying off the water, whereby the cold air can fall directly down upon articles to be refrigerated, while the water is prevented from dripping into the apartment.

This construction of the specification is that indicated in the case of *Roberts* vs. *Harnden*, (2 Clifford, 500.) In that case, the partition in the defendant's machine did not extend downward below the lower end of the side of the ice-box, and, in fact, the side of the ice-box constituted the partition; and it was urged, that the defendant had no device or partition, to keep separate the ascending currents and the descending currents. But, the Court held, that, so long as the general tendency of the air in the compartment containing, and beneath, the ice-box, was downward, and the general tendency in the other compartment was upward, the difference in the arrangement of the partition was not such as to relieve the defendant from the charge of infringement, it appearing that he extended the side of the ice-box downward far enough to perform the same function, in substantially the same way, and to produce the same result, as the plaintiff's partition.

In the case of *Roberts* vs. *Harnden*, it is stated, that the novelty of the invention was denied by the answer. On that point, all that is said, in the decision of the Court, is, that the defendant had not introduced any satisfactory evidence tending to show that the patentee was not the original and first inventor of what is described in the reissued patent as his invention. It is understood, that the principal defense relied on was the alleged prior invention of one Thaddeus Fairbanks. An *ex parte* affidavit of Azel S. Lyman, made April 6, 1864, with a drawing annexed to it, is shown to have been introduced in evidence, in the case against Harnden, on the point of a prior invention by Lyman, and to have been the only evidence introduced in that case on that point. That affidavit contained only a description of a refrigerating car, two of which were fitted up, in 1853, under the direction of Lyman, and were used by him, in July and August, 1853, in carrying oysters and a dressed sheep, by rail, from New York to Cincinnati, and in being loaded, near Columbus, Ohio, with dressed beef and lambs, and started for home. On the contents of that affidavit alone, no Court could hold the Sanford patent to be void for want of novelty.

The defendant has a refrigerating-room which he uses in his business as a butcher, and which is alleged to infringe the plaintiff's patent. The room is eight feet three inches long, six feet two inches wide, and six feet high. The ice-box, at one side and in one corner, elevated, is five feet ten and a half inches long, on the long side of the room, three feet six and a half inches high, and two feet six and a half inches wide. On the two sides of this ice-box which are toward the room, there is a space between the top of each of such sides and the ceiling of the room, of eight inches in height, and the length of such two sides, for the ingress of the air of the room into the ice-box. A door from without opens into the ice-box, by which to put ice in. Another door opens into the room from without. The ice in the ice-box rests on a wooden rack on its bottom, which affords a free passage for air. Below the rack is a cold-air chamber, the roof of which is the bottom of the rack, and the bottom of which is formed by two inclines, which slope downward and toward each other, and toward a center line midway of the width of the ice-box, so as to leave a central opening five feet eight inches long, and two and a quarter inches wide, through which the cold air finds its way downward. The water from the melted ice falls on these inclines, and runs down them and through this central opening, where it is caught by a trough five feet ten inches long and

six and a half inches wide, and set three and a half inches below such central opening. This trough is one foot eight inches above the floor of the room. There are no shelves below the central opening, but there is a rack on the floor, on which meat is placed. The water from the trough is conducted, by a pipe, out of the room. The room has been used in this way for more than nine years.

There can be no doubt, that the defendant's refrigerating-room contains, in combination, the three elements which are found in combination, as before explained, in the first claim of the plaintiff's patent, and that it also contains, in combination, the three elements which are found in combination, as before explained, in the second claim of the plaintiff's patent. The heat given out by articles placed in the room warms the air, which then ascends, and passes over the tops of the sides of the ice box, and thus around the partition, and into contact with the ice, and is thus cooled, and dried, and purified, and descends through the open bottom of the ice-box, and then through the central opening, and, descending further, according to the law governing the action of cooler air, displaces the warmer air, and pushes such warmer air before it, and upward, around the partition, and, so, a rotation or circulation of the contained air in the closed room is established, which goes on so long as any part of the contained air is warmer than any other part of it. The cooled air can fall directly down upon such articles as are placed under the central opening, without being interfered with by, and without interfering with, the disposition of the water from the melted ice, and such water is carried off and not allowed to drip into the room. The modes of operation of the combinations found in the defendant's room, are the same as the modes of operation of the like combinations found in the claims of the plaintiff's patent.

The defense principally relied on in this case is, that, as to both of the combinations in the claims of the plaintiff's patent, he was anticipated by Azel S. Lyman, in inventions and structures previously made by Lyman, and that the defendant, in using a refrigerating-room constructed and operating as above described, has done no more than he was fully instructed to do by such structures of Lyman.

The earliest date sought to be assigned to Sanford's invention is the summer of 1855. That date is the one given by him in his statement, before referred to, filed in his application for extension, as the date previous to which he had paid no attention to the subject of refrigerators.

It is in evidence, that Lyman, on the 20th of August, 1852, filed, in the Patent Office, a caveat for "improvements in railroad freight-cars, for transporting fresh meats, and other articles, which require a very low temperature and pure air." Such caveat contains a description, and drawings referred to therein. The object of the arrangement is stated, in the caveat, to be, to transport dressed meats. The walls, sides, and top of the car are made double, and filled in with a bad conducting material, the car is closed, and the air in it is reduced in temperature, by passing it, in rotation and circulation, through ice, or other cooling material, contained in a box in the car, or through tubes immersed therein. A fan driven by a cord from the axle of the car drives the air down through the cooler. After the air leaves the bottom of the cooler, it passes through a box containing disinfecting material. The air is stated, in the caveat, to be preserved cool, pure, and dry by being passed frequently through the cooler and the disinfecting material, so as to keep the meats from putrefying, the moisture from the meats being deposited on the cold surface, and flowing down, and being caught in a pan below the bottom of the cooler, whence it is carried off, by a tube, to the outside of the car. The caveat states, that Lyman proposes to claim the providing for a constant circulation of air from the car, through the cooler, and through the disinfecting-box, back into the car, by means of a fan, or some other similar mechanical arrangement; the drying of the air, by the precipitation and condensation of the water held by it in solution, by passing it through the cooler; the cooling of the air through the same process; and the construction of a cooling-house, or refrigerator, in the manner above described, except that there would be other arrangements for driving the fan.

Between the date of this caveat and the year 1855, Lyman constructed, and put into successful operation, refrigerating-cars and stationary refrigerators, embodying the principle set forth in such caveat, and constructed substantially on the plan therein stated, the cars being arranged with fans, to assist in the circulation of air, and the stationary refrigerators having no fans, but depending, for such circulation, on the law governing the movements of cooler and warmer airs, free to communicate with each other through an ice-box open above and below. All of these structures embodied the combinations and modes of operation before stated as found, in common, in the defendant's refrigerating-room and in the plaintiff's structure.

In the summer of 1852, Lyman constructed a closed refrigerator, with the open-bottomed ice-box, the bottom of which was horizontal, and the dividing partition extending down no further than the lower end of the side of such box, and a charcoal filter on top of the ice-box. The water was conducted down two inclines, and fell into a pan on the floor of the refrigerator, and was thence carried, by a pipe, through the bottom. He used this refrigerator for some time in his house in Brooklyn, N. Y., and, finding that the space under the ice-box through which the water fell was not utilized, he raised the pan up, and placed it as near to the cold-air opening, and below it, as it could be placed, without interfering with the downward flow of the cold air. Under the pan a wooden shelf was placed, to receive articles. Holes were bored through this shelf, for the passage of the air. The water passed from the pan to the outside, by a pipe running through the side of the refrigerator. In this refrigerator, the opening between the lower edges of the inclines was a central one, as in the defendant's structure. Lyman used this refrigerator, as thus altered, for some time, in his family, placing the principal part of the food he wished to preserve on the shelf referred to, and under such shelf. In the fall of 1852, he put into it a new ice-box, the bottom of which, being open, sloped toward the interior. Below that there was a single incline, sloping toward the outside, to catch and conduct the drip. The opening through which the cold air went down was at the side, and not central, and a flange raised around the edges

of the opening carried the water around the opening, and it was discharged, by a lead pipe, to the outside. Thus the pan was dispensed with. The shelf below the opening remained as before, and so did the charcoal filter above the ice-box. In the summer of 1853, Lyman had a number of these ice-boxes made, and placed one of them in a refrigerator in a grocery store in New York, and showed it to several persons when in operation.

Prior to this, and in August and September, 1852, Lyman had a closed refrigerating-car fitted up. It had two ice-receptacles, each with an open bottom. One operated with the aid of a fan. A pan under the grate on which the ice rested caught the water, and it was conducted out of the car. The air entered that ice-box through a charcoal filter. The other ice-box had no fan. Under the grate of that box was a descending conduit, and the water was caught by a flange. The height of the lower part of the conduit, from the floor, was twenty-six inches. On the floor, directly under the opening, was a rack for meat. The opening was ten inches wide. This ice-box depended entirely on gravity for its circulation. It held nearly a ton of ice, and was placed as near the top of the car as it could be, and yet allow a space twelve inches high, for the passage of air from the car over into the ice-box. The lower end of the descending conduit was fourteen inches below the grate. In September, 1852, this car, so arranged, was taken from New York city to Watertown, N. Y., and there laden with dressed meat. In the summer of 1853, Lyman had two other refrigerating-cars fitted up, being the two referred to in the affidavit made April 6, 1864, before mentioned. In each of these cars there were two open-bottomed ice-boxes, and a conduit under the grate conducted the cold air down to within about eighteen or twenty-four inches from the floor. The air from the car was impelled into the top of both ice-boxes by a fan. The drip was carried out as before. These cars were taken from New York city to Cincinnati, Ohio, in July, 1853, laden with oysters in the shell, and a dressed sheep, which arrived at their destination in good order. They were laden, at Columbus, Ohio, in August, 1853, with dressed beef, and dressed lambs, and taken to New York city, where the meat was sold.

In September, 1853, Lyman put up a closed refrigerator in Syracuse, N. Y., 16 feet long, 16 feet wide, and 16 feet high on one side and 20 feet high on the other side. The ice-box was placed near the top of the highest side of the refrigerator, and was 8 feet long, 5 feet wide, and 3 feet high. The ice was supported by a grate which sloped toward the interior, and, below the grate, was an incline, sloping from the lowest point of the grate in a reverse direction. The cold-air chamber or space thus formed below the grate terminated below in a conduit 16 inches wide and 8 feet long. The lowest part of the conduit was four or five feet above the floor. A shelf was placed about three feet below the opening, and in the descending current of air, and on this shelf articles to be preserved were placed. The drip was prevented by catching in a trough the water which flowed down the incline, and carrying it outside, by a pipe. There was an opening above the sides of the ice-box, through which the air from the refrigerating-room passed into the ice-box. This structure had the open-bottomed ice-box, the partition open above and below, the prevention of drip, the descent of cooled air, the rotation and circulation, the downward currents on one side, the upward currents on the other side, and the chamber for refrigeration directly under the open-bottomed ice-box.

In April and May, 1854, Lyman caused to be constructed for one Tilton, a closed refrigerator, which was put in use by him in Franklin market, New York, during the summer of 1854, and was used by Tilton there for several years afterward. It embodied the same principles of construction and mode of operation as the Syracuse refrigerator. It had a descending conduit five or six inches wide and about three and a half feet long, and the lower end of which was about sixteen inches above the floor. It was used to preserve poultry, which was placed on three shelves. One of the shelves extended under the conduit. This refrigerator stood in the open market for several years after the summer of 1854. Lyman personally showed it to a great many persons, and explained its internal arrangements, and its principle and mode of operation.

In the summer of 1854, Lyman caused to be built nine closed refrigerators, for domestic use, which were like the Syracuse refrigerator in construction and mode of operation, except that they had no shelf below the cold-air opening, but had a space or chamber there, for articles to be refrigerated. These refrigerators were built at Mount Vernon, Westchester county, N. Y. Lyman used one of them in his family, for a dozen years or more from and after July, 1854. Some of the others were sent to New York and disposed of to various persons, and some were used in Mount Vernon.

Between 1852 and 1855, at least a dozen closed refrigerators, of like construction, were made at the Novelty Iron Works, in the city of New York, according to plans furnished by Lyman. In some of them the conduit extended down only one and one-half inch below the cold-air chamber under the ice-grate, and in others it extended down to within twelve or sixteen inches of the floor of the refrigerator. These refrigerators were delivered to various parties for whom they were made. Of the above number, eight or ten were constructed at such Works during the year 1854, and one of those, made there by one Hadden, for his own use, is still in existence, and has been put in evidence, and produced for the inspection of the Court. This refrigerator was used by Hadden in his family for four or five years. It was and is, in construction, like the Syracuse refrigerator before described, except that it has no shelf below the cold-air opening. In using it, however, Hadden placed on the floor, in and under the descending current of cold air, articles which he desired to keep the coldest. The cold-air opening at the bottom of the conduit is fifteen and three-fourths inches long, and two and one-eighth inches wide, and is eleven and one-half inches above the floor of the refrigerator.

On the 21st of September, 1854, Lyman filed, in the Patent Office, an application for a patent, for an "improved mode of cooling, drying, and disinfecting air for ventilators and refrigerators." It consisted of a petition, specification, oath, and drawing (of 3 figures.) A model was filed November 1, 1854. The specification says:

"My improvement in refrigerators consists in so arranging them, that, as fast as the air becomes warm and moist and impure, by contact with the meat, it is drawn off, and passed through

the material, where it is cooled, dried, and disinfected, and then returned to rise again among the articles in the refrigerator, collecting moisture and impurities, which it deposits in the receptacle intended for that purpose, thus keeping up a full circulation, and thoroughly ventilating the refrigerator with dry, pure, cold air. It is found, that meat, instead of becoming wet in a few days, in this refrigerator, becomes gradually dry."

The drawings represent a refrigerator constructed substantially like the Syracuse refrigerator, and the Hadden refrigerator, before mentioned. There is an ice-receptacle, high up, an open, grated bottom thereto, a cold-air chamber below, a conduit below that, for the exit of the cold air, an arrangement for catching the water and conducting it to the outside, without interfering with the downward flow of the cold air, and an opening over the top of the dividing partition, through which the air which has passed under the open bottom of the dividing partition can find its way into the ice-box, the inner side and bottom of the ice-box, and the inner side of the conduit, forming the dividing partition. The specification states, that, the receptacle being filled with fragments of ice, the air among such ice will be cooled, and, becoming more dense, will settle down through the grate on which the ice rests, into the cold-air chamber below such grate, and thence down the conduit; that, so long as the air in the ice-box is colder and heavier than that in the refrigerator, it will continue to fall down the conduit, mingling with the lower strata, and forcing the upper strata, or warmest air, through the opening above the dividing partition, into the ice-receptacle, and that, when this air comes in contact with the cold surfaces of the ice, its capacity for moisture is lessened, and the moisture is deposited on the ice. The specification proceeds:

"By this arrangement of the ice-receptacle in the upper part of the refrigerator, with an opening for receiving air in its upper part, and a grate at the lower part, on which the ice rests, a cold-air chamber below the grate, and a descending conduit from this cold-air chamber, or with an arrangement of parts substantially the same, so that the air shall be caused to circulate rapidly, from bottom to top, in the refrigerating-chamber, and from top to bottom in the separate combinations, as described, the air is not only cooled, but it is, by being frequently passed through the interstices of the ice, thoroughly dried, and it is washed as by a hail storm, a decided improvement in its smell is effected, and the apparatus becomes not only a cooling and drying, but, to some extent, a disinfecting apparatus, and meat placed in it is preserved fresh and pure a longer time than in any other refrigerator in common use, where both are kept at the same temperature, and use the same quantity of ice."

The claim in the specification is, to "the combination of the reservoir of cooling, drying, and disinfecting material, with the descending tube or conduit, so that the cold condensed air in this conduit shall, on account of its increased weight, cause the warmer air to pass more rapidly through the material where it is cooled, dried, and disinfected, and, in its turn, to fall down the conduit, being, by its sides, kept separate from the other air until it mingles with the lower strata, substantially as described, for the purposes specified." This application was rejected on the 27th of November, 1854, for want of novelty, on the strength of three prior rejected applications, made by Thaddeus Fairbanks, James Lentell, Jr., and John Lewis, respectively. On the 20th of February, 1855, Lyman filed, as an amendment, a new specification, drawings, petition, and model. No copy of such new specification is furnished. On the 10th of March, 1855, the Patent Office, in examining the case, expressed a doubt whether the difference of temperature between the descending column from the ice-chamber, and the air in the body of the refrigerator, would afford motive power or draft practically sufficient to maintain a current. Lyman, on the 28th March, 1855, wrote to the Office, that he had actually demonstrated that the difference in temperature between the air in the ice-box and descending flue, and the air in the body of the refrigerator, produced a circulation; that he had made several refrigerators on his plan; and that, in all, an abundant circulation existed, producing a remarkable effect in drying and purifying the air. In June, 1855, Lyman appears to have dropped the prosecution of such application; but, on the 1st of December, 1855, eighteen days after the granting of the patent to Sanford, he filed a petition, specification, oath, drawing, and model, in a new application, the fee paid on his caveat of August 20, 1852, being allowed to him as a payment toward the fee on this application. The specification and drawing are the same that are annexed to the patent afterward granted to Lyman, March 25, 1856, for an "improved method of cooling and ventilating rooms, &c.," and the drawing is the same, substantially, as that annexed to Lyman's application of September 21, 1854. On the 5th of December, 1855, the Patent Office rejected the new application of Lyman, assigning, as the only reason, that it was anticipated by the patent granted to Sanford November 13, 1855. In reply, the Office was reminded, that, in granting Sanford's patent, either Lyman's prior application must have been overlooked, or must have been deemed not to interfere with Sanford's; that Lyman was, according to the records of the Patent Office, the first person to construct a refrigerator in which the whole of the contained air was compelled to circulate through the ice-box, thereby securing perfect ventilation and drying; that a caveat for the invention was filed by Lyman August 20, 1852; that the application for a patent was filed by him September 21, 1854; that the papers in the application now rejected were in strict accordance with the invention as first submitted; and that yet a patent had been issued to Sanford, without notice to Lyman, and for what was now declared to be the same invention. Thereupon, on the 25th of March, 1856, a patent was granted to Lyman, as above stated. The specification of that patent says:

"My improvement in cooling, drying, and disinfecting consists in the peculiar construction of the box or reservoir for holding the ice or other cooling material. The object sought to be accomplished, by this construction, is the production of a blast or current of cool air in a determined direction, without mechanical aid, and irrespective of place. The principle I employ is that which is exemplified in the hydrostatic column, and my use of it may be understood by the following comparison: If we suspend a cake of ice freely in the air, and near to the ceiling of a closed room, slight currents would soon be produced by the disturbance of the equilibrium, consequent upon the cooling of the air in contact with the ice. These currents would be feeble, because the cold descending air would spread out over a wide base, and the temperature soon become equalized, by mixture with warm air. If, however, we place under the ice a pipe of sufficient size to surround the ice, the air, as it cooled, would fall down and soon fill the pipe, but still have a tendency to spread laterally, in consequence of its gravity, and, therefore, it would exert pressure on all sides, similar to a non-elastic fluid. If a plug were now pulled out of the bottom of the pipe, this air would pour out with a certain force, due to the difference of temperatures outside and inside, and to the height of the column, obeying precisely the same laws which would govern a non-elastic fluid. The construction of a refrigerating-box on this principle enables me to employ it to various useful and valuable purposes, such as the preservation of meats and vegetables, ventilating, cooling, drying, and disinfecting apartments in hospitals, sleeping and other rooms, all which will appear in the following description of the construction and operation of my refrigerating apparatus. This apparatus consists of three parts, viz.: A reservoir, or receptacle, for the cooling material, a cold-air chamber, and a conduit or blast pipe. The reservoir, when adapted for holding ice as the cooling material, is a box open at the top, and as shown at D, Fig. 1. This is divided into two compartments, by a grating, the latter serving to support the ice, while the space beneath forms the cold-air chamber E, which allows of the free settling of the cold air from all parts of the grate. At F is the conduit. This is a trunk or pipe attached to the cold-air chamber, and may be of differing lengths, according as the blast is to be more or less forcible, the higher the column the greater being the weight and velocity of the discharge. I will now describe the manner of application, together with some of the various uses to which the instrument may be put. When inclosed within the air-tight compartment, (as shown in figure 1, at A,) and the box, D, is charged with ice, the moisture will be extracted from the air at the same rate that its temperature is reduced, in the following manner: The air in A is, at first, of the temperature of the surrounding media, and its hygrometrical condition is the same. Ice being now introduced into the box, D, the air in contact will be immediately reduced in temperature, condensation takes place, and moisture is deposited. The condensed air being of greater specific gravity, falls into the air-chamber, E, flowing thence into F. Here, as it cannot spread out and commingle with the external and lighter air, it drives that already in the pipe before it, and out at the bottom, finally pouring out itself in a continuous stream. Once out, it still continues to act similar to the flow of water, spreading over the floor, and, in doing so, displaces the lighter and warmer air, forcing the latter upward toward the top of the apartment. As it there comes in contact with the ice, the condensation and precipitation of moisture goes on until a minimum temperature is reached. Thus, a continual circulation is kept up, in such a manner that the whole of the air must circulate through the ice-box. Of course, all articles, such as meats and vegetables, would be deprived of their moisture in a like degree with the air, the latter being brought to the condition of great purity and dryness. As the water collects, it falls to the bottom of the cold-air space, E, when it is discharged to the outside, by a suitable pipe."

The claim of the patent is, to "the combination of a descending conduit or cold-air flue, with a reservoir for containing cooling materials, substantially in the manner, and for the purpose, described."

There is nothing in the patent of 1856, to Lyman, that is not found fully developed in his application of September, 1854. In view of that application, the patent to Sanford, of November, 1855, ought not to have been granted. Lyman's application contained everything claimed by Sanford in his patent, namely, the arrangement, in a closed refrigerator, of an endless passage or chamber, running through an open-bottomed ice-box, and out at the bottom of it, and down, and under a partition, and up, and over such partition, and into such box again, the construction being such, that the whole of the contained air circulates through such passage, and the water of the melting ice is discharged immediately from the refrigerator. If the patent of 1856, to Lyman, was properly granted, with the claim it contains, a patent ought to have been granted to him on his application of 1854, with the claim then asked for. The evidence shows, that Lyman was the first inventor, as between him and Sanford, of what is claimed in Lyman's application of 1854, and of what is claimed in Sanford's patent of 1855, and of what is claimed in Lyman's patent of 1856.

So, too, everything that is claimed in the claims of Sanford's reissue of 1857, as those claims have been heretofore explained, is found in Lyman's application of 1854.

Lyman never abandoned his invention. He devoted much time to perfecting it, commencing in 1852, and, after his refrigerators of 1854 had been constructed, and he regarded his invention as perfect, he applied for a patent.

It is urged, on the part of the plaintiff, that Lyman's structure did not contain a chamber of refrigeration, with shelves or fixtures for holding the articles to be refrigerated, placed in the descending current, directly under an open-bottomed ice-box. As before explained, it does not require that the chamber should have shelves, in order to be Sanford's chamber. The Syracuse refrigerator of Lyman had such a chamber, with such a shelf, and so did the Tilton refrigerator of Lyman. Some of his other structures had such a chamber, and so much of the chamber as was directly in the descending current could be, and was, used for the deposit of articles to be cooled. The question is merely one of degree. In the Syracuse refrigerator, such descending current was sixteen inches wide, eight feet long, and four or five feet high. In the Tilton refrigerator, it was five or six inches wide, three and a half feet long, and sixteen inches high. In the defendant's refrigerator, it is only five feet eight inches long, two and one-fourth inches wide, and twenty inches high. In the Hadden refrigerator, it is fifteen and three-fourths inches long, two and one-eighth inches wide, and eleven and a half inches high. In Sanford's original specification, there is no suggestion of the especial advantage of the use of a descending current. Such suggestion, in the reissued specification of Sanford, is an interpolation, and there is as much warrant for saying that Lyman's conduit may vary in width, so as to be as wide as the width of the ice-box, and thus become exactly like Sanford's conduit in the drawings of his original patent, occupying half of the width of the refrigerator and the entire width of the ice-box, as there is for saying, as is said in the reissued specification of Sanford, that the apartment not under the ice-box may vary in width, and may be so narrow as to serve merely as a passage for the ascending current of air. In the structure shown in the drawings of Sanford's original patent, he exhibits a conduit as wide as the ice-box, extending down to the very bottom of the interior, and conducting the descending stream of cold air to the opening through which it passes into the other apartment. That conduit is so wide that shelves to hold articles to be refrigerated, or the articles themselves, may be placed in the conduit, and none of the apartment under the ice-box is outside of the conduit. In Lyman's structures, he made his conduit shorter in length, and narrower in width, so narrow that no shelves could be placed in it and no articles could be refrigerated in it, but, a part of the apartment under his ice-box was outside of the conduit, and a portion so outside of the conduit was directly under the conduit, and in the descending current, and in such current shelves and articles to be refrigerated could be and were placed.

The conclusion at which I have arrived, after a careful consideration of all the evidence and of the argument of counsel, is that the Sanford reissue is void for want of novelty.

As to the questions made respecting the want of notice, in the answer, as to some matters put in evidence, I think, that, in any view, the case is a proper one to allow the amendments to the answer, which were moved for at the hearing, on notice, *nunc pro tunc*, as of the time the answer was filed.

The bill is dismissed, with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,446.—*Straw-Cutters.*—Granted to REUBEN DANIELS, June 21, 1859. Hearing June 4, 1873.

24,451.—*Attachment of Handles to Tin Pails.*—Granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868. Hearing June 4, 1873.

24,456.—*Apparatus for Heating Buildings by Steam.*—Granted to SAMUEL F. GOLD, June 21, 1859; reissued February 6, 1872. Hearing June 4, 1873.

24,478.—*Machines for Sawing Stone.*—Granted to ANDREW T. MERRIMAN, June 21, 1859. Hearing June 4, 1873.

24,484.—*Apparatus for the Manufacture of Paper-Pulp.*—Granted to JOSEPH B. PALSER and GARDNER HOWLAND, June 21, 1859; reissued in two divisions, numbered 996 and 997, July 3, 1860, No. 997 having been again reissued December 15, 1863. Hearing June 4, 1873.

24,488.—*Brakes for Power-Looms.*—Granted to R. and GORDON B. REYNOLDS, June 21, 1859; antedated February 8, 1859. Hearing June 4, 1873.

24,493.—*Door-Frames for Furnaces.*—Granted to PAUL A. SABATON, June 21, 1859. Hearing June 4, 1873.

24,495.—*Harvesting-Machines.*—Granted to WILLIAM and THOMAS SCHERELY, June 21, 1859. Hearing June 4, 1873.

24,512.—*Body-Bolsters for Railway Cars.*—Granted to AMBROSE WARD, June 21, 1859. Hearing June 4, 1873.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,683.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OTIS TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brakes.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JENKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

24,161.—*Improvement in Platform-Scales*, granted to FRANCIS M. STRONG and THOMAS ROSS, May 24, 1859.

Claim.—1. The employment of an auxiliary frame, substantially such as described, in combination with and interposed between the platform and levers, substantially as described, and for the purpose specified.

2. Constructing such intermediate frame in two parts connected by movable joints at the angles, substantially as and for the purpose specified.

3. The manner of constructing and inserting the bearing-blocks that rest on the knife-edges, substantially as and for the purpose specified.

4. Bringing the ends of the arms of the levers immediately one above the other, in combination with the mode of connecting the two with the beam by single and double connecting-rods, substantially as described, and for the purpose set forth.

24,182.—*Channeling Soles of Boots and Shoes*, granted MARTIN WESSON, May 24, 1859; reissued December 1, 1863, numbered 1,586.

Claim.—1. The combination of one or more feed-rolls E F, knife or knives *b b*, and guide R, or its mechanical equivalent, when operating substantially in the manner and for the purpose herein set forth.

2. The combination of lever L, sliding pieces *h h'*, and knives *b b'*, when arranged and operating as described, and forming a knife-holding arrangement, for the purpose specified.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date May 20, 1873.]

6,651.—*Stocking Fabric.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed May 6, 1873.

6,652.—*Stocking Fabric.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed May 6, 1873.

6,653.—*Carpet.*—ALFRED HEALD, Philadelphia, Pa., assignor to MCCALLUM, CREASE & SLOAN, same place. Application filed April 24, 1873.

6,654.—*Carpet.*—ALFRED HEALD, Philadelphia, Pa., assignor to MCCALLUM, CREASE & SLOAN, same place. Application filed April 24, 1873.

6,655.—*Carpet.*—CHARLES A. RIGHTER, Philadelphia, Pa., assignor to DORNAN, MAYBIN & Co., same place. Application filed April 26, 1873.

6,656.—*Floor-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y. Application filed April 30, 1873.

6,657.—*Floor-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y. Application filed April 30, 1873.

6,658.—*Chair-Frame.*—BENJAMIN J. HARRISON, New York, N. Y. Application filed April 1, 1873.

6,659.—*Stocking Fabric.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed May 6, 1873.

6,660.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,661.—*Floor-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y. Application filed May 13, 1873.

6,662.—*Floor-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y. Application filed May 13, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date May 20, 1873.]

1,270.—*Flue for Draft, Ventilation, &c.*—HENRY R. FARMER, Danville, Va. Application filed May 10, 1873.

1,271.—*Metal.*—HARTELL & LETCHWORTH, Philadelphia, Pa. Application filed April 22, 1873.

1,272.—*Salve.*—L. HARWOOD & SON, Warren, Mass. Application filed May 10, 1873.

1,273.—*Watch-Glass.*—JOSEPH B. LAURENCOT, Hoboken, N. J. Application filed May 10, 1873.

1,274.—*Black and Galvanized Sheet-Iron.*—MARSHALL BROS. & CO., Philadelphia, Pa. Application filed March 26, 1873.

1,275.—*Plow.*—JAMES OLIVER, South Bend, Ind. Application filed April 3, 1873.

1,276.—*Salt.*—STONE & SPENCER, Syracuse, N. Y. Application filed April 30, 1873.

1,277.—*Toilet and other Brushes.*—THOMSON, LAFGDON & Co., New York, N. Y. Application filed May 9, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date May 20, 1873.]

ORIGINAL PATENTS.

138,978.—*Adjustable Chute for Turbine Water-Wheels.*—JOHN ABELL, Woodbridge, Canada. Application filed September 20, 1872.

Upon a stationary ring rests a flanged cast-iron ring, to which is riveted a steel plate that forms one side of each chute and extends the full depth of the rings. The two steel plates hinged together, the lower one of which is riveted to the stationary ring and to the inner casting, form the other side of the chute. By turning a shaft the plates hinged to the cast-iron ring will close upon or recede from the hinged plates to regulate the supply of water.

Claim.—1. Combination of the movable cast-iron ring A, steel plate C, and inner upper casting, of which the rack G forms part, operated by the pinion F on the vertical shaft H, substantially as and for the purpose specified.

2. The combination of the stationary part B and lower steel plate D with the upper steel plate D, hinged at E, and held between the bar *d* and plate C, substantially as and for the purpose specified.

138,979.—*Water-Wheel.*—JOHN ABELL, Woodbridge, and ASHLEY D. COLE, Toronto, Canada. Application filed November 7, 1872.

The stationary part of the chute is cast with the inner and outer shells. The movable portion is hinged to the top of the stationary part. Studs fastened to the hinged plates pass through the slots in the inner shell and through holes in an annular casting, which is fitted within the inner shell and works on the center shaft. By turning the annular casting the hinged plates will be moved and open or close the mouth of the chutes to regulate the supply of water.

Claim.—The combination of the hinged plate B, stud C, and movable annular casting E, substantially as and for the purpose specified.

138,980.—*Friction-Clutch.*—EDWIN ALLEN, Norwich, Conn., assignor to ALLEN MANUFACTURING COMPANY, same place. Application filed April 24, 1873.

Claim.—The friction-pulley formed by the combination and arrangement, with the flat-rimmed loose pulley A, shaft B, and sliding sleeve E, of the friction-arcs C C, which are pivoted at *c c* upon the center piece D, and guided by the slots and screws S S, when operated by the ball-and-socket joints N N and adjustable screw-connections I K *e* I K *e*, substantially as and for the purposes herein set forth.

138,981.—*Machine for Darning Stockings.*—BENJAMIN ARNOLD, East Greenwich, R. I. Application filed September 26, 1870.

The comb is semicircular, and has on the edge which is within the overhanging arm a rack, the teeth of which are engaged by the feed-lever so as to move the comb back and forth, the feed-lever being operated by a cam on the main shaft. The stocking is drawn over the standard, between its top and the overhanging arm, and the row of loops at one side of a square hole placed on the teeth of the comb. The needle passes up through the loops, carrying a thumb, which the looper, operated by a cam on the main shaft, forms into new loops and deposits on the teeth of the comb as the latter is moved along.

Claim.—1. The comb *s*, in combination with the needle *m*, constructed and operating substantially as and for the purpose set forth.

2. The combination of the feed-lever *e* with the comb *s*, substantially as specified, and for the purpose set forth.

3. The looping and casting-off lever *k* and needle *m*, in combination with the comb *s*, substantially as and for the purpose specified.

4. The combination of the feed-lever *e* and lever *k* with the needle *m* and comb *s*, as and for the purpose specified.

5. The combination of the needle *m* with the standard A and slotted plate *n*, substantially as described and for the purpose set forth.

138,982.—*Machine for Darning Stockings.*—BENJAMIN ARNOLD, East Greenwich, R. I. Application filed September 26, 1870.

The comb is a toothed strip of metal, wound helically and made into a semispherical form. The loops around the hole in the stocking are placed on the teeth in the periphery of the comb. The needle passes up through these loops successively, carrying a yarn which the looper forms into a chain-stitch and deposits onto another tooth as the comb is fed around by the levers named in the third clause, one being provided with a diagonal slot, which, as this lever vibrates, moves up and down and back and forth, the under lever to feed the comb around. The clamp, when turned down, is slid under a projection on the frame to keep it in place.

Claim.—1. The spiral or involute comb F, constructed and operating substantially as herein described, and for the purpose specified.

2. The combination of the needle *f* and looper I with the comb F, substantially as and for the purpose specified.

3. The combination of the two levers *e* and *i*, operating substantially as shown and described, to produce a motion suitable for a feed-motion.

4. The clamp N, made so that it can slide and be turned up out of the way when not in use, substantially as shown and described.

138,983.—*Paper-Feeding Machine.*—JOHN THOMAS ASHLEY, Williamsburg, N. Y. Application filed November 28, 1870.

The paper, supported upon longitudinally-adjustable table which is pivoted in vertically-adjustable bearings, is held against flexible supports by its heavier part, and the upper sheet is removed by pneumatic lifter, a revolving wheel with flexible arms bearing against the ends of the pile, preventing more than one sheet from being removed at the same time.

Claim.—1. The self-adjusting table B, supported by means of an oscillating bar C, and adjustable bearings *e*, substantially as described.

2. The stripping flexibly-pointed wheels *h*, in combination with the table B, substantially as described.

3. The arrangement and combination of the strippers *h* with the feed-table B, and reciprocating gripers L, substantially as described.

4. A feed-table, B, which is supported by oscillating bearings and arranged beneath a paper picker-up device, in combination with fingers *g*, against which the paper on the table is pressed by the weight of the outer or rear end of the table, substantially as described.

138,984.—*Means for Closing Hatchways.*—JAMES S. BALDWIN, Newark, N. J. Application filed March 17, 1873.

The elevator-car is combined with an endless apron stiffened by cross-slats, which closes all the the openings except the one opposite the car-platform. The apron is intended to be prepared with a fire-proofing solution.

Claim.—1. A car, in combination with an endless apron, for the purpose of closing all hatchways except the one in use, and for the purpose of preventing a draft by means of open hatchways, substantially as shown and described.

2. The endless apron *c*, provided with slats *i*, and endless rope *h*, in combination with the car *a*, substantially as shown and described.

138,985.—*Elevator.*—JAMES S. BALDWIN, Newark, N. J. Application filed March 17, 1873.

To each of the several drums over which the rope passes is a rotary pump attached, which controls the speed of the elevator.

Claim.—1. The method of regulating the speed of elevators by connecting hydraulic pumps with the several pulleys or drums, substantially as set forth.

2. The pump connected to the drum and pulley of an elevator, so as to check its speed, substantially as set forth.

3. In combination with the elevator, the shells *c* in which the

rotary pistons operate, having partitions *e*, automatic valves *i*, drums, and pulleys, substantially as shown and described.

4. The automatic valve *i*, provided with valve-rod *k*, for the purpose of starting the elevator, substantially as shown and described.

138,986.—*Metal Can for Oil, &c.*—GEORGE W. BANKER, New York, N. Y. Application filed February 5, 1873.

Access is had to the nozzle and faucet of a can inclosed in a wooden case through openings provided with shields, thereby avoiding the necessity of removing the cover to reach the nozzle and faucet.

Claim.—The can B, having a faucet, *b*, and nozzle *d*, both in the top, but on opposite sides, of the can, inclosed in the case A, the curve or top of which is permanently secured to the body of the case and not designed to be removed either in filling or discharging the can, there being openings made in the case for the nozzle and faucet, which are closed respectively by shields *c* and *c'*, or their equivalent, all constructed, combined, and operating substantially as and for the purposes specified.

138,987.—*Stop Mechanism for Looms.*—CHARLES E. BARNES, Boston, Mass. Application filed March 3, 1873.

A weft-fork, hinged to a slide working in brackets on the breast-beam, is placed on each side of the loom, and on one slide is pivoted a vertical arm attached rigidly to a rock-shaft, which extends across the loom below the beam, and carries at its opposite end a corresponding arm, which operates the other slide when the hooked end of the weft-fork falls within its path by reason of the absence of the weft-thread. By this arrangement the usual actuating cam and lever are required on one side only, each fork is acted on by the thread independently of the other, and on whichever side the weft fails the fork on that side will immediately stop the loom through the well-known lever connections. Upon the breast-beam is arranged an oscillating hooked arm for the purpose of removing from the lay the threads of the idle shuttles.

Claim.—1. The slides and their weft-detecters, placed on the breast-beam, when connected and operated substantially as herein described, so that each detecter acts independently of the other, as set forth.

2. The slides and their weft-detecters, placed on the breast-beam, and connected and operated as described, in combination with the oscillating hook H, the latter being arranged to fall on the weft-threads already beaten up when it is necessary to prevent their contact with the detecters.

138,988.—*Machine for Extracting Spikes.*—JOSEPH BARSALOUSE and ROBERT GRAHAM, Kingsbury, assignors to GUSTAVUS A. PRESCOTT, Sandy Hill, N. Y.

A T-shaped bar has on the pivots two jaws operating counter to each other by which a spike is extracted when the lever is pressed down on the fulcrum.

Claim.—The handle A, provided with the T-shaped end and journals *g g*, in combination with the jaws D D and fulcrum C, all arranged in the manner and for the purpose herein specified.

138,989.—*Station-Indicator.*—CHARLES BARTON, Philadelphia, Pa. Application filed February 25, 1873.

The name-stripe are transparent, and are detachable by means of elastic loops. The apron is operated by an air cylinder, supplied from the engine, a piston, and a pivoted slide, the shifting of which from one side to the other, where it is then locked, reverses the movement of the apron. The head of the slide, by falling between the teeth of the ratchet-wheel on the driving-roller, serves to lock this in position.

Claim.—1. The combination of transparent name-plates D with the apron C, the name-plates being detachable therefrom by means of elastic loops connected with the apron, substantially as and for the purpose set forth.

2. The combination of the air-cylinder L and piston M, the slide H, hinged plate I, pawl G, and toothed wheel E, for operating the endless apron C, substantially as and for the purpose above described.

3. The combination of the head *e* of the slide H with the toothed wheel F for holding the roller B securely in position, substantially as described.

138,990.—*Metallic Sweat and Collar Pad.*—JOHN M. C. BENNETT, Ovid, Mich., assignor to himself and WILLIAM C. BENNATT, same place. Application filed August 14, 1872.

Claim.—The adjustable collar cap and shield A, made distinct and separate from the collar, and adapted to be applied between any ordinary collar and the neck of a horse, as and for the purpose set forth.

138,991.—*Manufacture of Whip-Handle Caps.*—GEORGE A. BURR, Florence, Mass. Application filed March 15, 1873.

Claim.—Caps for whips and other similar purposes made out of a composition of which shellac or its equivalent gum or resin is the cementive ingredient, and whether united to a metallic ferrule to form a part of the cap or not, as herein described and represented.

138,992.—*Balanced Valve.*—FRANK P. CADY, Cleveland, Ohio, assignor of one-half his right to SETH M. CADY, same place. Application filed February 21, 1873.

A central disk over the valve is provided with a boss or core, and supports the packing-rings bearing against the steam-chest cover, and they are forced against it by spiral springs bearing on the disk.

Claim.—The disk E, provided with a boss or core, F, supporting-ring G, packings *a b*, and springs H, constructed and arranged, in combination with the valve C and cover I, as and for the purpose set forth.

138,993.—*Electrical Stop for Spinning Machinery.*—HENRY A. CHAPIN, Bridgeport, Conn. Application filed December 31, 1872.

A pivoted finger, forming one electrical pole (and surrounded loosely by a sliding yoke) by resting against the thread, is kept from contact with a plate forming the other electrical pole, but, on the breaking of the thread, makes the contact, and, thus completing an electro-magnetic circuit, causes an armature detent to be withdrawn from the spring shipping-lever, which thus stops the machinery. The said shipping-lever, by the same movement acting on the yoke surrounding the finger, withdraws it from its contact-plate, and thus immediately opens the circuit, so as to be instantly ready for the action of any other thread finger.

Claim.—On machines for spinning or doubling and twisting, especially, and other descriptions of machines mentioned in the specification, the combination of a circuit-opener with, and operated by, the shipping-device, which, instantly that a thread breaks, pulls or pushes the latches or fingers off from their electrical connecting-points, thus reopening the circuit which had been closed by their falling, substantially as described.

138,994.—*Elevating, Conveying, Storing, and Shipping Grain.*—HENRY I. CHASE, PHILANDER F. CHASE, and EDWIN D. CHASE, Peoria, Ill. Application filed March 5, 1873.

Grain-elevator house having on each side grain-bins arranged in rows. Between each double row of grain-bins, extending from the ground upward, is a passage in which the screw-conveyers are placed, extending from the elevator to the rear of the bins.

Claim.—1. The system described of receiving, conveying, storing, and shipping grain, &c., in rows of bins, C D, of one story in height, arranged on either side of an upper and lower line of conveyers, E^1 E^2, one line for receiving and distributing grain, the other for discharging the same, whereby danger and damage from fire is greatly lessened, and storage greatly reduced in cost, all substantially as described.

2. The system described of a combination of elevator-houses, G G, &c., in one line, of not more than two stories in height, from each of which runs back, at a right angle, a double line of store-bins, having an upper and lower line of conveyers, E^1 E^2, built on independent foundations, substantially as described.

3. The construction and arrangement of the bins C D, &c., walls *d d*, stays *e e e*, &c., floor *i*, spouts *f f*, &c., passages, *g g*, &c., conveyers E^1 E^2, posts *k k*, spout *b*, platforms *g h*, and elevator A.

4. The construction and arrangement of the metal or metal-line conveyer-trough Z, cross-pieces *r r*, keys *s s*, rods *w w*, journal-boxes *t t*, trap-doors *o*, continuous flight *y y*, so attached to the axle or shaft as to form a continuous band to prevent the splitting of the axle when heavily worked.

138,995.—*Hair-Curling.*—ELLEN T. CRAIN, Kansas City, Mo. Application filed February 21, 1873.

Claim.—The process of converting straight hair into permanent curls by the employment of the materials and in about the proportions named, and by baking and boiling the hair, substantially in the manner herein before described.

138,996.—*Sewing-Machine.*—JOB A. DAVIS, Brattleborough, Vt. Application filed March 10, 1873.

Makes chain-stitch. A projection on the hook back from its point carries one-half the loop of needle-thread across the other half, twists the loop, and the needle passes through it.

Claim.—1. In a chain-stitch sewing-machine, a vibrating looper, constructed substantially as described, moving in a path transverse or across the plane of the line of stitching, and operating in connection with the needle and feed to give to the loop a twist, substantially as and for the purpose described.

2. The combination, with the removable cloth-plate, of the stitch-making devices, substantially as described, employed beneath the table, so that the removal of such plate shall carry with it such devices without the need of deranging or loosening them.

138,997.—*Stove-Pipe Damper.*—JOHN EMMERT, Chicago, Ill. Application filed November 29, 1872.

When the device is inverted the disk K drops into the circular opening in the plate B, and the plate B falling at the same time upon the plate A, the projections on the plate B close the openings in the plate A, the whole thus forming in effect a close plate.

Claim.—The stove-pipe damper and spark-arrester, composed of the two rings A and B and disk K, connected and applied in the manner set forth.

138,998.—*Thimble for Protecting Boiler-Flues.*—JAMES C. FARMER, Providence, R. I. Application filed February 3, 1873.

The thimble which protects the ends of the tubes from the heat is provided with a lip to receive the blows while being driven, and is held by frictional contact.

Claim.—1. A thimble for the protection of the ends of boiler-tubes molded in one piece from cast or malleable iron, or other suitable metal, and formed with flange *a*, set below the projecting edge *b*, for the purpose set forth, as a new article of manufacture.

2. In a thimble for the protection of the ends of boiler-tubes, the projecting edge *b*, for the purpose of receiving blows of the hammer, and as a means of avoiding the fracture of the flange in driving, substantially as described.

138,999.—*Mode of Attaching Roofing-Slates.*—SAMUEL FARQUHAR, Boston, Mass. Application filed April 4, 1873.

The device forms a readily-detachable fastening for securing slates to the nearly vertical sides of Mansard roofs.

Claim.—The within-described fastening for slates, consisting of the bent plate D, so constructed as to hook over or around a purlin, in combination with a bolt, *b*, one end of which is provided with a head, 9, and the the other end secured by a screw-nut, *c*, or otherwise, substantially as described.

139,000.—*Machinery for Rolling Metal.*—WILLIAM GEORGE and WILLIAM F. DURFEE, Philadelphia, Pa. Application filed February 3, 1873.

The two ends of the table move, when rising or falling, at different rates of speed, and assume properly-inclined positions in virtue of the greater length of the arms *c* than of the arms *c'*, while the approaching and receding movements at such times are due to the links, which, hinged to the housing and to the table, compel the latter to move in the arc of a circle.

Claim.—1. For movement of the tables at the front and back of the rolls of a rolling-mill, the lever-arms *c* and *c'*, combined with the rods *z* and *z'*, and the radius-bars *r r'*, or their equivalents, so that the said tables vary their inclination as they rise and fall, and at the same time approach and recede from the rolls of the rolling-mill, the whole operating substantially in the manner, and for the purpose hereinbefore described.

2. The construction of the tables of a rolling-mill with re-entrant angles, substantially in the manner hereinbefore described.

139,001.—*Cultivator.*—EVANDER M. GRAHAM, Vernon, La. Application filed May 16, 1872.

A frame adapted to receive interchangeable cultivating devices, so that the implement may be used in cultivating different crops.

Claim.—1. The combination of the frame A B, wheels D, axles *x*, hooks I, rod L, and rack or frame E, adapted to receive plows H or other cultivating devices, substantially as shown and described.

2. The combination of the bars E^2 E^3, bolts and nuts 1 2 3 4 5 6 7 8 9 10, and blocks F with the frame A B, substantially as shown and described.

3. The grooves *y* in the frame A B, in combination with the notches *b* in the rack or frame E, substantially as and for the purpose described and set forth.

139,002.—*Spark Arrester and Extinguisher for Locomotives.*—JOHN W. GRAY, Harrisburg, Pa. Application filed February 25, 1873.

A closed top, with a cone attached to it, is arranged on the smoke-stack and combined with inclined guides and the central draft-pipe, by which the sparks are conveyed into a discharge-pipe, into which a steam-pipe enters for extinguishing the sparks.

Claim.—The combination of the arrester F, constructed as set forth, in combination with the draft-pipe I, inclined disk *n n*, discharge-pipe C, steam-pipe *b*, and cock C, as and for the purpose described.

139,003.—*Submerged Force-Pump.*—ABIEL T. HAFFORD, St. Louis, Mo. Application filed March 25, 1873.

The piston-rod and sliding cylinder are connected by side rods. When the piston rises, the sliding cylinder also rises and lifts the water into the main cylinder and piston-cylinder. On its descent the piston forces the water up the discharge-pipe.

Claim.—An improved submerged force-pump, consisting of a main cylinder provided with top and bottom cylinders, having valves, the piston being connected to side rods which further connect to said bottom cylinder, said parts being arranged and constructed to operate as and for the purpose set forth.

2. The combination of cylinders A B C, valves b^1 b^2, and valves a^2 a^3, piston D, as and for the purpose set forth.

3. The combination and arrangement of cylinders A B C, valves b^1 b^2, a^2 a^3, piston D, rods E, and discharge-pipe G, all constructed to operate as and for the purpose set forth.

139,004.—*Adjustable Step-Ladder.*—JOHN J. HARDENBROOK and SAMUEL BELFORD, Columbus Grove, Ohio. Application filed April 5, 1873.

The steps are made adjustable on pivots to correspond with the inclination given to the ladder. A slotted semicircular plate is attached to one or more of the axles, and, in conjunction with a thumb-nut, serves to lock the steps at the required angle, the steps being all connected together by a rod hinged to them at the back.

Claim.—1. The step A made adjustable within the side-pieces F, substantially as and for the purpose hereinbefore set forth.

2. The semi-continuous lever H provided with the thumb-nut K, in combination with the step A provided with the strap B, and made adjustable within the side pieces F, substantially as and for the purpose hereinbefore set forth.

3. In combination, the rod E provided with hinge-joints D, a series of adjustable steps, A, provided with straps B B', and the semi-continuous lever H provided with the thumb-nut K, substantially as and for the purpose hereinbefore set forth.

139,005.—*Machine for Forming Railway Coupling-Links.*—PATRICK H. HEALY, Chicago, Ill., assignor of one half his right to WM. H. BRYANT, same place. Application filed August 6, 1872.

An eccentric on the main shaft forces forward two oppositely-inclined blocks, one on each side of the machine, and a U-shaped former. These inclines cause two rollers (one on the end of each of two oppositely-projecting levers) to converge. The bar is laid in front of the former with the rollers resting upon it in the rear, so that the reciprocations of the former cause the rollers to bend the bar around its outer surface.

Claim.—In a link-forming machine, the combination of the following instrumentalities, to wit: Means for cutting the iron rod to length; means for bending the middle of the same to form one of the semicircular ends of the link; and means for rolling or pressing the ends to a parallel with each other; all the parts constructed, arranged, and operating substantially as described, as herein shown and set forth.

139,006.—*Auger-Handle.*—SAMUEL W. HEMENWAY, Lansing, Iowa. Application filed April 4, 1873.

This handle is designed, by the use of a double ratchet and four pawls controlled by cams, to operate boring-bits in corners or close to joints by a reciprocating movement of the hand where a rotary motion would be impossible.

Claim.—1. The combination of the double-ratchet wheel A, spring-pawls *d d*, and cam-pins D D, constructed as described, and arranged within the bisected casing B C, substantially as and for the purposes herein set forth.

2. The slotted annular plate G, provided with lips *m m*, used in combination with the ratchet-wheel A, for fastening the socket H to the same, substantially as herein set forth.

139,007.—*Windmill.*—THOMAS R. JACKSON and ASHERET C. JACKSON, Sabine Pass, Tex. Application filed January 13, 1873.

A wind-wheel, with adjusting devices, arranged beneath a semicircular case. The wings radiate from a vertical shaft, and are secured to hubs causing rotation in a horizontal plane. The shaft is stepped below on a suitable bearing, and has a spur-wheel keyed to it for transmitting motion to machinery.

Claim.—The pulley D, applied fast to the bottom of the semicircular case C, and receiving freely through it the shaft B^1 of the wind-wheel B, in combination with the pulley E and belt *d*, substantially as and for the purpose described.

139,008.—*Grain-Binder.*—SYLVANUS D. LOCKE, Hoosick Falls, N. Y. Application filed March 17, 1873.

Claim.—A revolving knotting-hook, provided with a retaining-shoulder, *g*, combined with an inflexible jaw, *f*, and a flexible jaw, *e*, constructed so as to yield and release the loop when the severed ends are retained in the knot, substantially as set forth.

139,009.—*Treating Heavy Petroleum.*—JOHN JAY LOONEY, St. Petersburg, Pa. Application filed November 2, 1872.

Claim.—The treatment of crude or heavy petroleum, previous to distillation, with a compound or mixture of benzine and sulphuric acid, in the manner and for the purpose substantially as set forth.

139,010.—*Cleaning Oil-Wells.*—JOHN J. LOONEY, St. Petersburg, Pa. Application filed November 2, 1872.

By pouring into the well a solution of potassa, also a certain amount of sulphuric acid, and a quantity of benzine and sulphuric acid.

Claim.—1. The within-described process of removing the paraffine and other resinous deposits from oil-wells, for the purpose of increasing the flow of oil.

2. The use of the compound or mixture of benzine and sulphuric acid, in the manner and for the purposes set forth and described.

139,011.—*Razor-Strop.*—JOHN B. LUCAS, Portland, Me. Application filed March 19, 1873.

The leather strap is provided with a non-extensible base, composed of paper or paper and cloth combined.

Claim.—The combination, with the strop *d* having the filling *k*, made of strong Manila paper, or paper and cloth combined, as described, of the handle *a*, screw-rod *b*, cylinder *f*, end pieces *e e'*, and rod *h*, as herein set forth, and for the purposes described.

139,012.—*Porcelain Block for Dental Fillings.*—CHARLES H. MACK, New York, N. Y. Application filed January 29, 1873.

A small plate of porcelain is cemented into the cavity of a tooth after it has been nearly filled with gold. Thus a grinding-surface of porcelain is furnished instead of one of gold, and the filled tooth is, to all appearances, an ordinary sound one.

Claim.—Porcelain blocks for dental fillings, when made and used in the manner described.

139,013.—*Rotary Cultivator.*—ROBERT MCKINLEY, Hyde Park, N. Y. Application filed February 7, 1873.

The frame is rectangular. The forward end is supported upon traction-wheels, which, by a system of gears, give motion to a rotary-cylinder harrow. An adjustable transverse blade raises the turf, and the rotating cylinder tears it to pieces.

Claim.—The hoe *a*, and its rock-shaft and links, in combination with the rotating rake I, as and for the purpose set forth.

139,014.—*Elevator-Hatchway Protector.*—JOHN W. MEAKER, Detroit, Mich. Application filed March 19, 1873.

The hatches are hinged on opposite sides of the opening, and part in the center on the approach of the elevator to allow its passage, being actuated by a system of levers operated by a cam-plate on the elevator so as to open in opposite directions, one rising while the other falls. They thus balance each other when moving, and can be operated with but little power.

Claim.—1. The brackets *a a'*, levers *b b'*, provided with the flanges *f f'* and friction-rollers *g g' h h'*, the said levers being pivoted to the bar *d*, which in turn is pivoted to the arms *c c'* on the doors E E', hung in opposite sides of a hatchway, and actuated by a flanged cam-plate, G, on the moving platform D, substantially as described and shown, and for the purpose set forth.

2. The doors E E', hung in an elevator-hatchway so as to open in opposite directions by the cam G actuating a system of levers, substantially as herein described, for the purpose of having one door balance the other, as described and shown.

139,015.—*Fruit-Picker.*—HENRY MEWES, Binghamton, N. Y. Application filed October 24, 1872.

On one side of the rim is an arrangement for attaching the picker to the pole, and on the other side a fork for detaching the fruit.

Claim.—The rim A, provided with the shank, driving-pin, and forked ends, as described.

139,016.—*Car-Coupling.*—BENJAMIN D. MOODY, Darksville, Mo. Application filed May 28, 1872.

The coupling-pin is held above the mouth of the draw-bar by a sliding spring-block, which, being struck by the end of the adjacent draw-head and forced backward, allows the pin to drop into place.

Claim.—The draw-head A having the recess E, with tapering walls and throat *c*, in combination with the weighted link *c c'* and T-shaped block B, operating in a separate recess, and with the spring C and pin D, all constructed and arranged to operate as specified.

139,017.—*Water-Proofing Compound for Canvas and other Fabrics.*—PETER H. MORGAN, Baltimore, Md., assignor to THE GRANITE ROOFING COMPANY, same place. Application filed March 24, 1873.

Gas-tar, North Carolina tar, and prickly-pear tar are mixed together; then sharp sand, calcined and ground clay, and marble-dust are mixed together and sifted into the above. Pulverized asbestus, soapstone, charcoal, and refuse fibers from looms are combined and then incorporated with the above mixture. Sulphur is then added, and then calcined plaster and hydraulic cement. The mass is cooked by slow fire, and the compound, while hot, is spread by machinery over the fabric to be water-proofed.

Claim.—1. The compound herein described, for the purpose substantially as herein set forth.

2. Prickly-pear tar combined with one or more of the ingredients herein set forth, for the purpose substantially as described.

3. The combination, with calcined clay, of the ingredients herein described, for the purpose herein set forth.

139,018.—*Driven or Bored Well.*—JOSEPH EDWIN MORRISON, Willington, Conn. Application filed November 18, 1872.

A valve-seat with a conical base, surrounded by a covering of leather, and a tube whose upper end forms a collar, against which rests the valve-seat.

Claim.—The wedge-shaped valve-seat D, surrounded by the leather H, in combination with the tube A and collar C, constructed and operating substantially as and for the purpose specified.

139,019.—*Paper-Clip.*—THOMAS ORTON, Chicago, Ill. Application filed March 29, 1873.

The inwardly-beveled edge of the clip is serrated so as to hold the ends of the spread sheets, upon which it is clamped tightly by a thumb-screw.

Claim.—1. A paper-clip spring having a serrated beveled edge, substantially as described.

2. The spring *b* having the beveled edge *c*, in combination with the thumb-screw *e* and base *a*, substantially as set forth.

3. A spring with beveled edge, in combination with a base, substantially as shown and described.

139,020.—*Cane.*—MILTON OSBORN, Albion, Mich. Application filed December 31, 1872.

The body of the cane is hollow, into which slides a tubular case, partitioned to receive bottles of medicine. The sliding case is attached to the handle, on which it turns partially around.

Claim.—The combination of the handle A, body B, and case C, the case being relatively secured to the handle as described, and adapted to slide within the body A, and for the purpose set forth.

139,021.—*Folding Seat.*—WILLIAM W. PARKER, Minneapolis, Minn. Application filed October 16, 1872.

A horizontal longitudinal beam is attached to the standards of the settee so as to support the seat when in use, and to which the folding seat is hinged.

Claim.—A portable bench, consisting of two or more standards, A, supporting the horizontal longitudinal beam B, to which the folding or turn-up seat is hinged, in the manner and for the purpose substantially as described.

139,022.—*Thill-Coupling.*—JAMES H. PARKHURST, St. Louis, Mo. Application filed September 13, 1872.

The T-head is eccentric, flattened on one side, and rests upon a rubber cushion. A washer, provided with a projection on one of its ends, serves as a guard to prevent the withdrawal of the thill-head.

Claim.—1. The combination of the thill-iron A, slotted box *m m'*, and cushion *r*, arranged to prevent the escape of the head *t* in a vertical direction, permit its insertion or withdrawal laterally when the thills are elevated, and cause it to compress the cushion by its own eccentricity when the thills are lowered into working position, all as set forth.

2. The open washer *u* having the projection *y*, in combination with the thill-iron A and slotted box *m m m'*, substantially as described.

139,023.—*Casting Ornaments for Sword-Scabbards.*—VIRGIL PRICE, Woodside, N. Y. Application filed March 27, 1873.

The ornaments are cast around the scabbard and afterward removed for the purpose of polishing, and are then replaced and secured.

Claim.—The process, herein described, of forming ornaments on sword-scabbards by casting them directly upon the scabbards, and subsequently removing them therefrom, as set forth.

139,024.—*Clothes-Line Pulley.*—GEORGE H. EYER, New York, N. Y. Application filed October 24, 1872.

Two pulleys, one larger than the other, are placed on two upright axles within a yielding iron frame that is firmly fixed to a wall or post. Opposite are placed similar pulleys, or a common pulley, and over the two an endless line is passed. At the lower ends of the pulleys are India-rubber rings, which, with the iron frame, yield, when the line is revolved, so that the clothes may pass between them.

Claim.—The two pulleys A and B, with India-rubber bands or rings at the lower ends, inserted in a frame fastened to one end or wall, substantially as and for the purpose hereinbefore set forth.

139,025.—*Basket-Form.*—ANTON F. SCOW, Chicago, Ill. Application filed April 2, 1873.

The standards of the basket are held in a position by the wire, and are manipulated for weaving at the opening between I I, which hold the ends of the wire.

Claim.—The combination of the block A, band N, forked standard I I H, provided with one or more anti-friction rollers, G, and bearings P, wire R, and frame-piece K, as and for the purpose set forth.

139,026.—*Whip-Socket.*—ANSON SEARLS, Newark, N. J. Application filed September 30, 1872.

Claim.—1. The straight tubular socket A provided with the projections C and *d*, and incline *e*, constructed and arranged substantially as and for the purpose herein set forth.

2. The fastener, consisting of the perforated part *b'*, loop or hook portion *a'* forming the detachable hinge *d'*, and provided with the set-screw *c'*, substantially as and for the purpose specified.

139,027.—*Wagon-Seat.*—JOHN U. SHULTZ, Shelby, Ohio. Application filed April 18, 1873.

The inner ends of the braces, which connect with the spring-supports, are secured to the ends of diagonally-arranged levers, by means of which compensation of the connecting-rods is effected.

Claim.—The diagonally-arranged compensation-levers *i i*, braces *e*, and cross-pieces *c*, when constructed to operate substantially as shown and described.

139,028.—*Lathe for Turning Wood.*—OTIS S. SMILEY and CHARLES O. SMALL, Augusta, Me.; said SMALL assignor to said SMILEY. Application filed April 15, 1873.

The cutting-chisels are secured in a rotating tool-post, which is itself adjusted in a revolving head.

Claim.—The combination of the head A, the rolling or turning posts B B', the nuts C C', knives D D', slots E E', hollow shaft F, set-screw G G', bushing H, and screw I, all combined and arranged substantially as herein set forth and described.

139,029.—*Box-Lifter.*—BENJAMIN H. SMITH, Ipswich, Mass. Application filed April 11, 1873.

A curved bar provided at its lower end with toothed foot or claw, and at its upper with a stirrup or open handle; also a fork, so secured as to slide up and on down the bar to accommodate different sizes of boxes; also a forked lever, bent at right angles at forked end, the notch fitting closely on the bar, and the arm of the lever passing through the stirrup of the bar.

Claim.—1. The box-lifter, substantially as described, composed of the curved bar *a*, the claw *b*, the handle *c*, and the movable fork *d*, constructed, arranged, and applied together essentially as shown and explained.

2. Combined or for use therewith, as set forth, the bent and notched lever A, as represented.

139,030.—*Lantern.*—THOMAS SMITH, Cleveland, Ohio. Application filed March 10, 1873.

The upper horizontal guard-wire is bent into ears, which pass through rings of two vertical wires, thence above the cap or deflector, where the bail is attached. By this construction the strain is transmitted to the base independently of the cap, and the center of gravity is thrown considerably below the line of suspension.

Claim.—The ring C, consisting of one or more pieces of metal loops or ears, E, formed from a part of said ring C, and extending above the cap or reflector G, in the manner substantially as described, and for the purpose set forth.

139,031.—*Railroad Tie.*—WILLIAM H. STERLING, San Francisco, Cal. Application filed September 9, 1872.

A compound for railroad ties, composed of finely-powd red ashes, about one and one-half part; linseed or cotton-seed oil, one part; asphaltum, sixteen parts; pressed in a mold. Bushings of wood for screws or spikes are inserted while plastic.

Claim.—1. The within-described ingredients for railway ties and permanent ways, when mixed and compounded in about the proportions and manner herein specified and set forth.

2. The employment, in a composition tie, of a plug or plugs of wood, A, provided with threads and countersunk holes C C or upward-projecting head, substantially as and for the purpose specified.

139,032.—*Wheel-Plow.*—CHARLES B. STEVENS, Donnelson, Iowa. Application filed January 16, 1873.

The driver, by throwing his weight on the rear of the frame, tilts it on the axle, thereby raising the heel of the plow so that it may come out of the ground in the same manner that it entered.

Claim.—The frame A B, supporting-wheels E F and sliding seat L, in combination with pivoted plow N, the seat being arranged so that the driver may throw his weight on the rear of the frame to assist in raising the plow, all substantially as described and for the purposes set forth.

139,033.—*Rotary Valve and Cut-Off.*—JOSEPH W. STRANGE, Bangor, Me. Application filed December 5, 1872.

A rotary valve, consisting of a head at each end of a cylindrical chest and connected by a stem, is provided with inlet and outlet ports to admit and exhaust the steam to the opposite ends of the cylinder. Combined therewith is a sleeve on the stem, having a flat disk at each end with openings to cut off the steam from the valve, and operated by a pinion on the sleeve, which meshes into a rack on the end of the stem of the governor and controls the speed of the engine.

Claim.—1. The combination, with the governor and rod J, of the sleeve *e*, with its disks *f*, when constructed and arranged to operate substantially as and for the purposes specified.

2. The combination of the rotary heads *d* and the disks *f*, when constructed and arranged to operate substantially as and for the purposes specified.

139,034.—*Edge-Plane for Trimming the Soles and Welts of Boots and Shoes.*—BENJAMIN J. TATMAN, Philadelphia, Pa. Application filed September 28, 1872.

Two knives are secured by the same screw in a hand-plane, one for trimming the sole, the other for the welt, arranged with a guard for the protection of the upper.

Claim.—The combination of the welt-cutter F with the guard D, provided with the inclined groove *d* and set-screw *b'*, substantially in the manner and for the purpose set forth.

139,035.—*Heating-Stove.*—CHARLES G. THOMPSON, Memphis, Tenn., assignor of one-half his right to ALBERT B. PUSH, same place. Application filed February 7, 1873.

A grate of crescent form embraces one side and the ends of the lower portion of the oval heating-chamber of the stove. A flue, open at its flaring lower end, covers the front and entire upper portion of the stove, and conducts away the products of combustion.

Claim.—1. The combination of the grate *a*, main cylinder or chamber *b*, bed-plate *c*, external jacket *d*, enlargement or mouth d^1, and chamber or passages d^2, *e*, and *f*, substantially as and for the purposes described and set forth.

2. In a heating and cooking stove, the combination of an external grate, *a*, main cylinder or chamber *b*, bed-plate *c*, external jacket *d*, enlargement or mouth d^1, chambers d^2, *e*, and *f*, ovens i^1, dampers or slides i^2, *i*, and i^1, and doors *j* and j^1, all arranged and constructed substantially as and for the purposes specified.

139,036.—*Plow.*—GEORGE B. VAUGHAN, Peoria, Ill. Application filed October 15, 1872.

The axis of the roller is adjustable at its lower end so as to vary the angle. A projection of the mold-board forms a shield for the axis.

Claim.—1. An adjustable plate, in combination with roller D, for regulating its angle so as to facilitate the discharge of weeds or stalks from the plow, substantially as set forth.

2. The combination of the adjustable plate *g*, shield *e*, roller D, standard C, and beam B, substantially as set forth.

139,037.—*Door-Spring.*—MILTON L. WEBSTER, Albany, N. Y. Application filed April 17, 1873.

One end of a spring is attached to the door, and the other to the pivoted end of a crank-lever, which is likewise secured to the door, and arranged about at right angles with it. A draw-bar is securely fastened one end to the top of the door-frame and the other to the outer end of the crank-lever, at an acute angle with the same, being arranged a little back of the pivot of the lever and toward the edge of the hinged stile of the door. Under this construction the opening of the door, drawing on the crank-lever, increases the tension of the spring, and the draw-bar, up to a certain point, operates to close the door; but when the door is set wide open the same devices hold it in that position without removal of the spring.

Claim.—The device for closing a door, consisting of the crank-lever C pivoted to the door at about right angles with the same, and the draw-bar E pivoted at one end to the door-frame, and its opposite end to the outer end of the lever C, and at an acute angle with the same, and the spring G attached at one end to the door, and its other end to the pivoted ends of the lever C and draw-bar E, with or without the link F, substantially as and for the purpose set forth.

139,038.—*Machine for Stretching and Drying Cloth.*—WILLIAM BAILEY, Brooklyn, assignor to GEORGE B. SLOAN, Oswego, N. Y. Application filed December 13, 1872.

During the movement of the chains the rollers of the sheaves are caused to act, those of one line on the upper and those of the other line on the under guide-rail, and the strain on the chains is in a line with the center of the sheaves.

Claim.—The combination, with the endless carrier-chains and the tracks above and upon which they move between the drums, of the flanged side guide-rails and the sheaves attached to the exterior opposite faces of the carrier-chains in a line coinciding with the line of draft of the tenter-hooks, and independent single-flanged rollers, (two for each sheave,) formed and arranged therein, as described, to engage said guide-rails, substantially in the manner and for the purposes shown and set forth.

139,039.—*Dental Drill.*—JONATHAN W. BAXTER, Vevay, Ind. Application filed February 1, 1873.

The drill is rotated by a pitman-crank which is worked by the thumb of the operator. The pitman is at its upper end connected to a pawl. A coil-spring is placed just below the thumb-rest.

Claim.—The combination of the worm E, driving-wheel F, a pawl mechanism, and a retracting-spring with the drill-spindle A of a hand dental drilling-machine, substantially as specified.

139,040.—*Sewing-Machine.*—EUGENE W. BERRE, Evansville, Wis. Application filed March 29, 1873.

The feed-plate is at the end of a bent arm pivoted to a reciprocating bar operated by means of a vibrating lever engaging lugs on the bar, and the feed-plate is raised by means of the rock-stand; also connected to the vibrating lever.

Claim.—The combination of a bar, D, feed-plate A, lugs G F, and rock-stand H with the feed-plate D, link L', and the lever E, as and for the purpose described.

139,041.—*Lifting-Jack.*—WILLIAM A. BRUNKER, Farmersburg, Ind. Application filed January 10, 1873.

A hinged lever connected by stirrup to a lever pivoted on an upright frame, to which first lever is hinged, the pivoted lever having a self-locking device, consisting of a keeper on one side, which engages with a ratchet-bar secured to the standard of the lifter.

Claim.—The combination of the hinged lever D and stirrup E with the pivoted lever A'' and a locking device, B, substantially as shown and described, to operate as specified.

139,042.—*Stock for Drilling or Tapping Instruments.*—GEORGE BUNCH, Bonnot's Mill, Mo. Application filed March 8, 1873.

A trunnion, having sockets in each end, is turned by means of a large gear situated below upon a hand-crank shaft, which meshes with a pinion midway on the trunnion. One of these sockets can be used as a wrench to take off and put on nuts, while the other is adapted to receive a die or tap, whereby the device may thread bolts or nuts.

Claim.—1. The double-socketed trunnion F, arranged to rotate in a frame, as and for the purpose specified.

2. The trunnions F, in combination with the pinion *b*, cog-wheel *d*, crank E, prongs C, and pieces D of frame A, for the purpose of loosening and tightening nuts and threading nuts and bolts, substantially as described.

139,043.—*Machine for Entering Blind-Slats.*—JAMES CHURCH, St. Louis, Mo. Application filed October 30, 1872.

The slats are adjusted regularly in the notches of the frame, which are made to conform to the mortises on the stiles.

Claim.—The combination and arrangement of horizontal bars A B with inclined planes or faces *a b*, shoulders *a' b'*, and cross-bar C, as and for the purpose set forth.

139,044.—*Sample-Holder for Displaying Boots, &c.*—JACOB CLOES, Decatur, Ind. Application filed March 22, 1873.

The V-shaped foot gives a firm base to the holder and allows a rigid connection to the boxes; the guard secures the return of the clamp to its proper place, so that the clamp-bar cannot be bent or work loosely.

Claim.—The sample-holder B, of wire, having clamp ends *c*, spring *a*, foot *b*, and guard *d*, substantially as and for the purpose described.

139,045.—*Medical Compound.*—JOHN CONKELMAN, St. Louis, Mo. Application filed August 9, 1872.

Glycerine, concentrated lemon extract, oil of sassafras, alcohol, carbolic acid, muriatic acid, tincture ledum palustre, pulverized citric acid.

Claim.—The medical compound composed of the ingredients above described, in or about the proportions set forth.

139,046.—*Railroad-Switch Signal.*—JOHN CULLEN, Oxford, Miss. Application filed February 21, 1873.

Two reflectors attached to the switch-lever at different heights serve to show to the locomotive-driver the position or direction of the said lever to considerable distance at night by means of the illumination from the head-light.

Claim.—1. The reflectors G, two or more, in combination with the lever A, as and for the purpose specified.

2. In combination with the reflectors G, the bar H, hinge J, and clamp I, or their equivalents, as and for the purposes described.

139,047.—*Stove-Polish.*—JACOB L. DANFORTH, Newburyport, Mass. Application filed April 9, 1873.

Two parts of powdered copperas, one part pulverized bone-black, one part black lead, by weight, and mixed with water to the consistency of cream.

Claim.—The herein-described enamel for polishing stoves, &c., compounded of the ingredients specified, substantially as set forth.

139,048.—*Eyeleting-Machine.*—ALFRED DAWES, Hudson, assignor to HENRY ELMER TOWNSEND, Boston, Mass. Application filed January 9, 1873.

The machine is operated by cam mechanism. The levers actuating the plungers are pivoted in sleeves below their fulcrums so that they may have both a lateral and a reciprocating vertical movement. The head-block slides in a groove, and by its motion gives the plungers their the lateral movement. It is adjustable by the connecting-rod and lever. The setting-anvil rests upon a spiral spring, and a guide-post passes through a slot in the bed-plate, and is made movable by a retracting spring underneath the lid.

Claim.—1. The lever B having the joint *b* and the sleeve D.

2. The lever B jointed below the fulcrum so as to be capable of being moved laterally and vertically.

3. The sliding block I with the plates G and G′, and the plungers E and F.

4. The sliding block I with the plates G and G′ and the plungers E and F, in combination with the jointed levers B and C.

5. The adjustable connecting-rod J, in combination with the sliding block I.

6. The adjustable connecting-rod J, in combination with sliding block I and the lever K.

7. In an eyelet-setting machine, a setting-anvil resting upon a spring.

8. The guide-post V upon the slide *r*, in combination with a retracting spring.

9. The movable guide-post V.

10. In an eyeleting-machine, the jointed levers B and C; the adjusting-plate G; the adjustable connecting-rod J, in combination with the adjustable lever K or other device for actuating the feed.

11. In an eyeleting-machine, a movable guide-post.

139,049.—*Stucco Cornice.*—ANDREW DERROM, Paterson, N. J. Application filed January 6, 1873.

Cornices of stucco or plaster of Paris are molded upon a frame of rods so as to be portable. They are attached to their places by screws, or in any convenient manner, the screw-heads being afterward covered.

Claim.—The rigid frame A arranged within cornices, panels, or other ornaments of plaster or equivalent material, substantially as set forth.

139,050.—*Mold for Forming Building-Blocks.*—ANDREW DERROM, Paterson, N. J. Application filed January 6, 1873.

A large or concrete block is formed in a jointed mold on a "face"-piece. After "setting" a while the mold is turned so as to bring the false bottom below the molded block and opened out. The block is now removed by and on the false bottom for drying, and the operation repeated.

Claim.—The face-piece *a* and false bottom *b*, combined with the hinged sides, constructed as shown and specified, for the purpose described.

139,051.—*Spinning-Mule.*—JOHN J. DEWEY, Queechee, Vt. Application filed February 15, 1873.

The gearing is to enable the operator, after a set of cops has been completed, to run the carriage in slowly by hand, instead of pushing directly against it, so that he may at the same time, by means of the lever on the follower, direct the yarn lower down on the spindles than it would be possible in the ordinary operation of the self-acting devices, so as to wind several layers about the spindles to form a packing for holding the new bobbins, which are to be applied in place of the full ones.

Claim.—1. The combination, with a spinning mule or jack, of a band-crank and reducing-gearing, arranged substantially as described, and adapted for running the carriage in by hand when the driving-belt is thrown off, substantially as specified.

2. In a spinning mule or jack having gearing for running the carriage in by hand, as above described, a lever, K, combined with the follower-rod L, substantially as specified.

139,052.—*Compound Steam-Engine.*—CHARLES E. EMERY, New York, N. Y. Application filed November 9, 1872.

Arranges rocking valves in the heads of an annular compound engine, by which the ports are shortened. Also connects the valves through a universal joint with its spindle.

Claim.—1. In an annular compound engine, the combination with and arrangement in or upon the cylinder head or bottom of one or more valves, regulating the admission or release of the steam to or from the interior cylinder, substantially as and for the purposes specified.

2. In an annular compound engine, one or more valves arranged in or upon the cylinder-heads, as described, and operated in whole or in part from the valve-operating mechanism of the outer cylinder, substantially as set forth.

3. The combination of a rocking or circular valve with its spindle through a universal joint, substantially as and for the purposes specified.

139,053.—*Spark-Arrester.*—EUGENE FONTAINE, Fort Wayne, Ind. Application filed April 17, 1873.

The smoke is deflected by a curved cap or plate into a double cone-shaped chamber with a deflector across its upper opening and one near the bottom. The latter stops the downward currents. A rim descending and a wire-gauze prevent the escape of cinders, which fall to the bottom of the chamber and are carried off by a pipe.

Claim.—1. The combination of the smoke-stack, the deflecting-cap with curved top, the smoke-chamber with wire-gauze cover and hopper-shaped bottom having no opening in the inclined side opposite the smoke-stack, and the escape-flue for the cinders, all constructed and arranged to operate substantially as described.

2. In combination with the deflecting-cap B, the smoke-chamber C, and escape-flue D, the hinged cinder-box E, constructed and arranged to operate substantially as described.

3. In combination with the adjustable curved plate *b* of the deflecting-cap and the smoke-chamber C, the deflecting-plate I′, in said chamber.

4. In combination with the deflecting-cap with its curved plate *b*, and the smoke-chamber with its hopper-shaped bottom having no opening in the inclined side opposite the smoke-stack and discharge-flue, the deflecting-plate J, arranged to operate substantially as described.

5. In combination with the deflecting-cap B and smoke-chamber C, the annular conical flange I, substantially as and for the purpose described.

6. In combination with the escape-pipe D and hinged cinder-box E, the flexible and detachable joint *e*, substantially as described.

139,054.—*Nut and Coffee Roaster.*—D'ALEMBERT T. GALE, Fort Wayne, Ind. Application filed December 9, 1872.

There are connected with the roasting-cylinder an escapement-wheel, pendulum, &c., in combination with spring-driving mechanism, whereby an intermittent rotary motion is given to the cylinder. When the springs are wound up the cylinder revolves in the reverse direction.

Claim.—In a nut and coffee roaster, constructed as described, the driving mechanism *b p* and pendulum attachment F *m n o*, arranged in relation to the roasting-cylinder B in such manner that the several springs are wound up by a single movement of the shaft C, whereby, also, the contents of the cylinder are given reverse motion, substantially as and for the purpose specified.

139,055.—*Governor.*—ROBERT W. GARDNER, Quincy, Ill. Application filed February 1, 1873.

A stop-motion, by which the valve is closed, when the belt breaks, consists of a rotary frame and supporting weight-lever fulcrumed in a vertical slide supported on a tapering arm, that is itself held in position by the strain of the belt, and when said belt breaks the valve closes. The valve-seat has a central stem and rests on a rebate in the shell, and is held to its place by a spider and reverse ring on the under side and nut screwed onto the stem. The face of the valve and guide are held to the valve by a clamp and nut on the guide.

Claim.—1. The combination, with valve-rod E, of the rotary frame I and supporting weight-lever F fulcrumed in a vertical slide supported on a tapering arm that is itself held in position by the strain of the belt, substantially as and for the purpose described.

2. The valve-seat *a* having stem *d*, and resting on rabbet of casting combined with a spider, *b*, fitted on a reverse rabbet of said casting, and a nut, *c*, applied as and for the purpose described.

3. A face, *f*, and a guide, *i*, secured to valve A by the same clamp *g k*, as described.

4. A valve, A *f*, having guide-pin *i* combined with a valve-seat, *a*, having socket *d*, as and for the purpose set forth.

139,056.—*Dyeing Madder Colors.*—FREDERICK A. GATTY, Accrington, England. Application filed April 14, 1873.

The cloth or yarn is first printed or otherwise prepared with the mordant, and the fatty acid combined therewith afterward, taking the place of the operation commonly called dunging.

Claim.—The improvement in the art of coloring cotton fabrics and yarns by treating with neutral soap or emulsions of fatty acids, or of oils or fats, either saponified or in their natural state, or the two combined, in the manner and for the purpose described.

139,057.—*Knife-Cleaner.*—TIMOTHY GINGRAS and LOUIS GINGRAS, Buffalo, N. Y. Application filed March 22, 1873.

A box with a drawer, above which is placed a divided-hinged board in two parts, with their inner surfaces covered with leather, with a cover which extends down to inclose the devices and form the box, which is inclosed in a frame into which it slides, and may be detached or suspended upon the wall by screws.

Claim.—The stationary outer case A, the inner movable box B, the drawer *a*, the superposed leather-lined and divided board *d e*, the leather-lined lid *f*, and the cover C, combined, constructed, and arranged as and for the purpose described.

139,058.—*Heeling-Machine.*—CHARLES W. GLIDDEN, Lynn, and HADLEY P. FAIRFIELD, Boston, assignors to JAMES W. BROOKS, trustee, Boston, Mass. Application filed April 19, 1873.

The carriage supporting the cutters is reciprocated around the curved part of the heel automatically upon a stationary plate, in which are two pattern or guide grooves, into which pins from the carriage project, the pins keeping the cutters at a proper angle along the curved edge upon or to be produced upon the heel. The nailing and turning mechanism operated by compressed air.

Claim.—1. The plate *k*, made with the two grooves, *p q*, for controlling the presentation of the cutting mechanism, substantially as described.

2. In combination with the boot-holding mechanism and the guide mechanism for controlling the movement of the cutting mechanism, the reciprocating rotary cutter and its bearings a^3 and guides e^3 x^3, all arranged substantially as shown and described.

3. The cutter z^2, having the adjustable guide A^3, arranged substantially as shown and described.

4. In combination with a boot-holding and heel-nailing mechanism, a trimming mechanism automatically reciprocated by means substantially as described.

5. In combination with the boot-holding and heel-nailing mechanism, the trimming mechanism driven by the belts and wheel and crank-connections, substantially as shown and described.

6. In combination with the trimming mechanism and the nailing mechanism, the wheel z^3, thrown into and from connection with the driving-wheel f^6 by means substantially as shown and described.

7. The heel-nailing mechanism and the heel-trimming mechanism, actuated directly and indirectly from the driving-shaft e^4 by means substantially as described.

8. In combination with the nailing mechanism, the piston-cylinder g^3, piston f^7, valve-chest A^3, valve or valves n^3, and tank p^3, substantially as described.

9. The last a^3, made with the yielding toe-piece pressed forward by the spring and jointed, substantially as shown and described.

10. The combination and arrangement, substantially as shown and described, of the nailer-rod e^3, piston f^7, cylinder g^3, ports, valves, and valve-chest, tank p^3, pump p^4 and its piston, connecting-rod q^4, crank-wheel r^4, and driving-shaft e^4.

11. In combination with the nailing mechanism actuated by the piston f^7, the valve mechanism operated by the foot-levers, substantially as shown and described.

12. In combination with the wheel r^3, the brake g^4 and the mechanism for effecting the rise and release of the wheel, substantially as shown and described.

139,059.—*Wheel-Plow.*—ISAAC B. GREEN, Gillespie, Ill. Application filed March 15, 1873.

The guide prevents lateral movement of the plow.

Claim.—The pendent standard K and guide Q, arranged under the axle, in combination with a two-barred plow-beam, as and for the purpose described.

139,060.—*Detachable Boot and Shoe Tip.*—MICHAEL R. HANLEY, Providence, R. I. Application filed January 6, 1873.

The tip is made of spring-metal, having teeth at right angles to its vertical plane. Two of the teeth are hook-shaped, and when the tip is applied between the sole and upper of a shoe they engage on pins or hooks in the sole.

Claim.—The metallic shoe-tip A, provided with the lips or teeth B, and the hook-lips C C on its lower edge, as shown and described.

139,061.—*Mail-Bag.*—THOMAS J. HARDAWAY, Macon, Ga. Application filed March 22, 1873.

Claim.—As the improvement in mail-bags, hereinbefore described, the locking label-piece C *g*, attached to one of the four-hinged bars near the joint B by means of loop-wire loop *f* and staple *e*, and the slots *b′ d′* and staples *b* and *d*, all arranged as specified, whereby said piece is adapted to cover the joint and lock the bars together, as shown and described.

139,062.—*Cotton-Worm Destroyer.*—JACK. HELM, Hochheim, Texas, assignor to himself and CHARLES TIM, same place. Application filed November 16, 1872.

An insect-destroyer mounted on two driving-wheels. Over these wheels and receiving motion therefrom is pivoted a shaft provided with jointed brushes. In the rear of the rotary brushes are secured stationary brushes, which receive the insects knocked from the cotton-plants by the rotary brushes, and from thence down to the earth, where they are covered with earth by means of jointed bottoms. The inside joints are each provided with a share. The jointed bottoms accommodate themselves to the side-hill.

Claim.—1. The frame A, lever B, wheels C, boards *a a*, and wings *e f*, combined with each other, and arranged to operate substantially as set forth and specified.

2. The jointed bottom *a e f*, and brushes E relatively arranged on a frame of the machine, as and for the purpose described.

3. The brushes F F, arranged, in combination with the rotary brushes E, on the frame of a cotton-worm destroyer, as set forth.

139,063.—*Reversible Street-Car.*—WILLIAM T. JENKS, Toledo, Ohio. Application filed April 19, 1873.

A flat metallic ring, having its sides depressed, is secured to the under side of the car-body, and is supported by rollers which are arranged at the sides of the truck; the car-body, when reversed, is thus raised clear of the wheels.

Claim.—The circle E, the flanged segment F, the rollers G, and the guard D, in combination with the car-body A, truck-frame B, and king-bolt C, substantially as herein shown and described.

139,064.—*Ruffler and Gatherer for Sewing-Machines.*—ALLEN JOHNSTON, Ottumwa, Iowa. Application filed February 18, 1873.

The piece to be ruffled is placed between the holding and separating-plates. The gathering-blade engages it beyond the end of the separating-plate, and the position of the latter determines the fulness of the ruffle. The gathering-blade is not slotted as usual for the passage of the needle, and it is drawn back through the lever and link just as the needle commences to descend.

Claim.—1. The vibratory lever, deriving a positive motion in both directions from the needle-bar, and the reciprocating gathering-blade jointed to said lever so as to move back upon commencement of the downward movement of the needle-bar, in combination with an upper slotted stationary holding blade or plate, and an intermediate adjustable separating-plate, the said holding-blade being arranged with its edge in advance of the separating-plate to hold the gather when the gathering-blade recedes before the needle enters the cloth, said parts being arranged for joint operation, as set forth.

2. The separator-plate, supported and arranged to slide on the frame of the attachment, substantially as described, in combination with the adjusting cam or eccentric pivoted to the frame and working in a recess in the said plate, substantially as and for the purposes set forth.

3. The holding-plate and false foot, carried by an arm pivoted or hinged to the frame, as described, in combination with the reciprocating gathering-blade, substantially as shown and set forth.

139,065.—*Harrow.*—THOMAS M. KING, Murfreesborough, Tenn. Application filed January 6, 1873.

Two harrows, the frame of each being formed of a straight bar and a semicircular bar, and attached to a beam by bolts so as to be adjustable at various angles to each other.

Claim.—The improved harrow, consisting of the two like parts, each formed of a straight bar, D, perforated semicircular bar F, central brace-bar G, and teeth E, attached to the beam A by two adjusting bolts, *f*, as shown and described, whereby they may be set at various angles to each other horizontally, and adjusted so as to leave a wide or narrow space between them at their front ends, as specified.

139,066.—*Chandelier.*—JOSEPH KINTZ, West Meriden, assignor to JOSEPH KINTZ, Meriden, and P. J. CLARK, West Meriden, Conn. Application filed November 30, 1872.

The top plate, which holds the arms in place, is swiveled upon a nut which moves on the screw-threading tube placed upon the central rods. The ornamental tube surrounding central rod need not be disturbed while adjusting the arms.

Claim.—1. The combination of the screw H and the nut F with the rod A and the top D of the center-piece, the screw H being secured to the rod and the nut F swiveled to the top D, substantially as specified.

2. The ornamental tube K, screw H, and nut F, arranged in such manner that the nut can be raised and lowered to connect and disconnect the arms without disturbing said tube, substantially as specified.

139,067.—*Sewing-Machine.*—LEMBRUS W. LATHROP, Philadelphia, Pa., assignor to LATHROP COMBINATION SEWING-MACHINE COMPANY, New York, N. Y. Application filed October 19, 1872.

The oscillating looper first carries the loop of needle-thread across the path of the spool-case, then the revolving looper engages the loops so distended and draws down its lower portion when the spool is passed through, and, in the continued rotation of the hook, the thread-guide, and bulged plate control and deliver the loop. The shifting pin is allowed to project through the plate when it is desired to retain the loop to form a chain or interlocked chain-stitch instead of the lock-stitch. The machine-plate is hinged to swing away from the throat-plate to gain access to the working parts.

Claim.—1. The combination, with the needle and spool-carrier, of the oscillating looper I and revolving looper O, the latter having the thread-guide U^3 and bulged plate U, substantially as specified.

2. The combination, with the oscillating looper, revolving looper, thread-guide, and the bulged plate, of the shifting pin *a* and plate Y, for making the chain-stitch, substantially as specified.

3. The arrangement of the driving-shaft D, oscillating looper, revolving looper, pendulum, wrist-pin, and feed-cams, substantially as specified.

4. The top of the case, composed of the fixed parts *t′* and hinged parts *u′* and *v′*, substantially as specified.

139,068.—*Apparatus for Detaching Horses.*—HEZEKIAH LATSHAW, McKnightstown, Pa. Application filed March 14, 1873.

By means of the strap the slides are drawn toward each other, and the inner ends of the catches are released so that the traces may be drawn over the cockeyes as the horse leaves the shafts.

Claim.—The combination of the levers C C, pivoted to the ends of the whiffletree, and having cockeyes on their outer ends, the boxes *a a*, and the angular and slotted slides *e e′ a a′*, all constructed as and for the purposes set forth.

139,069.—*Screw-Driver.*—CHARLES LAW, Pittston, Pa. Application filed April 30, 1873.

Claim.—As a new article of manufacture, a screw-driver having a self-adjusting or swinging end or bit pivoted to the blade, substantially as shown and described.

139,070.—*Compound Steam-Pump.*—ARTHUR J. L. LORETZ, Brooklyn, N. Y. Application filed July 22, 1872.

Two vertical high and low pressure steam-cylinders with pistons, chests, and valves are connected to a horizontal crank-shaft. The lower part of said cylinders form the pumps, with inlet and outlet valves. The hollow plunger forms a valve, at its top seating on a piston, which is held by friction in the enlarged upper portion of the cylinders, and has another valve in its lower end. Steam being admitted, the hollow plunger rises until the piston strikes the head and opens the lower valve, allowing steam and vapor to pass through and to be condensed. The water is forced out by the downward stroke.

Claim.—1. The combination of the cylindrical pump-chambers A^3 and B^3, steam-chambers A and B with the hollow plunger K, high-pressure compartments C C′, and low-pressure compartments L L′, arranged substantially as shown, and for the purpose set forth.

2. The combination of the valves P and U and hollow plunger K with the chambers B B^3, constructed and arranged for operation substantially as shown, and for the purpose set forth.

3. The combination of the chambers A A^2 B B^3 forming compartments L L′ C C′, the plungers K, and valves P U with inlet-valves G and outlet-valves Q, all arranged as and for the purpose set forth.

139,071.—*Compound High and Low Pressure Steam-Pump.*—ARTHUR J. L. LORETZ, Brooklyn, N. Y. Application filed October 9, 1872.

Steam passes into stationary chest, flows through tube, enters upper chamber, raising the combination piston, and causing valve to close passages to upper low-pressure cylinder, the steam previously used escaping into side vacuum-chamber, the high-pressure steam in lower chamber passing through apertures in compound piston into lower low-pressure cylinder, the lower valve opening the ports for this purpose. Valve and steam chest is given an initial movement by piston operating tappets thereon, the lower valve is closed thereby, the upper is opened; equilibrium

in chamber being thus destroyed, steam valve opens to full width, and piston descends.

Claim.—1. The arrangement of the pistons G^1 G^2 in their cylinders A and B, connected by tubular piece H, the partition Q of the vacuum and pump chamber C, the steam-chest I^1 I^2, and chambers N^1 N^2, M^1 M^2, and L^1 L^2, all constructed to operate substantially as and for the purpose set forth.

2. The combination of the double valve R, its packing and spring rings, the tubes J^1 J^2, with the cylinder N^1 N^2 and M^1 M^2, all arranged substantially as shown and for the purpose specified.

3. The combination of the annular valve U, provided with packing-rings, with the double valve R, arranged substantially as shown, and for the purpose described.

4. The combination of the steam-chests I^1 I^2, having grooves F^1 F^2 and packing, with the double valve O, tappets Y, connecting-tube H, tubes J^1 J^2 secured to cylinders A and B, and suitable openings, substantially as and for the purpose herein described.

5. The cylinders A B bolted with flanges D^1 D^2 to the chamber C containing the suction and delivery rollers, in combination with the pistons G^1 G^2, passages S T, tube H, double valve R, annular valve U, steam-chest I, valve O, and tubes J, all arranged substantially as and for the purpose specified.

139,072.—*Milk-Boiler Alarm.*—SAMUEL MANGOLD, New York, N. Y. Application filed December 14, 1872.

The vessel for containing the milk to be boiled supports a standard, on which a bell is hung by an oscillating frame so as to be rung when allowed to fall by a suitable limiting slot. A small floating vessel within the larger one is pivoted to the standard by an arm carrying a detent pin, and is depressed so as to release the bell and give the alarm, when the ebullition of the milk causes it to overflow into the smaller vessel.

Claim.—1. The bell F, applied to the plate E, having a zigzag slot, and serving as an alarm attachment to milk-boilers, as set forth.

2. The vessel D applied to the pivoted arm C, which carries the pin *g* to lock the slotted plate or shank E of the bell, as specified.

3. The combination of the adjustable shank *b* and plate B with the pivoted arm C, vessel D, slotted plate E, and bell F, all arranged to operate substantially as herein shown and described.

139,073.—*Sacking Attachment for Thrashing-Machines.*—WALTER MASTERTON, Stockton, Cal. Application filed February 6, 1873.

Sacks suspended clear of ground and properly stretched while being filled by griping attachments, which are adjustable to accommodate sacks of different sizes, and so arranged that the sacks cannot be torn. An automatic vibrating lever striking blows in rapid succession against the bottom of the sack to assist in filling the whole bottom of the sack.

Claim.—1. The griping attachment, consisting of the transverse shafts A A with their griping-plates *i i*, lever-arms *j j*, and operating-levers *p*, in combination with the stationary vertical plates *s m*, when said plates are provided with a yielding or ribbed surface, substantially as and for the purpose above described.

2. The adjustable rack-bars *k k* with their movable sack-griping attachment, in combination with a stationary griping attachment upon the opposite side of the opening *d*, substantially as and for the purpose above described.

3. The vibrating lever R, substantially as and for the purpose above described.

139,074.—*Seed-Drill.*—ELBRIDGE G. MATTHEWS, Oakham, Mass. Application filed February 21, 1873.

Claim.—1. In combination with the hopper, the plunger, having an automatic, positive, and intermittent downward movement to carry its foot into or toward the delivery-orifice, substantially as described.

2. In combination with the hopper and delivery-orifice, a plunger shod with rubber or rubber compound, substantially as described.

3. In combination with the hopper and conductor, the gage-disk *n* placed upon the flange e^2, which forms an integral part of the conductor, and is fastened to the frame between the hopper and conductor, substantially as described.

4. In combination with the sowing mechanism, the coverer, formed with the converging blades *t*, having the shoe *u*, substantially as described.

5. The markers *z* formed with the radiating blades a^2, substantially as described.

6. The conductor *p*, cast with the flange e^2, for sustaining the hopper and gage-plate, and uniting the handles *d* and arms b^2, substantially as described.

139,075.—*Straw-Feeding Attachment for Furnaces.*—DAVID MOREY, Watsonville, Cal. Application filed February 17, 1873.

A removable spout is provided with a hinged valve which closes against the external air, when the straw is forced or fed into the furnace.

Claim.—The removable tube or funnel A, having arranged within it the diagonal valve with its lower edge turned up, in combination with a furnace, as set forth.

139,076.—*Turning-Lathe for Wood.*—ANDERSON R. PARK, Columbia, Texas. Application filed July 30, 1872.

The material is placed between revolving centers, which are secured upon a sliding bed, and is cut to the required shape by a rotating cutter guided in its movements by a guide-wheel and pattern.

Claim.—1. The combination, in a lathe for turning irregular forms, of a pattern, O, for the sides of the saddle, constructed as described, a carrier-plate, P, and suitable plates or holding devices M S, substantially as specified.

2. The combination, with the carrier *h*, of the steady-pins *k* and the lever *l*, substantially as specified.

3. The combination, with the feed-screw and the slide D, of the divided nut O' P', lever Q', double dog R', and racks S', substantially as specified.

139,077.—*Wire Mattress.*—EMERY PARKER, New Britain, Conn. Application filed March 1, 1873.

Triangular springs are connected alternately at their base and points and attached to coiled loops, which are suspended from the end bars.

Claim.—1. A bed-bottom formed from a series of triangular links, A C, connected alternately at their base and points, and combined with a spring or springs to impart the necessary elasticity, substantially as set forth.

2. The herein-described spring for bed-bottoms, consisting of a pair of coiled loops, E F, united at their ends to form a combined spring, substantially as described.

139,078.—*Manufacture of Sugar.*—AUGUST F. W. PAETZ, Oakland, Cal. Application filed March 1, 1873.

After sugar has been refined in a centrifugal machine it is subjected to a solution of dextrine to render it adhesive, after which it is pressed into cubes.

Claim.—The application of a solution of dextrine to granular sugar in a centrifugal machine, substantially as and for the purpose herein described.

139,079.—*Hand-Punch and Cutting-Nipper.*—JOHN O. REILLEY, Jersey City, N. J., assignor of one-half his right to HENRY M. MARTIN, New York, N. Y. Application filed August 16, 1872.

The punch is arranged at the side of the jaws opposite to the cutters, so that the shoulder on one die or punch, coming in contact with the top of the sleeve of the other, forms a stop for the knives and prevents their edges from injury.

Claim.—The arrangement of the cutting nippers and punch relatively to each other, whereby the latter forms a stop for the former, substantially as and for the purpose set forth.

139,080.—*Chimney-Cowl.*—JOSEPH H. RICHARDSON, Philadelphia, Pa., assignor of one-half his right to DAVID HARDIE, same place. Application filed September 30, 1872.

The wind enters the ventilator and surrounds and moves parallel with the sides of the inner cylinder.

Claim.—The combination of the outer cylinder A, provided with the openings C, D, and E, with the inner cylinder F, closed at the upper end, and provided with openings G G, adapted to operate substantially in the manner as herein shown and described.

139,081.—*Jelly-Glass.*—DANIEL C. RIPLEY, Pittsburg, Pa. Application filed April 30, 1873.

Claim.—1. A jelly-glass, having a base and lip of such shape that the same may be used in forming a pile of similar glasses, in which the base of each glass forms a cap or lid for the next lower one, substantially as and for the purposes described.

2. A pile or column of jelly-glasses, arranged one above the other, the base of each glass forming the cap or lid of the glass directly under it, the glass at the apex of the column being closed by any suitable detached lid, substantially as and for the purposes described.

3. As a new article of manufacture, a jelly-glass, the diameter of which exceeds the height, substantially as described.

139,082.—*Door-Check.*—GEORGE E. RITTENHOUSE, Akron, Ohio. Application filed April 12, 1873.

A metallic plate with notched circular flange is attached to the inside of the door near the knob and casing. A short lever, having at one end a button or knob, is pivoted centrally to this plate, the knob end being slightly bent up to pass freely over the notches, a pawl being applied at its lower side. At the opposite end of this short lever is pivoted a long rod or bolt, which slides in a guide-staple near the bottom of the door, and has rubber capping attached to its floor end. There is also a bolt-hole in the floor—the device operating either as a positive fastening or as an adjustable check to hold the door at any desired angle or position.

Claim.—In combination with the plate B, provided with a toothed circular flange, *a*, the lever C pivoted thereto at *d* and having the catch *c*, and the rod D with capping *h*, all arranged to operate as specified.

139,083.—*Manufacture of Gas.*—FREDERICK A. SABBATON, Troy, N. Y. Application filed April 27, 1873.

To save fuel, the tarry deposit in the hydraulic main is utilized by means of a tube or siphon, which conducts the deposit to a steam-injector plated beneath the retort and communicating with the fire-box. A funnel-shaped pipe surrounds the injector, and has its outer end closed by a slotted disk to regulate the amount of air admitted to the upper part of the fire-box.

Claim.—1. The combination of a steam and air injector with the hydraulic main and tar-conveying tube for feeding the contents of the hydraulic main to the furnace, as set forth.

2. The air-register *f* applied to the perforated face of the box *e*, in combination with the tube *g* and pipes *a b*, as specified.

139,084.—*Self-Measuring Oil-Tank.*—JACOB SCHALK, Jr., Guttenberg, N. J. Application filed January 6, 1873.

A measuring-chamber beneath the tank is filled, when desired, through a valve connected with a lever, which is operated by rod passing down through the top or cover of the tank and connecting outside with a crank. The kerosene or oil is drawn from the measuring-chamber by a faucet in the usual way.

Claim.—The crank W, reciprocating frame U V T, and lever mechanism R M P O, arranged in connection with the receptacle and valve mechanism, as and for the purpose specified.

139,085.—*Filter for Water-Coolers.*—CHARLES SCHNEIDER, Newark, N. J. Application filed April 26, 1873.

Filter so constructed that the impurities contained in the water may be excluded.

Claim.—1. The water-cooler filter C, having conical spout B', detachable top D, and adjustable legs *f*, substantially as and for the purpose described.

2. The combination of filter C with faucet B and cooler A, to produce filtering of all the water drawn off, as set forth.

139,086.—*Wagon-Brake Shoe.*—HENRY SEITZ, Palmyra, Mo. Application filed March 22, 1873.

The sections of the brake-shoe are securely held by means of a clamp against the serrated edge of an adjustable plate, which is secured to the brake-bar.

Claim.—1. The brake-bar A, having the slot *a'* and the stirrup or link B arranged therein, as shown and described.

2. The stirrup or link B, the plates E, and the blocks C, in combination with the bar A having the slot *a'*, substantially as herein shown and described, and for the purpose set forth.

139,087.—*Adjustable Reamer.*—ALFRED SHEDLOCK, New York, N. Y. Application filed August 7, 1872.

A tapered mandrel, rectangular in cross-section, is inclosed by two grooved blocks having cutting-edges, held together and to the stock by screws that pass through all. A feed-screw inserted axially in the end of the stock, and a nut through which it passes project into each block and serve to adjust the blocks upon the tapered mandrel.

Claim.—1. The two blocks *b* and *b'* having the cutting-edges formed thereon, capable of being adjusted on the body of the reamer *a*, constructed and operating substantially as described.

2. The screw *d* and nut *e*, with its screws *e' e'* and nuts, in combination with the blocks *b* and *b'* and body of the reamer, substantially as described.

3. The adjustable reamer, as before claimed, in combination with the collar A, forming the steady-pin when it is desired to use the tool as a counter-bore.

139,088.—*Manufacture of Umbrella-Stretchers.*—JOSIAH SHEPARD, New Britain, Conn. Application filed December 27, 1872.

The superior stiffness and elasticity imparted to the stretcher by hammering warrants, it is said, the use of lighter wire than would otherwise be required.

Claim.—As an article of manufacture, the herein-described stretcher for umbrellas, tempered or made elastic from the center toward each end by the process of hammering or pressing, substantially in the manner described, from the center toward each end.

139,089.—*Ruffler and Gatherer for Sewing-Machines.*—FREDERICK SIEVERS, Fort Wayne, Ind., assignor of one-half his right to WILLIAM H. HILDEBRANN, same place. Application filed March 20, 1873.

The spring-plate which bears on the material and moves it to form a plait or gather is secured to the bar or case provided with a ratchet, and the case is moved on a guiding-ledge of the presser by a pawl worked by a bell-crank lever moved from the needle-bar. A dog in advance of the pawl holds the case and prevents it coming toward the presser with the cloth under the action of the coiled spring in the case until it is relieved by the pivoted bar, which is operated by the projection on the adjustable nut.

Claim.—1. Ratchet *i*, in combination with pawl *h* and dog *j*, adjustable arm *x*, and rocking axle E, each being constructed in the manner specified, for the double purpose of giving the outward movement to the bar or case C, and also increasing or decreasing the fullness of the plaits, in the manner described.

2. Ratchet *i*, pivoted bar S, adjustable projection *p*, and stop F, for the purpose of reversing the motion of case C.

3. The spiral spring K, adjustable nut *l*, and projection *p*, for the purpose of increasing the pressure of the spring increasing or decreasing the width of the plaits.

139,090.—*Photographic Camera.*—EMILE P. SPAHN, Newark, N. J. Application filed March 31, 1873.

A sliding jointed frame attached to the top of the camera is arranged with curtains and elastic bands in such a manner that when drawn forward it entirely screens the object-glass, and when drawn backward uncovers the same and forms a dark chamber at the rear of the instrument for facilitating focusing on the ground glass.

Claim.—1. The arrangement of the sliding frame C, in combination with curtains D, substantially in the manner and for the purpose hereinbefore described.

2. The arrangement of the hinged bars L L on the end of the sliding frame C, in combination with suitable India-rubber bands or springs N N, and the curtains D, substantially as and for the purpose described.

3. The arrangement of the movable bar E, with rods F, and curtain G, in combination with the movable frame C, operating in the manner and for the purpose substantially as specified.

139,091.—*Machine for Forming the Lips of Augers.*—JAMES SWAN, Seymour, Conn. Application filed April 15, 1869.

The dies terminate in projecting horns, which, when placed together, are in form the counterpart of that which the inner surface of the lips is to have; and the former is a mandrel or section of shaft, having in its end a cylindrical hole with a flat bottom, but with the re-entering angle filled out so as to unite the wall and the bottom by a curved surface.

Claim.—The combination of the crimp-dies, having the projections E F, with the rotary former I, substantially as specified.

139,092.—*Shaft-Coupling for Earth-Augers.*—THOMAS UREE, Corning, Iowa. Application filed September 7, 1872.

The coupling-pin is of rhomboidal form, being square in section and tapering both ways. It fits into corresponding sockets in the shaft sections, and is retained in place by screws. By this means the shaft sections are all made alike at both ends, and when joined possess a smooth surface.

Claim.—The coupling-pin D and sections of the shaft C, combined and relatively constructed substantially as herein shown and described, and for the purposes set forth.

139,093.—*Washing-Machine.*—GEORGE W. WAGEONER, of Scotland county, Mo., assignor to ANDREW R. CUSHMAN, same place. Application filed February 19, 1873.

The machine is constructed with a box in ordinary form, with a bed of rolls attached by screws inside at one end, and the other connected with an upright frame extending outside the box, and connected by staples to the treadle, by which tension is given to the roller-bed. The upper roll resting upon the bed is corrugated and has crossed arms to give it motion. The springs are attached to the upper edge of the tub.

Claim.—The combination and arrangement of the several parts, as follows: Roller I, wash-board frame L L, rollers O O O, bevel boards P P, rollers O' O', sash-frame C C, D D, and E, treadle F, and springs *f f*, when constructed and operating substantially as and for the purpose set forth.

139,094.—*Case for Law-Blanks.*—CORNELIUS L. WALKER, Charleston, S. C. Application filed March 29, 1873.

The leaves have metallic corner-brackets, under which the blanks are held. The leaves are bound together by linen guards clamped upon them by thick wooden strips.

Claim.—1. The combination, with the leaves A, of the raised corner-pieces B, back strips C, and the covers, as shown and described, to form a case for holding law-blanks, &c.

2. The mode of binding together the leaves A by means of stripe D of cloth applied to the adjacent sides of two adjacent leaves, and the rigid guard-strips C placed over these and secured to the leaves, as shown and described.

139,095.—*Glass Coffin.*—JOHN N. WALLIS and THEODORE WALLIS, Fleming, N. Y. Application filed April 12, 1873.

The coffin, composed of glass, is made in sections, which are joined and held securely together by vertical flanges on one side, which slide into clamping-recesses upon the other. The parts can be readily separated for packing, and by means of cement adjusted together air-tight and held without the aid of screws or bolts.

Claim.—In a burial-casket, the sides A A, provided with the vertical flanges *d* and clasps *e*, respectively, interlocking, as shown and described.

139,096.—*Steam-Engine Governor-Valve.*—ELIJAH WARE, Norfolk, Mass. Application filed February 15, 1873.

The oscillating valve is provided with openings in the side for regulating the flow of steam, and small apertures in the top for balancing the valve, and is connected by an arm and suitable mechanism to the governor, which operates it and regulates the flow of steam.

Claim.—The oscillating valve B, having one or more apertures K in the top and openings C in the side, arranged in a shell, A, and constructed and operated by suitable connections from the governor, as and for the purpose described.

139,097.—*Brake for Coal-Cars.*—DAVID WETSEL, Morris, Pa. Application filed April 12, 1873.

That only one pair of wheels may be locked, one of the prongs on each side is made shorter than the other, so that by moving the heads J a certain distance apart only one prong will be applied, while if the heads J are forced up against the bar E both prongs will be made to take effect, as before.

Claim.—1. A pair of bolts, F F, rigidly attached to the head-piece J, to slide through a beam, E, one to pass between the spoke of a front and the other of a rear wheel, substantially in the manner and for the purpose described.

2. A lever, K, connected with two pairs of wheel-locks, F F J, by rods pivoted on different sides of its fulcrum, to lock all four of the wheels, in the manner and for the purpose set forth.

139,098.—*Mechanism for Operating Screw-Propellers.*—JAMES WILCOXEN, Russellville, Ill. Application filed January 25, 1873.

Stationary frames are attached to the vessel having propeller and rudder frames jointed or pivoted thereto, the vibrating frames also carrying gearing, whereby the propellers are operated in any desired position, so as to steer the same by the joint action of the propellers and rudders. These frames may be readily attached to any character of vessel already built.

Claim.—1. Twin propellers E, mounted on vibrating frames B, having attached thereto the rudders D, and geared with the crank-shaft by horizontal wheels pivoted in the axes of the frames, the said frames being connected together, and the propellers geared to revolve in opposite directions, combined and operating substantially as specified.

2. The combination, with the vessel, of the stationary frames A and vibrating frames B, arranged and adapted for the support and operation of the propellers, substantially as specified.

139,099.—*Road-Scraper.*—LEVI P. WRIGHT, Chicago, Ill. Application filed October 11, 1872.

The scraping-plates are guided and stayed by means of a perforated frame which is secured above them and is held in place by braces fastened to the under side of the scraper-frame. A foot-lever releases the pawl which retains the elevating drum, thereby allowing the scraper-frame to descend.

Claim.—1. The combination of the supporting-rods b with the braces c, secondary frame B, and cross-heads a, substantially as specified.

2. The combination of the foot-lever n with the shaft or rod m and projections o for disengaging the pawl A, substantially as specified.

139,100.—*Washing-Machine.*—WALTER S. YOUNG, Park's Corners, Ill. Application filed April 10, 1873.

A washing-machine, constructed with its tub or box in ordinary form, with a rubber pivoted at one end by an adjustable hinge or hinged belt. The rubber is constructed widest at its pivoted point or end to admit of lateral or side motion, and in form of an angle with its sides and end closed to retain the steam when in use.

Claim.—1. The washer, consisting of the bar *c*, walls *i*, and sections of slats or rollers, substantially as set forth.

2. The combination of the bolt *l*, bar *c*, thumb-screw *n*, walls *i*, and sections of rollers or slats, substantially as specified.

139,101.—*Bureau and Ironing-Table Combined.*—WILLIAM W. ADAMS, Rockford, Ill. Application filed April 7, 1873.

A bureau with a folding top; a space in the rear, over which is a detachable ironing-board that can be placed in a recess in the rear.

Claim.—A combined bureau and ironing-table, provided with a removable skirt-board, B, the hinged top and ironing-table C, the recesses or sockets *a*, and gains *b*, all arranged and operating substantially as described.

139,102.—*Steam-Condenser.*—JOHN L. ALBERGER, Buffalo, N. Y. Application filed April 2, 1873.

A condensing apparatus in which the water and air from the condenser intermittingly flows into an auxiliary vessel, from which it is expelled by the direct pressure of steam from the boiler, supplied thereto by an oscillating valve, over the auxiliary vessel, whereby the use of the air-pump is dispensed with.

Claim.—1. The combination, with a steam-condensing vessel and the auxiliary water and air expelling vessel, communicating therewith at the bottom, and provided with water inlet and outlet valves, of the valve-chamber H and steam-valve L, by which steam from the boiler is admitted to said auxiliary vessel for expelling the water and air therefrom, and thence exhausted into the condenser, substantially as hereinbefore set forth.

2. The combination, with the condenser and auxiliary water and air expelling vessel and foot-valve *d'*, of the air pipe or pipes *n*, arranged substantially as hereinbefore set forth.

139,103.—*Steam-Pump.*—WALES ALDRICH, Dayton, Ohio. Application filed March 22, 1873.

The main valve has combined with it an auxiliary valve having on its back a rack, into which a segment-pinion gears, held down by a balance-spring. The valve is operated by a tappet-arm on the piston-rod and tappets on the valve-stem. The spring forces the auxiliary valve with the rack and segment backward to its central position as the main valve moves forward.

Claim.—The combination, with the auxiliary valve G, main valve E, valve-rod, and stop-connections, of the rack *e*, pinion *v*, and balance-spring *z*, substantially as specified.

139,104.—*Paper-Bag Machine.*—HORATIO G. ARMSTRONG, Trenton, N. J. Application filed October 9, 1872.

Improvement on his patent 31,191 of October 2, 1860. The overlapping ends are folded into the bite of two rolls by a vibrating knife-edge box, from which the paste is fed by an intermittingly-revolved roller, and the operative parts of said folder and the striker are so geared together as to adjust their relative movements in accordance with the length of bag made.

Claim.—1. In a paper-bag machine, the combination of drawing-rolls with a device for pasting and folding the bottom of the bag, and a striker for severing the tubes, and the appliances described, or their equivalents, for changing the speed of said paster in respect to that at which the tube traverses, for the purpose specified.

2. The vertically-vibrating paste-reservoir Q, having near its lower end a roller, *i*, actuated by the mechanism described, or its equivalent, for inducing the paste to pass to the creaser at the lower end of the reservoir, as specified.

139,105.—*Grater for Cider-Mills.*—WATSON BARR, Ypsilanti, Mich. Application filed March 17, 1873.

Grater-drum with a series of longitudinal dovetail-grooves for the reception of wooden staves provided with projecting steel teeth, the said staves being secured in place by a wedge driven in the groove under each one.

Claim.—The staves C, provided with grating-teeth and the wedges D, in combination with the dovetail-grooves *a* in the drum A, as and for the purpose set forth.

139,106.—*Packing-Box.*—DAVID L. BARTLETT, Ogdensburg, N. Y. Application filed March 17, 1873.

The box is constructed with ends fitted within the rabbet or shoulder and held by bolts, which may be removed and the box packed into small space for reshipping.

Claim.—The combination of the end piece C, having cleats, as described, the bolts *b*, and the sides, top, and bottom of the box, the parts being detachable from each other, as and for the purpose described.

139,107.—*Washing-Machine.*—LEVI BEAULIEN, Woonsocket, R. I. Application filed April 29, 1873.

The washing-machine is constructed in half-circular form, with three rubbers to correspond with the inner surface of it, which are pivoted at their centers to the tub, and having uprights, to which a pitman is attached, and connected to a crank-shaft supported by curved uprights at the end of the tub or box. The inner side of the tub and the rubbers have corrugated surfaces.

Claim.—The combination, with a tub having the inner arms C parallel with its side walls, of the independently-journaled washers H, levers *h*, pitman *k*, and crank-shaft *x*, having several cranks, *l*, one for each washer, arranged in an angular relation to each other, substantially as specified.

139,108.—*Centrifugal Machine.*—E. JOHN M. BECKER, New York, N. Y. Application filed March 15, 1873.

The cleansing-liquid is poured upon the articles or material in the basket, from whence by centrifugal action it is caused to pass through the material into the outer case, collects in a depression or well in the bottom thereof, is raised by an Archimedean screw into the perforated central cylinder, from whence it passes again and again through the material in the basket. The mantle is finally lowered to close the well, and the dirty liquid drawn off.

Claim.—1. The Archimedean screw D, arranged within the inner rotary chamber B of a double centrifugal machine, as set forth.

2. The well G, formed around the inner rotary chamber B of a double centrifugal machine, as specified.

3. The up-and-down-adjustable mantle F, arranged in connection with the two rotary chambers A and B in a centrifugal machine, as specified.

4. The stationary chamber, provided with a recess, H, in the bottom for the collection of the suds, in combination with the well G, for operation substantially as described.

139,109.—*Shoe-Fastening.*—MAXIMILIAN BOCH, New York, N. Y. Application filed April 5, 1873.

The folding-link is pivoted directly to the loop of the flap, without any intervening metallic plate, and prolonged beyond the point where it is pivoted to a bifurcated metallic plate attached to the other flap.

Claim.—The herein-described shoe-fastening, composed of the curved bifurcated piece C, having a cross-bar, *b*, for securing it to one flap of a shoe, and the curved link B, which has a similar cross-bar, *b*, for pivoting it to the other flap, and is prolongated beyond the point where it is hinged to the piece C, to form a lever-arm or handle, *c*, substantially as specified.

139,110.—*Machine for Pulverizing Clay.*—GEORGE C. BOVEY, Chillicothe, Ohio. Application filed January 9, 1873.

Clay is pulverized between the gravitating-rollers, loosely hung from the shaft of cylinder and the bars of the cylinder.

Claim.—In combination with a clay-pulverizer, constructed substantially as herein described, one or more gravitating-rollers, O O', journaled to slotted arms P P', and working within the screening-cylinder, as explained.

139,111.—*Chimney and Fire-Place.*—JOHNSON BRIGGS, Toronto, Canada. Application filed October 7, 1872.

A shaft extending below the fire-place from the chimney increases its ventilating action.

Claim.—The supplemental ventilating-shaft M, in combination with the chimney A, as and for the purposes set forth.

139,112.—*Rocking-Chair Fan.*—OTTO BRUECK, Union Hill, N. J. Application filed February 6, 1873.

Adds a rack and pinion or cord and pulleys to the weighted lever and frame of his previous patent, No. 132,345, instead of pivoting the fan-holder itself.

Claim.—The combination of a screw-clamp, B, arm C, pendulum D, and rotary arbor *f* carrying a fan, E, said pendulum being connected with the fan-arbor either by rack and pinion or by a cord and pulleys, substantially in the manner herein shown and described.

139,113.—*Machine for Re-Pressing Bricks.*—JOHN K. CALDWELL, Philadelphia, Pa. Application filed August 3, 1872.

Molds arranged on a wheel, to which motion is imparted by a cam on a horizontal driving-shaft, the crude bricks being pressed at each revolution of the shaft between the platen and follower of the mold; brushes arranged between molds to clean platen.

Claim.—1. The combination, with the horizontal mold-wheel, of the cross-bar and platen, the followers carried by said wheel, and the driving-shaft or equivalent mechanism, such shaft operating the disk, bar, and followers, all as set forth.

2. The combination, with the horizontal mold-wheel, of the reciprocating cross-bar, secured to vertical arms F F', one of which extends through the center of the disk and forms the axis thereof, as described.

3. The combination, with the reciprocating platen, of stationary brushes *n* arranged upon the wheel so as to pass beneath and in contact with the platen as the wheel revolves.

4. The combination of the followers with molds, the sides of which are reduced in width, as described, so as to present openings when the followers are depressed.

139,114.—*Knitting-Machine.*—WILLIAM CAMPION, Nottingham, and WILLIAM CAMPION, Sneinton, England. Application filed August 23, 1872.

There are two sets of cams on a cam-shaft, one of which is in operation when ordinary knitting is being done, and the other when the narrowing apparatus, which is brought into operation by a Jacquard, is at work. The subject-matter of the first and second clauses of the claim is for operating the locker and lifting bars; that of the third, for supporting, operating, and adjusting the needle-bar so as to knit slack courses, when desired; that of the fifth, for reciprocating the thread-carrier and depressing it at the end of its traverse; and that of the sixth, for operating the narrowing mechanism.

Claim.—1. The combination of the locker-bar *m* in the rear end of lever *h*, the shaft *i*, lifting-arm h^1, and the cams h^2 and h^3 upon the main shaft, for ordinary and narrowing operations, respectively.

2. The arrangement, substantially as described, whereby the lifting-bar *l* is connected to the hook-bar *f'*, so as to lift the jacks *d* at the same time that the hooks *j* rise.

3. The needle-bar a^2, supported by rods b^1, which project upwardly from a shaft, *b*, provided with eccentrics b^2, said needle-bar a^2 being also fixed to arms a^3 fastened to a shaft, a^4, carried at the upper ends of levers a^5, substantially as and for the purpose described.

4. In combination with the needle-bar and the devices for supporting and operating it, the segment b^3, having teeth or notches b^4 b^5 on its periphery and side, respectively, which teeth b^4 receive a gravitating catch or stop-lever, b^6, and which teeth b^5 receive a spring-catch, b^8, in order to enable the stiffness of the work to be varied and the same restored after a slack course has been taken, as herein explained.

5. The combination of the elements for reciprocating the thread-carrier and those represented in Fig. 10, for giving the dip to the same, as described.

6. The automatic narrowing apparatus, consisting of the devices *t* to t^{13}, inclusive, *u* to u^3, inclusive, main shaft *c*, and Jacquard apparatus *v* to v^6, inclusive, substantially as set forth.

139,115.—*Fruit-Jar.*—THOMAS B. CARROLL, Indianapolis, Ind. Application filed April 26, 1873.

The lower end of an elliptical cap-neck is provided with beveled lips, which engage with wedges placed on the lower sides and the widest portions of a flange on the inside of the throat of a jar.

Claim.—The combination, with the elliptical throat-flange *a*, having the wedges *b* on the widest portions of its under side, of the cap C, having the flange *c*, rim *f*, neck *d*, and beveled lips *e*, extending outward from the opposite sides of the lower edge of said neck, substantially as specified.

139,116.—*Preserving and Packing Compound for Eggs, Wood, &c.*—JAMES CONNELL, Jr., Collingwood, Canada, assignor to himself and WILLIAM CONNELL, same place. Application filed April 26, 1873.

Ground alum, white sugar, salt, Glenfield starch, charcoal, carbonate of iron; add water.

Claim.—1. A preserving composition, termed "Carbureted Alumen," composed of ingredients and in proportions substantially as herein specified, for the purposes set forth.

2. An aqueous solution or mixture of said composition, as described.

3. Packing material impregnated with the composition, substantially in the manner specified.

4. A mixture of petroleum-tar for wood paving-blocks, as described.

139,117.—*Shaft for Vehicles.*—SAMUEL P. CONNOR, Conshohocken, and PHILIP D. PFISTERER, Philadelphia, Pa. Application filed March 15, 1873.

Within a duplex frame, which is rigidly secured to the axle, the shafts are so arranged that they may be turned either to the right or left.

Claim.—1. A vehicle having the shafts or tongue secured to the duplex frame by two detachable pins at the sides of the frame and in front of the wheels, and upon either of which the shafts may be turned, as set forth.

2. The duplex frame, consisting of the upper and lower series of bars, between which the shaft or pole frame may be turned to either side.

139,118.—*Lock for Sliding Doors.*—ALONZO W. CRAM, St. Louis, Mo. Application filed February 3, 1871.

The spring-catch and key-block turn on the same pivot, and are so arranged that the hasp, on being inserted, will raise the catch without moving the key-block, thus permitting it to be locked without adjusting the tumblers.

Claim.—1. The spring-catch *F f f''*, in combination with the key-block H A I *i* and pivot G, common to both, all substantially as described.

2. The tumblers *J j l* M, in combination with the key-plate I *i*, block H, and catch *F f f''*, substantially as described.

139,119.—*Pruning-Knife.*—JOSEPH S. CRUM, Palmyra, Ill. Application filed April 28, 1873.

Both the blade and the hook are pivoted by their shanks to an upright handle, and the cutting is effected by pulling downward upon this single handle. The circular blade is slotted, and moves upon a bolt attached to the hook.

Claim.—The hook B and slotted convex-edged blade C connected by sliding bolt, and having their respective shanks pivoted between the straps of handle, as and for the purpose described.

139,120.—*Milk-Safe.*—JOHN P. DALE, Battle Creek, assignor to himself and DELEVAN E. DOANE, Ann Arbor, Mich. Application filed March 8, 1873.

An upright frame with reticulated exterior; a shaft, pivoted centrally at top and bottom, having radial arms with transverse pieces near the outer extremities, forming crucial rests for the pans; near the top a series of circular shelves, narrowing successively as they ascend, the topmost having upward flanges to hold ice, and a flanged radial slot that it may be withdrawn at pleasure.

Claim.—1. The shaft D, having bars F and G, shelves H H and I, arranged as described, for the purpose set forth.

2. The combination of the revolving parts above claimed with the safe, as and for the purpose set forth.

139,121.—*Fastening Pocket-Openings.*—JACOB W. DAVIS, Reno, Nev., assignor to himself and LEVI STRAUSS & Co., San Francisco, Cal. Application filed August 9, 1872.

To prevent the pocket giving way at the corners.

Claim.—As a new article of manufacture, a pair of pantaloons having the pocket-openings secured at each edge by means of rivets, substantially in the manner described and shown, whereby the seams at the points named are prevented from ripping, as set forth.

139,122.—*Harvester.*—JOHN S. DAVIS, Toledo, Ohio. Application filed March 12, 1873.

The driver's seat is made adjustable, so that his weight is exerted upon a lever for the purpose of balancing the heel of the cutter-bar.

Claim.—1. The combination of the seat I, hinged seat-support P, levers W W', and drag-bar N, substantially in the manner and for the purposes herein set forth.

2. The adjustable fulcrum *y*, in combination with a hinged seat-support and lever, W W', for the purpose of regulating the pressure of the inner shoe upon the ground by the weight of the driver, substantially as herein set forth.

3. In combination with a driver's seat adjustably connected to the frame of the machine, the scale *a'* and adjustable pointer, so that the driver can readily adapt his weight to the proper balancing of the heel of the cutter-bar, substantially in the manner described.

4. The pivot clamp-washers *w w*, the hollow casting X, and the levers W W', constructed, arranged, and combined substantially in the manner and for the purposes herein set forth.

5. The handle *d'*, hook *b'*, and projection *c'*, in combination with the hinged seat-support P, arranged substantially in the manner and for the purposes herein set forth.

6. The adjustable foot-hangers V V, placed under the main frame, in combination with the adjustable seat I, for the purposes set forth.

7. The combination of the bar *L*, lever O, pipe M, hinged to the gear-frame, and ratchet-plate *s* cast thereon, substantially as and for the purposes herein set forth.

139,123.—*Center-Slide Drop-Light.*—CHARLES DRAVO, New York, N. Y., assignor to THE ARCHER AND PANCOAST MANUFACTURING COMPANY, same place. Application filed February 6, 1872.

The cords of the drop-light pass around spring drums or barrels placed within the upper canopy. The conducting-tube of the drop-light slides within the main supply-pipe, and through the gas-chamber, to which the side pipes are coupled.

Claim.—1. The combination in a gasalier of the inclosing-case J, the distributer E, the stationary branch-light ducts C, one or more, and the drop-light duct H, and the spring drums or pulleys G, and cords S, substantially as herein specified.

2. The relative arrangement of the inclosing-case J, spring drums or pulleys G, cords S, and center drop-light duct H, whereby the said cords S are substantially concealed within the case J when the drop-light is not drawn for use, substantially as herein specified.

3. In a drop-light gasalier, the combination of the spring drums or pulleys G, one or more, with the drop-light duct H, when the latter is arranged to slide within and not upon the main supply-stem A, substantially as herein specified.

4. The combination in a gasalier of the following elements or parts: A supply-stem, A, a distributer, B, branch arms C, (one or more,) for conveying gas to stationary branch-lights, sliding pipe H, for conveying gas to a center drop-light, spring drums or pulleys G, one or more, provided with cords S for regulating the relative position between the stationary light or lights and the drop-light, substantially as herein specified.

139,124.—*Saw-Setting Machine.*—WILLIAM H. DOBSON, Cincinnati, Ohio, assignor to J. A. FAY & Co., same place. Application filed March 21, 1873.

The setting device is a bifurcated lever, the dies being inserted in the extremities of its limbs, while the latter are placed between two screw-pins, which serve alternately as fulcrums to the lever, causing the dies to close upon a tooth and the tooth to be set at every vibration of the upper end of the lever; the saw, meanwhile, being fed along by a pawl connected to another lever, with which a stud in the setting-lever comes in contact at every vibration. The fulcrum-pins are tapered, in virtue of which their distance apart may be regulated to suit saws of different thicknesses.

Claim.—1. In combination with suitable supporting, feeding, and setting devices, the L-formed clamp or vise E E' *a a' a''*, occupying the tapering recess *f*, and having the described (or equivalent) adjusting screw or bolt G.

2. In combination with the subject-matter of the preceding claim, the collar *g* and rubber washer H.

3. In combination, substantially as set forth, with suitable supporting, feeding, and clamping devices, the provision of handle J, blade K L L' l' M m M' m', and adjustable conical studs N N' for setting the saw-teeth, in the manner explained.

139,125.—*Piano-Lid Prop-Stick.*—MICHAEL DOHERTY, Cambridgeport, assignor of one-half his right to CHARLES SKINNER, Boston, Mass. Application filed February 6, 1873.

The prop-stick is hinged to the lid. Upon raising the latter the foot of the stick runs along a horizontal groove in the end casing, and rests in a notch at its inner end. The said foot withdraws itself upon the lid being pushed back still further; and then, upon closing the lid, returns to its place.

Claim.—1. The prop-stick C, hung by pin *b* to top A, and connected through pin *c* to a slot or groove, *d*, of case B, having a downward-projecting notch, *g*, the whole substantially as described, for the purpose set forth.

2. In combination with the prop-stick C, the groove *d* provided with the upwardly-projecting notch *h*, substantially as and for the purpose described.

139,126.—*Ventilating Grain.*—BROOKS DUNWIDDIE, Monroe, Wis. Application filed February 11, 1873.

To the ends of two hollow tubes is fastened a coil of wire, which is covered with wire-gauze, cable-wires are also fastened to the tubes to prevent stretching. The tubes extend through the walls of the building, so as to permit the air to enter and be distributed through the perforated wire-gauze.

Claim.—The wire coil or reel, the extremities of which are provided with suitable tubes, in combination with the linked cables and wire-gauze cover, the whole being arranged to operate as set forth.

139,127.—*Composition for Pavements.*—GEORGE L. EAGAN, San Francisco, Cal. Application filed April 6, 1871.

Claim.—1. The process of preparing concrete by first boiling pretroleum and pitch together, and then adding cement, clay, and gravel, in the proportions described, as herein set forth.

2. The concrete produced by the process herein described.

139,128.—*Printing-Telegraph.*—THOMAS A. EDISON, Newark, N. J., assignor to THE GOLD AND STOCK TELEGRAPH COMPANY, New York, N. Y. Application filed February 18, 1873.

Escapement, printing, and locking electro-magnets in same circuit. Printing-lever drawn away from type-wheel by its magnet. Escapement-magnet smaller than other two, so that when once charged it will respond to quick making and breaking of the circuit; but the others remain active from residual magnetism until there is a prolonged break in the circuit, when the locking-armature releases printing-lever, and the spring *l* pulls it up against type-wheel. Feed regulated by end of rocking arm *s* taking against small-wheel on type-wheel shaft.

Claim.—1. Three magnets in the main-line circuit, operating as set forth, in combination with the type-wheel lever, printing-lever *k*, spring *l*, and latch *i'*, substantially as and for the purposes set forth.

2. The sliding pawl *s*, in combination with the snail-wheel upon the type-wheel shaft, and the printing-lever *k*, substantially as set forth, for feeding the paper.

3. A printing-lever and an electro-magnet arranged in connection with the type-wheel and its magnet, substantially as set forth, so that the printing-lever is drawn away from the type-wheel by the electro-magnet, and the printing is effected by breaking the circuit to the electro-magnet.

139,129.—*Printing-Telegraph.*—THOMAS A. EDISON, Newark, N. J., assignor to THE GOLD AND STOCK TELEGRAPH COMPANY, New York, N. Y. Application filed February 18, 1873.

Two relay-magnets in main-line circuit, one with spring of strong tension, so that it responds to all main-line pulsations, and closes circuit to escapement magnet; other, having weak spring, is held to its magnet by residual magnetism, keeping printing-circuit broken until a prolonged break occurs in main-line circuit.

Claim.—1. Two relay-magnets in the main circuit, with retractile springs to the armatures of different tensions, in combination with relay circuits to the type-wheel and printing electro-magnets, respectively, of a printing-telegraph instrument, substantially as and for the purposes set forth.

2. Two relay-magnets in the main circuit, with armatures adjusted differently, in combination with a local circuit, effecting distinct and different operations, according to the length of pause between pulsations in the main line, substantially as specified.

139,130.—*Doll-Joint.*—JOEL A. H. ELLIS, Springfield, Vermont, assignor to THE CO-OPERATIVE MANUFACTURING COMPANY, same place. Application filed February 21, 1873.

The tenon of the joint is divided centrally by a saw-cut; this divided tenon, being slightly compressed in fastening together the body and limbs, holds the members, by friction, in any position in which they may be placed.

Claim.—A doll-joint constructed and formed substantially as shown and described—that is, with the slot A and tenon B, the latter having the saw-kerf D, as set forth.

139,131.—*Gas Purifier and Regulator.*—JOHN A. ENOS, Peabody, Mass., assignor of three-fourths his right to GEORGE HOLMAN, GEORGE PLUMER, and JAMES O. WHITTEN, same place. Application filed April 30, 1873.

Perforated basket filled with finely chopped or divided sponge, and incased in a tubular casing, constructed of two cones, with their bases united and made separable.

Claim.—1. In a gas purifying and regulating apparatus, arranged for attachment to the gas-pipe between the meter and the burner, the cylindrical casing A, consisting of two cones with their bases united by flanges, nuts and screws, and packing-rings, in combination with the interior metallic basket B filled and closely packed with fine-cut sponge, substantially as and for the purpose specified.

2. In a gas purifier and regulator, the conical basket B, of sheet or cast metal, having perforated ends and holding flange, as described, and filled with finely-cut and closely-packed sponge, substantially as specified.

3. As a filling for a sheet or cast metal basket of a gas-purifying machine, the finely-cut sponge G, applied and packed as described.

139,132.—*Burnishing-Press for Photographs.*—WILLIAM G. ENTEKKIN and JAMES BRAMBLE, Jr., Philadelphia, Pa. Application filed April 19, 1873.

The cards are prevented from stopping while passing through the burnisher, and are afterward pressed.

Claim.—1. In a photograph-burnishing apparatus, the combination of a burnisher and roll with independent feed and pressure mechanism, substantially as described.

2. The plate F provided with a recess, in combination with the removable burnisher *f*, substantially as described.

3. The wedge-yoke G, in combination with the lugs H H, by which the burnishing-plate is adjusted to the roll E, substantially as described.

4. The combination of an adjustable burnisher and roll with independent feed or pressure mechanism, and a heating apparatus, substantially as described.

139,133.—*Machine for Blocking Hats.*—E. COPELAND FALES, Foxborough, Mass. Application filed January 22, 1873.

A sectional ring, adjustable by means of and encircling band placed around the side crown of a hat-body, is pressed downward till in contact with the brim. The sectional ring is provided with ductile uprights, to the upper ends of which a head is attached, and provided with a yielding tip-block swung from the under side upon pendent guide-rods.

Claim.—1. In a hat-blocking machine, a block, A, and a sectional ring, B, arranged as described, in combination with the tip-block K, the whole operating substantially as described.

2. The sectional ring B with its encircling band E, spring-bands G, and head I, all arranged together, substantially as described, in combination with a block A, as specified.

3. The tip-block K having yielding spring *n* and guide-stems *o o*, all carried by the head I, in combination with a sectional ring, B, of said head I, and a block, A, the whole substantially as described, for the combined purpose specified.

139,134.—*Car-Starter.*—GEORGE FETTER, Philadelphia, Pa. Application filed December 20, 1872.

The power which is exerted to stop the car is absorbed in a spring, and is brought into operation when required to start the car, a spring forcing outward a converging rack, which engages with a pinion secured to the axle.

Claim.—1. The converging racks *m m* forming a permanent part of the spring-bar D and supported by the axle, in combination with a pinion, B, on the said axle, the whole being applied to a street-car, substantially as and for the purpose herein set forth.

2. The bar D and the slide H connected to an operating-lever, G, by a link, *i*, and having an inclined slot, *x*, adapted to a plate, I, embracing the axle A.

139,135.—*Washing-Machine.*—ABRAHAM FILKINS, Ypsilanti, Mich. Application filed November 13, 1872.

A slatted cylinder revolves on the edges of box, bearing against two curved roller-frames. A floating rubber-board is under the cylinder, and is borne by the water up against.

Claim.—The arrangement of the box A, slatted drum B, curved roller-frames C C', floating rubbing-board D, and crank E, when the parts are arranged to operate substantially as and for the purposes set forth.

139,136.—*Condensing and Feed Apparatus for Steam-Boilers.*—FRIEDRICH AUGUST FISCHER, Harsburg, Germany. Application filed November 30, 1872.

A cylinder and condenser with pipes and valves is arranged so that the steam, after having performed its duty on a piston, after it has moved the piston to the end of its stroke, passes to a condenser with a pump, and not only causes the atmospheric pressure of the piston to be counterbalanced, but, by a vacuum produced by condensation, induces an upward flow of the water from a well or cistern.

Claim.—The combination of the water-cylinder and its piston E or E', set in motion either directly or indirectly by the pressure of steam from the boiler, as described, the elevated condenser F, the steam-pipes *d* and A, and valve or valves *g*, the water-pipes *c e* *f*, and valves *b f*, the whole being arranged for operation in relation with each other, substantially as and for the purposes herein set forth.

139,137.—*False Mantel.*—JOHN T. FLEHARTY, Baltimore, Md., assignor of one-half his right to CHARLES S. COLLINS, same place. Application filed January 23, 1873.

Between the fire-place or the fire-place stove, and the mantel is placed a false mantel, made hollow to contain water for the protection of the mantel proper, and for moistening the atmosphere of the apartment.

Claim.—The combined false mantel and water-evaporator A with the means of attachment to the stove, holes E, knobs D, and opening *a*, substantially as and for the purposes named.

139,138.—*Window-Screen.*—WILLIAM H. FLETCHER, Washington, D. C. Application filed April 30, 1873.

The screen slides within its own frame like a sash, so that it may remain permanently in the window, and be capable of being opened to close blinds, &c.

Claim.—A window-screen, constructed to slide within its own frame, and adapted for application in manner substantially as and for the purposes set forth.

139,139.—*Saw-Sharpening Machine.*—FREDERIC E. FREY, Bucyrus, Ohio. Application filed March 20, 1873.

The frame carrying the grinding-wheel is made flexible by ball-and-socket joints, and adjustable by means of a slotted U-shaped plate, through which the belt passes. The holding-clamp is made adjustable upon its supporting arm and upon a second center or pivot arranged at right angles thereto.

Claim.—1. The slotted open arc or U-shaped plate C, in combination with the flexible wheel-frame or frame-bars D D hinged thereto, substantially as described, whereby the usual central pivotal support for adjusting the angle of said frame is dispensed with, and all cramping of the driving-belt avoided.

2. The parallel links or bars D D of the flexible wheel-frame, united at their inner or heel ends to the adjustable arc or sector plate C by the ball-and-socket joints C', and at their outer swinging ends with the bar E, in the manner and for the purpose described.

3. The flexible wheel-frame, in combination with the overhanging stationary frame or arm G' and counterpoise for balancing the wheel-frame, arranged and operating substantially as described.

4. The holding clamp or vise S S', made adjustable upon or around its supporting arm or rod, and upon a second center or pivot arranged at right angles to said rod or arm for adjusting the position of the clamp or vise, as described.

139,140.—*Lamp-Heater.*—WILLIAM FRIEL, San Francisco, Cal. Application filed March 13, 1872.

The sides of the polygonal flame-dish are inclined slightly more than ninety degrees with the bottom plate. An auxiliary flame-dish is placed upon the burner beneath the principal one, and serves also as a drip-cup.

Claim.—The dish F, constructed as described, in combination with the dish *e* and generator D, arranged substantially as and for the purpose set forth.

139,141.—*Music-Leaf Turner.*—JAMES H. GERRY, Boston, Mass. Application filed March 15, 1873.

The carriers or shells are moved to the left by a torsion-spring. At the bottom of the shell the turning-arm is pivoted, and each has an eye running upon a diagonal guide-wire, which deflects the arm from a nearly upright down to a horizontal position.

Claim.—1. The folder C connected with the vibrating plate D and combined with the guide wire or track E, substantially as described.

2. The vibrating plate D of a music-leaf turner, when connected with the spring-pivot *b* of an independently-moving folder, C, and with the projecting arm *f*, as specified.

3. The adjustable slide F, carrying a lever, G, and the shoulder G, when applied to operate in combination with the folders of a music-leaf turner, as described.

139,142.—*Edging-Machine.*—OTTO H. GRONBERG, Ferrysburg, and WILLIAM M. FERRY, Grand Haven, Mich. Application filed April 8, 1873.

The saws are moved upon the arbor by the operator through the agency of a system of levers or lazy-tongs.

Claim.—1. In gang edging and ripping machines, the combination of lazy-tongs with the saw-collars for adjusting the saws on their mandrel, substantially as herein shown and set forth.

2. The combination of the movable saws F F, the lazy-tongs D D', the levers G G, and the quadrants H H, arranged as described, for the purpose set forth.

139,143.—*Seed-Dropper.*—EUGENE L. GROSS, Springfield, Ill., assignor to himself, JOHN M. FORDEN, JAMES K. WELTER, JOHN O. SLOAN, and JAMES RATBURN, same place. Application filed April 15, 1873.

A rotary dropper-disk receives motion from a reciprocating slide, the flexible cut-off rotating with the disk.

Claim.—The seed slide C provided with an annular perforated recess, in combination with the annular detachable disk D, with seed-cells *a b*, and the flexible rotating cut-off E, all constructed and operating substantially as and for the purposes herein set forth.

139,144.—*Wheel for Vehicles.*—JAMES HAGEMAN, Williamsburg, Ohio. Application filed February 25, 1873.

The felly is bound with a sheet-iron protector before the tire is put on to prevent the burning of the felly in setting the tire.

Claim.—In a vehicle-wheel, the combination of the felly *a*, binding *c*, and tire *b*, all constructed and arranged substantially as set forth.

139,145.—*Carpet-Beater.*—WILLIAM H HANKINSON, New York, N. Y. Application filed April 25, 1873.

Rigid metallic links are fastened to a horizontal shaft and have their beating-surfaces parallel, or nearly so, to the axis of said shaft. The links or beaters are U-shaped, and are attached to arms radiating from the shaft.

Claim.—1. A carpet-beating machine, made with rigid jointed beaters, whose striking-surfaces are nearly parallel to the axis of the shaft that carries them, as described.

2. The U-shaped beaters *g* jointed to the radial arms *f* of the rotary shaft C, substantially as specified.

139,146.—*Die for Paper-Collar Machinery.*—GEORGE HARRINGTON and GEORGE D. ROLLINS, Springfield, Mass. Application filed February 26, 1873.

To the under side of the button-hole die-head is attached a secondary head by means of a "dovetail way" carrying a triangular die, whose counter-die is formed in the bed, as is also that of the button-hole die, the former and its counter-die being adjustable to fixed positions to or from the latter.

Claim.—The combination of the fixed plunger C and base E, provided, respectively, with a button-hole die and counter-die, with the movable plunger D and base F, provided, respectively, with a die, *d*, and corresponding counter-die, substantially as described.

139,147.—*Bell-Ringing.*—JAMES HARRISON, East Hampton, Conn. Application filed December 4, 1872.

An annular guard is firmly fixed within the bell, and, as the bell is slowly rotated mechanically on its axis during its swing, the clapper is supported from it in whatever direction it may fall.

Claim.—The combination of an annular clapper-guard with a bell, substantially as and for the purpose described.

139,148.—*Machine for Bending Pipe Stems.*—JOSEPH HARVEY, Philadelphia, Pa., assignor to himself, MONTGOMERY FORD, same place, and WILLIAM HARVEY, New York, N. Y. Application filed February 8, 1873.

The article to be bent, previously prepared, is placed in the jaws, and then, by bringing levers into position, the pin is inserted to hold the levers together.

Claim.—A bending instrument in which a plate, A, provided with projections *b b'*, is combined a lever, B, provided with projections *d d'*, and having a shifting fulcrum upon the said plate, all substantially as specified.

139,149.—*Saw-Filing Machine.*—CHARLES F. HENIS, Baltimore, Md. Application filed October 21, 1872.

The file-holder, supporting-plate, frame, coil spring, and vise or clamp for holding the saw.

Claim.—1. The file-holder, consisting of the end pieces B B', sockets *a a*, rods *b b*, on which the end piece B' slides, and set-screws *c c c'*, all arranged, constructed, and operated as set forth.

2. The combination of the file-holder with the plate D and adjustable cam E, as described.

3. The combination of the frame H F, plate D, file-holder, and stop *k*, as set forth.

4. The combination of the frame H F, plate D, adjustable stop *g*, and spring *k'*, as explained.

5. The combination of the frame, file-holder, adjustable plate *l*, stop *k*, and swinging plate D, as specified.

6. The combination of the frame H F, pivoted arm H', nipping-plates *i j*, catch *i'*, and handles I I', as described.

7. The combination of the file-holder, plate D, frame H F, and clamping apparatus, as set forth.

139,150.—*Pipe-Coupling for Railroad-Cars.*—MARSHALL HERSHEY, Jr., Philadelphia, Pa. Application filed March 27, 1873.

The pipes, which project from the adjoining ends of two railroad-cars, are connected by means of a nut swiveled to one of the pipes and adapted to screw-threads on the other. One of the pipes is made with an enlargement, which serves as a receptacle for packing to a pipe which slides within and has a bearing at each end of said enlargement, to prevent lateral movement and compressing the packing.

Claim.—1. The within-described coupling, in which are combined two pipes, A and A', a nut, B, swiveled to one of the said pipes, and a mass of packing, *x*, contained within the nut, and surrounding one pipe, and arranged to be forced against the end of the other pipe, substantially as herein set forth.

2. The combination, with the pipe *a* and its enlargement *a'*, of the sliding pipe *b* having a bearing at each end of said enlargement, and surrounded by a packing, as set forth.

139,151.—*Chain-Machine.*—BENJAMIN HERSHEY, Erie, Pa. Application filed February 14, 1873.

The chain-link to be welded has its open ends scarfed, and, after being heated, is placed between the dies in this machine; the treadle is then depressed, which simultaneously raises a mandrel into the link, and draws the supporting-pin from under the plunger, carrying the upper die which falls upon the link, the blow being increased by a spring. The plunger is elevated and supported above the lower die automatically.

Claim.—1. The combination of the detachable curved dies *b d*, having their faces formed as shown, die block B, plunger C, collar D, and cam-wheel G, operating substantially as described.

2. The die B, having a detachable curved steel packing, B', when the latter is secured so as to operate in connection with the dies *b d*, substantially as described.

3. The combination of the hinged base-board H, having a torsion or other spring attached, and so relatively arranged as to act in connection with the upper section of the plunger, as stated, pivoted arm K having a series of openings, *k k*, crank-arm *l* having a like series of openings, *l' l'*, and axle L, the same operating substantially as described and for the purpose specified.

4. The combination of sliding bar P having a slot, *p*, and stop-pin P', arm K, base-board H, and plunger C, the same being so arranged that, as the plunger is elevated, the sliding bar shall be so moved as to arrest its motion at the proper time, substantially as described.

5. The combination of the sliding stop-bar P, arm K, base-

board H, axle L, crank-arms *l* M, and treadle-arm M', operating substantially as described.

6. The combination of the double treadle N N', the pivoted arm N², traveling bearing-tongue O, and hollow die-block B, operating substantially as described.

7. The combination of the double treadle N N', pivoted connecting arm N², tongue bearing-pin O, rod M', axle L, arm K, bed-piece H, and plunger C, operating substantially as described.

139,152.—*Cigar-Trimmer.*—ALBERT HETTINGER, Philadelphia, Pa., assignor to GEORGE W. EDWARDS and JOSEPH M. PATTERSON, same place. Application filed February 3, 1873.

The upright part of the frame carries a curved lever-knife, bent to fit closely to the counter shear-rib, which is shaped to hold the cigar. The steps which limit the throw of the knife are formed upon the knife-lever near the fulcrum.

Claim.—The within-described cigar-trimmer, consisting of the frame B, with a recess, *y*, edged with a rib, and the laterally-bent cutting-lever A, having shoulders *a a'* and a curved edge, of the character described, maintained in close contact with the said rib by the fulcrum-bolt *d*, all as set forth.

139,153.—*Automatic Time-Printing Machine.*—JOHN C. HINCHMAN, Brooklyn, N. Y. Application filed October 2, 1872.

A ratchet-wheel, continuously moved by the clock-shaft, releases a vibrating lever once a minute, which, through a ratchet, rotates the minute-wheel the proper distance to bring to the printing point its successive numbers. This wheel, at each revolution, moves the hour and meridian wheel forward one number. The month and day wheels are moved by hand-levers. Dies representing the exact time are thus brought into line each minute, and, being covered by an inked ribbon, imprint the time at each depression of the platen.

Claim.—1. In an automatic time-printing machine, having a clock-movement motor, the combination therewith of an intermediate device, G, having no fixed connection therewith, but transmitting an intermittent time movement of one to the other.

2. In an automatic time-printing machine having a clock-movement motor, combining, with said motor and its transmitting-lever device G, a revolving-toothed wheel, L, having minute or other divisions, and arranged to operate the communicating lever G, in accordance with such divisions.

3. The lever device G, arranged to operate as described, provided with an adjustable-point, *i*, at one end, and a pivoted-pawl, *j*, at the other, and combined with an adjusting-spring, or its equivalent, as and for the purpose set forth.

4. The forked lever H H', in combination with the minute, hour, and meridian wheels *c a b*, and arranged to operate the two latter, as described.

5. The arrangement of the hand-slides I, with their spring-pawls I', for operating and limiting the movement of the date and month printing-wheels *c d*, as described.

6. The automatic time-printing machine having all its parts constructed and arranged for joint operation, as described.

139,154.—*Automatic Time-Printing Machine.*—JOHN C. HINCHMAN, Brooklyn, N. Y. Application filed October 2, 1872.

The type-dials are concentrically arranged in a horizontal plane, and are operated by bevel-gears connected with the main shaft. Each revolution of the minute-dial moves the hour-dial one space, while one revolution of the latter moves the vertically-arranged meridian-wheel and the disk indicating the day of the month each one space, and the latter in turn moves the month-disk. When the platen is depressed to make an impression and the rotation of the shaft is suspended, the clock-movement winds up a spring within one of the cog-wheels connecting said shaft with that of the clock, which spring, as the shaft is released, communicates to it its lost motion.

Claim.—1. In a time-printing machine, the type-dials, arranged and operated within concentric circles, essentially as and for the purpose described.

2. The outer concentric dial E of the timing-machine, arranged within an annular opening, *e'*, in the top plate C, and supported thereon, so as to be adjusted to indicate the month with respect to a fixed point, essentially as described.

3. The date, hour, and minute dials, each having a separate and distinct controlling-axis, one within the other, and operated with respect to each other, as and for the purpose set forth.

4. The meridian-wheel J, arranged at right angles to the concentric dials, and operated as described.

5. The meridian-wheel J, having every alternate indicator arranged to indicate the meridian divisions of every twelve hours, as described.

6. In combination with a time-printing machine and a clock or watch movement, a device for receiving and restoring the lost motion of the type-dials when arrested by the pressure of the stamp.

7. The device for restoring the lost motion of the type-dials, consisting of a toothed wheel, N, having a winding and unwinding spring, Q, upon the driving-arbor O of the motor, independent of the motion of the latter, the reaction and restoring motion of the dials being effected by the spring, as described.

8. In combination with a timing-machine and a clock or watch movement, the driving connecting shaft or rod I of the former, united to the latter by means of a universal joint, S, to render the motion of the transmitting-shaft I steady, essentially as described.

9. The combination in a stamping-machine of the connected levers T T' and slide U with the presser-stamp and the endless inking-ribbon M, arranged to operate the latter by the spring-pawl *s*² and ratchet-connection V', substantially as described.

10. Finally, the timing-machine, with its connected clock or watch movement, having all its parts constructed and arranged, for joint operation essentially as described.

139,155.—*Inking Attachment for Chromatic Printing.*—EDWARD A. HEWITT, Whitewater, Wis. Application filed April 1, 1873.

A series of ink-distributing straps and fountains, so hung in a supporting-frame as to be detachable and adjustable to and from each other, which frame has a lateral reciprocating motion to change the distributing-surface.

Claim.—1. A chromatic inking device, consisting of a series of ink-distributing straps, fountains, and ink roller, so combined with a printing-press as to have a lateral reciprocating movement, as described.

2. In combination with the series of ink-distributing straps, the series of detachable ink-fountains, as described.

3. The ink-distributing straps and fountains, so constructed as to be independently adjustable, laterally, upon the frame, as described.

139,156.—*Printing-Press.*—GEORGE W. HUNT, Newburg, N. Y. Application filed May 31, 1872.

The platen, adjustable on its arm, is moved into position to receive impression through cam and vibrating segments, and remains stationary while the form, secured to pivoted arm, after having been inked by roller-frame guided by adjustable ways, is thrown forward to complete the impression by toggle-levers. The distributing-rollers receive their ink from a cylinder which is supplied by a roller, which in turn receives its supply from an intermediate drum supplied by a supplemental roller from the fountain duct.

Claim.—1. The platen D, moved directly toward the bed till nearly in contact therewith, where it remains stationary, in combination with the bed B, moved toward the platen to complete the impression, all substantially as specified.

2. In combination with the above, the vibrating mechanism for the platen, having the rods G, cranks H H', segment K, arm *k*, and cam *l*, arranged to give a lateral motion to the platen from the same shaft M which operates the bed, and to hold it with the crank on the center during the motion of the bed, as set forth.

3. A platen vibrating from a nearly horizontal to a nearly vertical position, and remaining stationary in each extreme position, when mounted on a fixed axis, *e*, arranged a little in front of the plane of face, as and for the purpose specified.

4. The fountain-roller Y, distribution-cylinder Z, and inking-rollers, in combination with the intermediate ink-cylinder W and traveling rollers 3ª and 3ᵇ, substantially as and for the purpose specified.

5. The bed and the distribution-cylinder Z, in combination with the form-rollers and the angular ways R, which are obliquely adjustable for the purpose of removing the form-rollers from both the form and the distribution-cylinder, substantially as specified.

6. The combination of beam U, arm T *t*, cam S, lever 9, pitman 10, crank 11, and rock-shaft 13 12, operating substantially as specified.

7. The impression-beam U, link V, and bed B, in combination with crank-shaft J, which passes through, and has its bearings in, said beam U, cranks H H' attached to the projecting ends of said shaft, connecting-rods G, and platen D, connected substantially as and for the purpose specified.

139,157.—*Jack-Screw and Clamp Combined.*—THOMAS R. JACKSON, ASBERRY C. JACKSON, and CLAUDIUS S. WATSON, Sabine Pass, Texas. Application filed January 13, 1873.

Claim.—1. The head and foot-pieces A A' and their jaws *a a*, formed on screw-sockets B B, which are applied on screws C C, in combination with a lever-handle and pawls, substantially as described.

2. The right-and-left pawl-plate F, ratchet-wheel E, spring S, and cam-levers G, combined and applied to the lever-handle of the implement, substantially as described.

139,158.—*Trunk.*—GEORGE B. JENKINSON, Newark, N. J. Application filed March 14, 1873.

The strips, being of heavy material, and placed upon the portions most subject to strain and wear, permit the use of lighter leather for the body of the trunk.

Claim.—The strips C and D of heavy leather riveted and barred around the valance and edges of leather trunks, as and for the purpose set forth.

139,159.—*Washing-Machine.*—AMOS W. JENNINGS, Ravenna, Ohio. Application filed April 19, 1873.

Claim.—1. In a washing-machine, the combination of the frame A, corrugated rollers A', B, C, and D, guide-hand H, and fastening-blocks *g* and *h*, arranged, with reference to each other, substantially as specified.

2. In a washing-machine, the spring Y, having hooked rod W, in combination with the stop-plate L, the roller A', and its journal, constructed as specified.

139,160.—*Safety-Stirrup.*—LEMUEL R. JONES, Carthage, Ind. Application filed April 17, 1873.

Claim.—1. A stirrup having an arm or loop extending across the front, to act as a lever for disengaging the hinged bottom, substantially as set forth.

2. The stirrup *a*, bottom *c*, catch *e*, and arm *i*, when the parts are combined to operate as specified.

139,161.—*Machine for Elevating Building Materials.*—JOHN KING, Quincy, Ill. Application filed April 11, 1873.

A horizontal base-beam having at one end an upright extending upward beyond the point to which the building material is to be elevated. A pulley-wheel is secured to the top of each upright, and on the inner sides of the uprights near the top are pins. Each upright is surrounded by a frame consisting of two beams at right angles with the uprights bolted together, and having two raised metal yokes, which, extending upward, support a pulley-wheel revolving between them. A rope fastened to the pin above described passes under the pulley-wheel; attached to the frame, and then over the pulley-wheel at the top of the upright, thence around the drum of a windlass secured to the base-beam between the two uprights; and thence to the opposite pin around corresponding pulley-wheels of the other upright, thus forming an endless belt, by which one frame is raised and the other lowered by turning the crank of the windlass. V-shaped notches to support beds are cut in the beams of the frames, from which also depend metallic supports having platforms secured thereto to convey lumber and other material.

Claim.—1. The frame D, consisting of the beams E, bolts F, strips K, pulley-wheel L, pendants H, platforms I, and beams X, substantially as shown and described, and for the purposes specified.

2. The frame D, consisting of the beams E, bolts F, strips K, pulley-wheel L, pendants H, platform I, and beams X, in combination with the rope N, windlass M, pulley-wheel *c*, upright C, and pin *d*, when arranged and operated substantially as shown and described.

3. The beams X, when arranged relatively, one to the other, substantially as shown and described.

4. The parallel inverted V-shaped strips K, for the uses and purposes shown and described.

5. The supports H, when constructed and attached substantially as shown and described.

139,162.—*Shingle-Machine.*—SAMUEL M. KING, Lancaster, Pa. Application filed December 19, 1872.

The reciprocating planing-knife passes over the shingle, which is held in place by a spring-catch.

Claim.—The combination, on a shingle-planer, of the rest K, having recess *k* thereunder, and the spring-support O, arranged with respect to each other, the table, and the knife, as and for the purpose set forth.

139,163.—*Automatic Regulating-Valve.*—GEORGE L. KITSON, Philadelphia, Pa., assignor to himself and GEORGE W. CAER, same place. Application filed January 29, 1873.

If a portion of the work which an engine is designed to perform be taken off a momentary pulsation occurs in the pipe leading to the engine, the pressure on the lower end of the weighted valve becomes less than the constant boiler pressure exerted upon its upper surface, thereby moving the said valve which contracts the steam passage in the chest constructed to receive it. If, on the other hand, the work to be performed is greater than that for which the engine is adjusted, there is a momentary recoil of steam in the pipe leading to the engine, creating a pressure beneath the valve greater than the constant boiler pressure exerted upon its upper end, which, moving said valve, opens the passage and admits the proper quantity of steam to the engine.

Claim.—The combination of a steam-pipe, a loaded valve, and a steam-chest adapted to the valve, substantially as described, so that one end of the said valve shall be exposed to the action of the steam from the boiler and only of the pipe, while the other end of the valve is exposed to the steam at both boiler and engine ends of the pipe, as set forth.

139,164.—*Running-Gear for Carriages.*—RUFUS KLINE and ROBERT M. JACK, Pottstown, Pa., assignors of one-third their right to FORTUNATO G. POMPEJI, same place. Application filed November 25, 1872.

The axle, reach, and bolster are made U-shaped in cross-section, and are strengthened by means of thin metallic strips fastened to their under sides.

Claim.—1. The combination, with a U-shaped metallic axle, of a subjacent strip, welded to the under side of each journal, as and for the purpose described.

2. The U-shaped thin metallic perch-plates J, filling-pieces K, and clips L, combined as and for the purpose set forth.

3. The U-shaped plate M and flat plate N, constructed and combined with clips, as and for the purpose specified.

139,165.—*Manufacture of Shafting.*—CHRISTIAN F. KOERSLEY and WILLIAM WENSTHOFF, Dayton, Ohio, assignors to FARMER'S FRIEND MANUFACTURING COMPANY, same place. Application filed April 12, 1873.

Claim.—Bars of iron for shafting having slots or grooves formed in them, or an elevated rib formed upon them, during the process of rolling, for the purpose of receiving pulleys or wheels thereon.

139,166.—*Striking-Work for Clocks.*—GIDEON H. LEEDS, West Chester, and CHARLES N. THORP, Philadelphia, Pa. Application filed February 5, 1873.

The tripping-lever, which is raised by the hour-wheel, is so formed and arranged with starting and stopping pins and a projection resting on the pattern-wheel as to serve also as the detent-lever, thus combining the lifting and the starting and stopping actions in a single arm.

Claim.—1. The lifting-lever T, consisting of a single bar carrying the pins *h h'*, and formed with the knife-edge *f* between the pivot and free end of the lever, and having said free end raised by the projection *d* on the hand-arbor U, when arranged with the dividing-wheel F and wheel M with its pin *i*, as herein set forth.

2. The combination of the dividing-wheel F with the great-wheel E by means of the screw X and slot *l*, as and for the purpose above set forth.

139,167.—*Artificial Stone.*—WILLIAM H. LEWIS, Philadelphia, Pa., assignor of part interest to H. E. THAYER, same place. Application filed March 28, 1873.

Sulphur, alum, Portland cement, and sand.

Claim.—The within-described process for making artificial stone of the ingredients mentioned.

139,168.—*Refrigerator.*—WILLIAM H. LEWIS, New York, N. Y., assignor to JOHN K. LEWIS, same place. Application filed April 28, 1873.

A frame containing wire-gauze forming a door for the refrigerator when ice is not required, and a closed door of the ordinary kind when the refrigerator contains ice, made so as to be easily exchanged.

Claim.—The frame *g* and gauze A, applied to and combined with a refrigerator and the ordinary door *f* thereof, substantially as and for the purposes set forth.

139,169.—*Post-Hole Digger.*—AARON E. LINDSLEY, Paw Paw, Mich. Application filed April 1, 1873.

The handle is made in halves, attached together like a pair of shears, so that the earth can be compressed between the blades by operating the levers. A guard, F, surrounds and protects the handle-levers from too great separation, and the ratchet-bar, operated by the rod *m*, serves to retain the blades in their hold upon the earth after compression, so that it can be withdrawn without difficulty.

Claim.—1. The combination of the blades A A, hinged base B B with shank *b b*, and handles C C', all constructed and arranged substantially as and for the purposes herein set forth.

2. The blades A A, base B B, shank *b b*, and handles C C', in combination with the guard *f*, ratchet A, and rod *m*, substantially as and for the purpose herein specified.

139,170.—*Sealing Fruit-Jar.*—ROBERT S. MANNING, Trenton, N. J. Application filed March 25, 1873.

A jar is provided with a water-tight cover and a rubber cap to exclude air.

Claim.—A self-sealing jar provided with a locked water-tight cover, B, and an external rubber cap, C, to exclude air, substantially as and for the purposes herein set forth.

139,171.—*Lithographic Press.*—CHARLES C. MAURICE, New York, N. Y. Application filed March 12, 1873.

A printing-cylinder composed of a series of segmental stones arranged on a cylinder, which has its bearings in oblong slots in the frame, is kept in contact with an impression-cylinder by weights or springs. Moistening and inking is accomplished by an apron, which transmits the liquid to a series of rollers.

Claim.—In combination with the printing-cylinder D, composed of a series of segmental stones arranged upon the cylinder C, having the bearing in oblong slots *a*, as described, the weighted lever H, impression-cylinder E, rollers P Q R, endless apron I, and the moistening and inking apparatus, substantially as described.

139,172.—*Combined Heating and Cooking Stove.*—BERNARD MCCONNELL, Philadelphia, Pa. Application filed February 11, 1873.

The hot-air chamber, suitably provided with inducts and educts, is placed at the sides and above the oven in the elevated chamber over the rear of the stove between the air-chamber and the outer casing, and between it and the oven the products of combustion can pass freely. The heated air from this chamber is taken to upper rooms.

Claim.—1. The combination of an oven or ovens, an outer casing, flues, or passages, through which the products of combustion can pass in direct contact with the oven and casing, and an intermediate air-flue, H, as set forth.

2. The combination, with the said flue H, of inlet and outlet passages, as described.

3. The combination, with the oven, outer casing, and flue H, of the passage E communicating with the fire-place A, as specified.

139,173.—*Vegetable-Grater.*—ANDREW S. MCNEIE and WILLIAM D. STOCKTON, Philadelphia, Pa. Application filed April 11, 1873.

The longitudinal box or frame is provided with grooves to receive the movable grater-plate, and also with grooves to receive the sliding box having open top and bottom, said sliding box being provided with a self-adjusting follower having a handle on its upper end and a grater-plate on its lower end, and pins on its sides to engage in slots on the inside of the sliding box. The main box has a cover to allow the withdrawal of the sliding box and removable grater.

Claim.—The combination of the box A, having grooved sides A' to receive the box D and grater C, and a hinged door, B, closing one end, as shown, with the reciprocating box D having open top and bottom, side flanges d^1, and slots d^2, the self-adjusting follower E having pins e^2 *d*, handle e^3, and grating-plate e^1, and the removable grater C placed within the grooves *a*, all constructed, arranged, and operating substantially as shown and specified.

139,174.—*Pipe-Tongs.*—FRANK H. MERRILL, San Francisco, Cal. Application filed March 19, 1873.

An adjustable serrated chisel is arranged in one of the jaws of the wrench to adapt the instrument to different-sized pipes. A detent-pawl retains the chisel in position, which is released when the jaws are opened.

Claim.—The jaw A, in combination with the jaw B, having the sliding chisel C, arranged to be released by the pawl *i* when

the jaws are opened, substantially as described, and for the purpose set forth.

139,175.—*Elevating Ladder.*—ALEXANDER MILLER, New York, N. Y., assignor to GRAFTON T. NUTTER, Jersey City, N. J. Application filed December 26, 1872.

Claim.—In combination with a sliding ladder or series of ladders, a piston fitted to slide in a tube or a series of tubes, and operated by hydraulic power, substantially as and for the purpose specified.

139,176.—*Rotary Paper-Cutter.*—HENRY S. MILLER, Philadelphia, Pa. Application filed January 28, 1873.

The blades are beveled on alternate opposite faces, and binding is, therefore, prevented.

Claim.—The rotary cutter, constructed with cutting-sections increasing in radius toward their heels, so as to produce a draw-cut, substantially as herein described.

139,177.—*Pipe-Wrench.*—GEORGE P. MOLONEY, Detroit, Mich. Application filed March 5, 1873.

The bolt is constructed with a rib on the under side of the head, which meshes into the notches on the adjustable jaw.

Claim.—The combination of the bolt B, having rib *e* and sleeve *d*, with the levers A A', constructed as described, for the purpose set forth.

139,178.—*Polishing Device.*—JOHN C. MORRISON, Chicago, Ill., assignor of one-half his right to NELSON C. GRIDLEY and FRANCIS F. WARNER, same place. Application filed December 30, 1873.

Claim.—1. A scouring-utensil provided with a scouring-surface consisting either wholly or in part of India rubber.

2. A scouring-utensil provided with a scouring-surface consisting partly of India rubber and partly of a soft fibrous material.

3. A scouring-utensil provided with a scouring-surface consisting of India rubber and a soft fibrous material arranged together in alternate layers, and so attached to the utensil that the edges of the layers will constitute the scouring-surface, substantially as specified.

139,179.—*Railway Axle-Box Cover.*—EDWARD MOYEL and JAMES HOWELL, Wyandotte, Kan. Application filed July 22, 1872.

The spring, by means of which the cover is held in place, is secured to the axle-box instead of the cover as ordinarily, so that broken covers may be easily replaced.

Claim.—The axle-box A having the open sockets, in combination with the cover B having the shaft *a* and flattened places *c c'* and spring C, the spring being removably attached to the axle-box, as described.

139,180.—*Angling-Fly.*—JOHN MULLALY, New York, N. Y. Application filed January 25, 1873.

The wings serve to keep the fly right side up, in still water at least, and the hook-point lies hidden between them.

Claim.—An artificial fishing-fly and an attached hook arranged with the bend a^2 outside of the body and between the wings, so as to be concealed by the same, substantially as shown and described.

139,181.—*Can.*—CHARLES A. MURDOCK, Milwaukee, Wis. Application filed February 10, 1873.

The can has a flat shoulder on the top of the vertical side. Within this is a raised portion, into which is hooked a bail that rests on and within the circumference of the sides of the can, so as to be out of the way in packing many together.

Claim.—The pail A, having the shoulder D formed around its top, and the raised portion D, and the bail C hooking into it, the shoulder and bail being so arranged in relation to each other that the bail will fall and rest within the circumference of the top of the pail, as shown and described.

139,182.—*Animal-Trap.*—GEORGE A. NORMAN, Baltimore, Md. Application filed February 15, 1873.

The catch-bar upon the hood operates within a shorter radius than the bulk of the hood, and therefore reaches the animal sooner. The bait-hook is also provided with a guard to prevent easy removal of the bait.

Claim.—1. The combination of the base B, fixed portion A, hinged hook D, and spring *d*, said parts being constructed and arranged to operate substantially as described.

2. In combination with the fixed portion of the cage A and the hinged hood D, the cross-bar E on the hood, said bar being arranged to strike the animal as the hood descends, substantially as set forth.

3. The combination, in an animal trap, of the latch-piece, the bait-hook, and the trigger-piece, arranged as described, to prevent the withdrawal of the bait, and also to operate upon the hook to aid in springing the trap, substantially as set forth.

139,183.—*Step-Ladder.*—JOSEPH S. OAKLEY and BENJAMIN M. POST, Passaic, N. J. Application filed April 3, 1873.

The stiles are placed diagonally for strength, and have metallic connecting-pieces, which sustain the steps. The ladder is connected to the top platform by means of the dovetailed pieces E. Claim 4 covers the peculiar construction of the hinge, and claim 5 the mode of connecting the stiles at foot.

Claim.—1. The stiles A A, when set diagonally or in diamond form and used in combination with the notched steps C C, substantially as and for the purposes herein set forth.

2. In a step-ladder, metallic brackets B B to support the ends of the steps and connect and brace the stiles, substantially as herein set forth.

3. The combination of the stiles A A, platform D, and cross-bars E E, said cross-bars being dovetailed into the platform, and the ends of the stiles inserted in the cross-bars, substantially as herein set forth.

4. The hinge formed of the strap *a* and screw-hook *b*, the strap being secured to the back leg G, and the screw-hook passed through the cross-bar E into the platform D, to secure the same together, substantially as herein set forth.

5. The combination of the stiles A A, double cap J, and rivet *x*, for the purposes herein set forth.

139,184.—*Speed-Gage.*—JOHN W. OSBORNE, Washington, D. C. Application filed September 3, 1872.

A vane made to revolve within a chamber transmits, by the motion given to the contained air or other fluid, a pressure upon a spring resisting vane, which indicates by a pointer on a dial the rate of speed of any driving mechanism with which it may be connected.

Claim.—The combination of a revolving mechanism for producing within a chamber a vortical motion in a fluid; a resisting vane or disk, actuated by the motion of said fluid; a spring or its equivalent, giving said vane its resisting power; and a pointer, or other moving device, by which the motion or position of said vane is indicated; the whole constituting a rate or speed gage, substantially as described.

139,185.—*Medical Compound or Bitters for Treating Chills and Fever.*—THOMAS B. OWENS, Gatesville, Tex. Application filed April 5, 1873.

Dogwood-bark, wild-cherry bark, cinnamon-bark, calumba-root, gentian-root, orange-peel, nutmegs, cloves, red saunders, alcohol, water.

Claim.—The bitters compounded of the ingredients in the proportions substantially as specified.

139,186.—*Combined Refrigerator and Sideboard.*—GRANVILLE L. PACKARD, Everett, Mass. Application filed February 26, 1873.

The ice-receptacle is placed in one side of the sideboard. A dry compartment is formed by a vertical partition in one side of the refrigerating-chamber. Drawers are placed above the drying and refrigerating chambers.

Claim.—The improved refrigerating-sideboard, as described, the same consisting of the case A, constructed internally so as to serve as a refrigerator, and provided with the dry-air chamber D and one or more drawers, I, the said case having a flat top and a back-piece, all as shown and described.

139,187.—*Cooking-Range.*—JOHN L. PFAU, Jr., Quincy, Ill. Application filed March 17, 1873.

The horizontal sections of the metallic fire-pot are so set one upon another by the rabbeted edges, protected by encircling flanges, that sufficient space is left at the joints to allow the sections to expand or contract without breaking.

Claim.—The sectional fire-pot C, each ring having an encircling flange, *c*, at the outer and a rabbet at the inner top edges, a space being formed between the flange and top, and a lip, *c'*, at the lower inner edge, as and for the purpose set forth.

139,188.—*Watering-Column for Railroad Water-Tanks.*—JOHN N. POAGE, Cincinnati, Ohio. Application filed February 10, 1873.

A double incline is formed upon opposite sides of an enlargement upon the discharge-pipes, so that when the discharge-pipe is turned in either direction until the inclines bear upon rollers arranged upon the top of the column the weight of the parts, pressing downward, will cause said pipes to revolve until they reach their normal position, and thus render it impracticable for the discharge-pipe to remain at an angle to the track, except when purposely placed in such position. A tube extending below the freezing-point surrounds the valve-rod, which is provided with a piston that opens or cuts off communication between the drain and discharge-pipes as the valve-rod is moved up or down.

Claim.—1. In combination with the casing A, and with the watering-column C and C', provided with the projecting shoulder *c*, the double inclines *c'* and journaled rollers E, substantially as and for the purpose shown.

2. In combination with the column C and valve-rod N, the pipe or tube O secured within the upper end of said column, and extending downward within the same to a point near the valve-box, substantially as and for the purpose shown.

3. In combination with the pipe O and column C, the waste-water pipe R, substantially as and for the purpose set forth.

4. In combination with the valve-rod N, tube O, and waste-water pipe R, the piston *n* secured upon and moving with said rod, substantially as and for the purpose shown and described.

5. In combination with the pivoted operating-lever P, the slotted weight S provided with the arms T pivoted to or upon the legs Q', inclosing said lug and lever, and caused to engage with the latter by means of the pin *t* passing through the ends of said arms, substantially as and for the purpose specified.

6. The hereinbefore-described device, as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose shown.

139,189.—*Wind-Wheel.*—ALBERT RAYMOND, Waupun, Wis. Application filed April 5, 1873.

A wind-wheel is so arranged on a pivoted frame, which is provided with a sail or blade and with a weighted arm, that, when the wind increases, it tips it over and backward by means of the sail or blade, and when the wind decreases the weight brings the wheel back again to its vertical position. There is also an arrangement of parts by which a uniform stroke is communicated to a pump-rod, notwithstanding the tipping motion of the wheel.

Claim.—1. In combination with the pivoted head-block or frame C, having the wind-wheel mounted thereon, the blade or sail J and the weight K, when arranged to operate as described.

2. In combination with the wheel, mounted on the pivoted head-block C, and arranged to tip or turn backward, as described, the standards T, jointed rod R, link *u*, and pitman P, arranged substantially as described.

3. In combination with the pivoted head-block C, having the wheel mounted thereon, the rock-shaft V, provided with the arms *i* and *j*, the rod *k*, and the link *l*, when arranged as described, for the purpose of tipping the head-block up.

139,190.—*Breech-Loading Fire-Arm.*—THOMAS RESTELL, Birmingham, England. Application filed September 30, 1871.

When the lever and plate are drawn back to open the breech for the insertion of the load or cartridge the hooked end of the trigger will enter the notch in the stem of the striker, and retain the same back until the trigger is pulled, which releases the striker, and a spring impels the same forward and explodes the cartridge.

Claim.—The lever *a* carrying the plate *b*, the notched stem *d* of the striker *e*, and the trigger *h*, with its hooked end *j*, combined as shown, and operating substantially as set forth.

139,191.—*Washing-Machine.*—JORDAN RIGGSBEE, Chapel Hill, N. C. Application filed March 22, 1873.

A washing-machine attached to a tub by a hinged cross-piece, with an opening in its center near its entire length, held by a bolt and nut. Through its center is fitted a hollow screw, and through the screw a spindle which is connected with the rubber, each having a lever or crank on its top to increase or diminish its tension upon the clothes being washed, and for operating it.

Claim.—1. The combination of a cross-piece, B, hollow screw D, and a shaft, J, inclosed within and suspended upon said screw, and bearing the rubber at its lower end, substantially as and for the purpose specified.

2. The combination of the cross-piece B, hollow screw D, rubber-shaft J, and levers D' E, substantially as and for the purpose specified.

3. The cross-piece B, having a fissure, K, extending lengthwise of the same past the tapped orifice through which the screw passes, in combination with the bolt G, hollow screw D, shaft J, rubber F, and nut H, substantially as and for the purpose specified.

139,192.—*Treating Explosive Compounds to Render them Safe for Blasting and other Purposes.*—EDWARD A. L. ROBERTS, Titusville, Pa. Application filed May 7, 1873.

That class of explosive compounds which detonate by sudden agitation, produced by another explosion going off near them, are prevented from exploding by friction or by a spark by mixing them with water so as to form a paste. The well-known white gunpowder is of this class; also the chlorate-of-potash powder, and many others usually considered dangerous.

Claim.—1. The process herein described for treating explosive compounds and composition, the same consisting in combining with them water or other liquid, or with a hygrometric salt, so as to form a paste, as and for the purpose specified.

2. The method described for exploding moist or wet compounds, such as described, by igniting near them or in contact a fulminating or detonating material, as described.

3. The combination, in the same charge, of moist or wet compounds, such as described, with dry powder, capable of being exploded by a spark or with a percussion-powder, as set forth.

4. The explosive compounds herein described, made by combining dry powders with water or other liquid, so as to render them safe in handling and in use, as described.

139,193.—*Cultivator.*—REUBEN RUST, Odessa, Del. Application filed September 28, 1872.

A central beam, prolonged into a handle, carries a solid triangular tooth which lies in nearly a horizontal plane, and is connected to the rear end of the beam by means of a cutting-shank or standard. This may be used alone, or two more like shares, attached to short diverging beams, may be attached to either side, forming a hand implement.

Claim.—The hand-cultivator described, having the central beam A, provided with the handle B and tooth D, removable side beams B', and solid triangular-pointed teeth D', having upright shanks E, together with the coupling-band C, substantially as specified.

139,194.—*Water-Regulator and Alarm for Boilers.*—ROBERT SAFLEY, Seneca Falls, N. Y. Application filed March 12, 1873.

A cylinder containing a float is connected with the water in the boiler. A piston-rod connects the float with a cross-head, which operates a series of catches that hold up weights. When the water falls the first weight is detached, and, by means of a cord and pulleys, opens the valve that starts the pump. If the water falls still more, a whistle is blown by a second weight falling, and when raised to the proper level a third weight is detached and by the same means stops the pump.

Claim.—1. The cylinder C having a float inclosed, which is connected by the rod *a* with the cross-head *b* moving on the guides *c c*, said cylinder being removed from and connected with the boiler by the pipes D E, substantially as and for the purposes herein set forth.

2. Cross-head *b* attached to the float-rod *a* and provided with the bar *d*, having adjustable pin *f*, in combination with the hook A, cam *i*, weight H, cord *m*, and lever J, for closing the stop-cock in the steam-pipe connected with the pump, substantially as herein set forth.

3. The cross-head *b* attached to the float-rod *a*, and provided with the bar *d* having pin *f'*, in combination with hook A^1, cam i^1, weight H^1, cord m^1, and lever J', for opening the stop-cock in the steam-pipe connected with the pump, substantially as herein set forth.

4. The cross-head *b* attached to the float-rod *a*, and provided with the bar *d* having pin *f'*, in combination with the hook A^2, cam i^2, weight H^2, cord m^2, and whistle-lever *p*, for sounding the alarm, substantially as herein set forth.

5. The combination of the valve-stem *s*, wheel *w*, with notches *y y*, levers J J', and weighted arms O O with projections *f f*, substantially as and for the purposes herein set forth.

139,195.—*Corn and Cotton Planter.*—JOHN W. SAVAGE and FRANCIS M. DOTY, Parmitchie, Miss. Application filed February 5, 1873.

The plates *a* and *b* in the bottom of the hopper are connected by parallel levers, by which the space between them may be enlarged or diminished to regulate the quantity of seed.

Claim.—The combination of the hopper D with stirrer *f i*, movable plate *b*, stationary plate *a*, guard *d*, and lever E, all constructed and operating substantially as set forth.

139,196.—*Last.*—ISAAC N. C. SAVILLE, Worcester, Mass. Application filed March 3, 1873.

A pin or plug of wood is inserted in the heel of the last, with its grain transversely of the grain of the wood composing the last. The hole for the jack-spindle extends into or through the plug.

Claim.—A wooden last, provided with a wooden piece or plug, C, inserted and secured in the heel, in the position described, with the spindle-hole D extending into or through it, substantially as and for the purposes set forth.

139,197.—*Refrigerator and Mode of Cooling.*—JACOB F. SCHNEIDER, Brooklyn, N. Y., assignor to himself and PHILIP LENNART, same place. Application filed May 5, 1873.

The sides of the refrigerator are formed of porous plates made of clay, sand, sawdust, charcoal, pulverized glass, and sulphur. The bases of the plates rest in metallic boxes containing water, and by capillary attraction and evaporation the air in the refrigerator is cooled.

Claim.—1. In refrigerators, the combination of the porous plates B with the boxes C, set into the sides of the frame A, for placing the evaporating liquid therein, substantially as described.

2. The composition described, for producing the porous plates B, substantially as and for the purpose described.

139,198.—*Guttering-Tongs.*—JOHN SCHWARTZ, Philadelphia, Pa., assignor to himself and HENRY SCHWARTZ, same place. Application filed October 26, 1872.

The pins are adjustable independently of each other, so that a bend may be made at an angle with the edge of the plate.

Claim.—1. The combination, with one blade of the tongs, of independently adjustable stop-pins *g*, extending to and through elongated slots in the opposite blade, as set forth.

2. The combination, with the blade and its elongated slots *f*, of pins *g*, having external thumb-nuts *j* and collars *k*, fitting recesses at the inner side of the blade.

139,199.—*Harvester.*—HARVEY J. SILVERNALE, Golden Lake, Wis. Application filed January 3, 1873.

The platform is provided with an endless apron which carries the cut grain to the elevator, by which it is carried up and delivered to the dropper, and when a sufficient quantity has accumulated therein the driver, by a foot-lever, rotates the dropper and delivers the gavel upon the ground.

Claim.—1. The combination of the hinged platform, endless apron thereon, and elevator with the universal jointed extension-shaft and spur-wheels *u u u*, for driving said platform and elevator, substantially as and for the purpose set forth.

2. The combination of the foot-lever A, provided with spring-pawl, shaft O, provided with ratchet N, beveled wheels R and S, and dropper-shaft T, for the purpose of rotating the dropper, substantially as set forth.

3. The combination of the foot-lever A, locking-bar D, provided with springs H and F, and notch E, with the locking-lever K, for the purpose of holding the dropper in position while the gavel is being gathered, substantially as set forth.

139,200.—*Clothes-Wringer.*—HAMILTON E. SMITH, Fitchburg, Mass. Application filed January 8, 1873.

A clothes-wringer constructed with a loose flexible India-rubber roller, and located in the frame between three metallic rolls to allow it free motion, and motion given them by connection with the pinion on an independent shaft connected with the crank, and the gears covered by a boxing attached to the side of the frame.

Claim.—1. In a wringer composed of a flexible roller, R, rigid rollers C C^1 C^2, and gear-wheels *c* c^1 c^2 *b*, the arrangement of a hand-crank, pulley, or other equivalent device on the axle of the intermediate gear-wheel *b*, substantially as and for the purpose set forth.

2. The cap F, in combination with the axle *d* of the intermediate gear-wheel *b*, and with the gear-wheels *c* c^1 c^2, rigid rollers C C^1 C^2, and flexible roller B, all constructed and operating substantially in the manner described.

139,201.—*Machine for Pressing Clothes.*—HAMILTON E. SMITH, Fitchburg, Mass. Application filed January 8, 1873.

Two sides or ends are constructed, resting upon feet, with arms projecting, in the ends of which are rolls with tension-screws. From the projecting arms, and in connection with the

sides, are rolls, extended in their diameter, to receive the cylinder; and on its outer edge projecting blocks are constructed to receive the journals of small rolls, which are located outside of it. An endless apron is passed over the center cylinder from the roll in the extended arms, and another passing over the smaller rolls, which holds the article to be operated upon in close connection with the cylinder, and in their revolution carries the articles to the table for further operation. Motion is given to the machine by gears and crank.

Claim.—1. The combination of a receiving and of a pressing apron, the former being stretched over a central roller and over a tension-roller, and the latter over a series of pressing-rollers, arranged around the central roller and geared together with the same, substantially in the manner and for the purpose herein shown and described.

2. The discharge-roller G, combined with the pressing-apron H, receiving-apron F, and table I, substantially in the manner and for the purpose set forth.

139,202.—*Mattress.*—HAMILTON E. SMITH, Fitchburg, Mass. Application filed January 8, 1873.

The mattress is composed of a number of separate envelopes filled with hair, in the form of columns, and the columns are all inclosed in a large envelope to keep them in proper position for a mattress.

Claim.—In combination with a mattress having a series of columns, *a a*, as set forth, the envelope B for covering and supporting said columns, substantially as herein described.

139,203.—*Union-Coupling.*—WILLIAM B. SNOW, Brooklyn, assignor to EATON & COLE, New York, N. Y. Application filed April 9, 1873.

The pipe extension-piece is provided with internal and external screw-threads, a screw socket or sleeve, and jam-nut, whereby both sections of pipe may be fitted with a limited length of screw-thread, and the same provision for coupling the two sections of pipe obtained.

Claim.—The independent pipe extension-piece B, having a female thread, *b*, and male thread *d*, as described, in combination with the coupling-screw socket or sleeve C and jam-nut D, for operation, in relation with the externally screw-threaded ends of the pipe sections or lengths A A', substantially as specified.

139,204.—*Ore-Feeder for Grinding and Crushing Mills.*—CHARLES P. STANFORD, San Francisco, Cal. Application filed November 4, 1872.

As the tappet falls it strikes the upper end of a rod connected to a hinged section of the bottom of a chute, and jars the chute, causing the ore to fall under the stamp. As the tappet is raised a spring retracts the rod and hinged section to their original position.

Claim.—The angular rod J, with its turn-buckle T and spring *k*, for the purpose of operating the ore-feeding device by the drop of the stamp, substantially as above described.

2. The angular rod J, with its turn-buckle T and spring *k*, in combination with the hinged section A of the bottom of the chute, substantially as and for the purpose above described.

The chute G, with its hinged bottom section A, substantially as and for the purpose above described.

139,205.—*Corn-Planter.*—ABRAHAM H. STARK, Nevada, Iowa. Application filed August 17, 1872.

The machine is supported upon two wheels. The axletree carries a cam, which gives motion to the seed-slide by means of a forked head hinged to the vibrating bar, so that when the head is thrown back the motion of the seed-slide is arrested.

Claim.—The combination and arrangement of the cam-wheel D, lever E having the forked-piece E' hinged thereto, and transverse slide F, operating substantially in the manner shown and described.

139,206.—*Door-Bell.*—ADDISON A. STUART, Cedar Rapids, Iowa. Application filed March 28, 1873.

Two small pendent bells are attached to springs, which are moved by the arms of a T-shaped lever pivoted near the middle of its upright portion, the foot of the said lever being tripped in either direction by a star-wheel secured to the spindle of the door-knob.

Claim.—The mechanical arrangement, composed of the bells G G, attached to the wire C, forming springs confined by the pins c^6 c^5 c^4 c^3, the lever A, with its associate parts, the spring B, the bells G G, and the star-cam attached to the knob-spindle, all arranged as described, for the purpose set forth.

139,207.—*Apparatus for Treating Horses.*—DENNIS SULLIVAN, Washington, D. C. Application filed November 4, 1872.

Steam, generated in a boiler that is mounted on the same platform as the closet or stall, is admitted through a pipe arranged to pass between the horse's legs. The stall is provided with a window for releasing or confining the horse's head, and with a thermometer and ventilator for maintaining the proper degree of heat.

Claim.—An apparatus for treating horses with pure or medicated steam, having a close box or stall, C, and constructed and operating substantially as herein set forth, for the purpose specified.

139,208.—*Churn-Motor.*—JEROME B. SWEETLAND, Pontiac, Mich. Application filed February 27, 1873.

A chain upon a rock-shaft, the rock-shaft connecting by a pitman and a crank to a train of gearing, which, in turn, by means of a fly-wheel, and pitman and crank, operates a lever, which reciprocates the dasher-rod vertically, the chair having a back, and a transverse bar in front, upon which the operator may throw his weight by alternations, a pivoted foot-bar being adjustably connected to the frame.

Claim.—The combination of the oscillating seat C, provided with the round or handle L and attached to the shaft B, the arm D, pitman E, crank *a*, and the gearing, as described, connecting with the lever K and the adjustable foot-rest M, substantially as and for the purposes herein set forth.

139,209.—*Safety-Valve.*—GUSTAF SWENSON, Hackensack, N. J. Application filed January 30, 1873.

Used on water-backs of ranges. Constructed so that valve-spring and stem can be readily removed for repairs, &c.

Claim.—The semi-spherical valve *c*, arranged upon the extreme lower end of the valve-stem *f*, the upper end of which projects through the stuffing-box, in combination with each other, and with the spring *h*, shell A, and seat *d*, all constructed and arranged as herein shown and described, for the purpose specified.

139,210.—*Stove-Pipe Thimble.*—FREDERICK TARRANT, Saratoga Springs, N. Y. Application filed March 22, 1873.

The two sections of the thimble are held together by the spiral bead on the one interlocking in the spiral depression on the other.

Claim.—A telescopic stove-pipe thimble, the tubes A and B of which are provided at their outer ends with flanges A' and B', and have interlocking spiral beads *a* and *b*, substantially as and for the purpose specified.

139,211.—*Feather-Renovator.*—SOLOMON G. THANHAUSER, Baltimore, Md. Application filed February 21, 1873.

The steam-chamber entirely surrounds the interior chamber except at L. By means of the valves *a* and *a'* steam may be admitted to the renovating-chamber.

Claim.—1. In combination with the hollow cylinder A, the shell extending around its entire surface, the revolving shaft K, with wings L L, and valves *a* and *a'*, substantially as and for the purpose specified.

2. The hollow double-shell cylinder A, provided with doors B M, valves *a* G, and thermometer H, substantially as and for the purposes herein set forth.

3. The hollow cylinder A, with the shell extending around its entire surface, the valves *a a'*, pipes C and *b*, and the perforated bottom J, the several parts being constructed and arranged as and for the purpose specified.

139,212.—*Caster.*—JOHN TOLER, Newark, N. J. Application filed April 17, 1873.

The wire or rod spindle of a furniture-caster has a groove cut entirely around it, near its lower end, and the flange, of malleable iron, has a projecting sleeve formed on it; which sleeve or thimble tapers toward its end, and is pressed or crowded into the groove around the spindle; and the lower end of the spindle-rod is struck up or riveted in the usual manner. This construction of the caster, joining it very firmly, making its two parts relatively one, and preventing longitudinal displacement or the turning of the flange on the spindle.

Claim.—The grooved spindle A, combined with the flange B of malleable metal, which has a projecting sleeve, *b*, forced to partly enter said groove to retain the thimble, substantially as and for the purpose described.

139,213.—*Spittoon.*—HENRY TONGUE, Chicago, Ill. Application filed February 18, 1873.

The spittoon is in ordinary form, with open top, with angular bars crossing it, and so arranged that the smaller or intermediate bars or strips shall conceal the interstices between the larger, having the passages sufficiently open for the free passage of saliva, &c. On one side of it is attached a hollow handle with cover, through which its contents may be discharged.

Claim.—A spittoon, G, provided with the strips J and I L and hollow handle C, for concealing and emptying the contents, as set forth.

139,214.—*Box or Can for Paints, &c.*—HIRAM TUCKER, Newton, Mass. Application filed March 28, 1873.

A wooden box has its inner surface coated with glue, and also has paper glued to the inside of the ends and the whole of the outer surface. The paper on the inside of the box is covered with a coating of glue.

Claim.—1. A box for putting up paints and other like materials, made of wood and lined with glue or other material not soluble by the paint, and closed with a cover of wood, united thereto, substantially as described, so that it may be readily severed or removed from the box, as set forth.

2. A wooden can, formed as described, and having, between each or either end piece *e f* and the adjacent ends of the strips *a b c d*, interposed paper or paper-board, which is cemented to the end piece and to the strips *a b c d*, substantially as described.

139,215.—*Hedge-Hook.*—EDWARD S. TURNER, Palmyra, Mo. Application filed December 21, 1872.

Claim.—The hedge-hook herein described, provided with the fork E, as a new article of manufacture.

139,216.—*Railway-Scale Platform.*—CHARLES C. WARREN, Earl, Ill. Application filed November 23, 1872.

A dumping-platform is so arranged with a railroad-scale that grain may be transferred from a car upon the dumping-platform to another car standing on a lower and parallel track.

Claim.—An elevated railroad dumping scale-platform, provided with the rocker-beam B and stay-lock *d*, in combination with the frame A, adapted to operate in conjunction with a lower and parallel track, substantially as and for the purpose specified.

139,217.—*Cake-Cutter.*—JEREMIAH WEBSTER, Charlestown, Mass. Application filed March 26, 1873.

A table constructed with its top fitted to the frame and within it, resting upon thumb-screws for its adjustment for the different thickness of cake, &c., with its cutting-plate and former.

Claim.—The combination, with the cutting-plate, of the table D, composed of a platen, E, arranged within a frame, to be adjusted substantially as described, for the purpose specified.

139,218.—*Thrashing-Machine.*—HARVEY WEHLER, Hampton, Pa. Application filed March 12, 1873.

The straw is picked up and passed over an endless-toothed carrier that is arranged above, and revolving in the same direction as the slotted carrier that takes the grain and straw from the thrashing-cylinder.

Claim.—1. The straw-carrier *g h*, constructed and operated substantially as described, in combination with the carrier *b d*, all substantially as set forth.

2. The combination of the two carriers *b d* and *g h*, constructed and operated as described, with the beater H, all as and for the purposes set forth.

3. In combination with the carriers and beater, constructed and operated as described, the shoe or separator, as and for the purposes set forth.

139,219.—*Farm-Gate.*—JOHN W. WESTBROOKS and ALVEUS J. CLEMMONS, Aberdeen, Miss. Application filed March 1, 1873.

A latch adapted to a gate, which, sliding open half way, moves a quarter turn into a side position, the rack in which the rails glide being hinged to the fixed post. One end of the latch is pivoted in this rack, and when the gate is closed the latch end falls into its detent at the center of the gate.

Claim.—The combination of the fixed post B, rack A hinged to the said post, bar H, pivoted within the said rack and extending between the uprights I of the gate, so as to furnish a support for the latter to slide on, and the sliding and oscillating gate, substantially as and for the purpose specified.

139,220.—*Railroad Switch.*—CHARLES H. WHITE, White Station, Mich. Application filed April 3, 1873.

The shifting portion of the switch is made in two parts connected in the middle by a ball-and-socket joint, and co-operates with the converging points of the frog in a manner dependent upon the extent of the throw. The movement takes place at the joint, and is effected by means of a shifting-bar and switch-lever. The shifting-bar makes connection with the joint through a spring-wedge and a rounded block which allows play. A wood bed is placed across the track under the whole switch.

Claim.—1. A railroad switch provided with guide or guard rails *g h* secured between the rails of the main track, and connected together by means of a ball-and-socket joint, as described.

2. The combination of the wood bed *d* extending across the track from rail to rail, with frogs A, ties *c*, and bar *e*, as herein shown and described.

3. The guide-rails secured at the joint to the moving bar, in combination with the block *m*, and a wedge, substantially in the manner and for the purposes set forth.

139,221.—*Car-Coupling.*—EUGENE WILEY, Philadelphia, Pa., assignor of two-thirds his right to C. D. ALEXANDER and E. R. WINSHIP, same place. Application filed January 24, 1873.

The hooks have elongated pivot-holes, that their front ends may bear upon the face of the draw-head when draft is applied.

Claim.—1. The hooked levers D D with elongated pivot-holes *x x*, and secured to the plate A by the pivots *a a*, so that their front ends *b b* will bear against the flange B to relieve the strain on the pivots, substantially as herein set forth.

2. The combination, with the bed-plate A, ears G G, flange B, and bumper C, of the laterally-operating hooked bars D D, pivoted as set-forth, with their front ends fitting snugly against the flange B, the block E, springs *d d*, and cam H, all constructed substantially as set forth.

139,222.—*Combination of Center and Bilge Keels for Vessels.*—SAMUEL P. WILLEBY, Philadelphia, Pa. Application filed July 31, 1872.

Claim.—In a vessel-hull, the combination of the rounded center-keel and curved concave supplementary keels, as set forth.

139,223.—*Hose-Coupling.*—THOMAS WILSON and LUCIUS B. KENDALL, Kalamazoo, Mich. Application filed April 2, 1873.

Each butt is provided with a valve so arranged that when coupled together the valves are opened, and when uncoupled will automatically close by the pressure of the fluid or air within the pipe. A rubber ring or gasket projects from the face of each section of coupling, and the couplings are brought together and locked by eccentric or cam levers upon each section of pipe.

Claim.—The described coupling, consisting essentially of the parts A, having recesses for the gasket D and united by links B, and eccentric lever C, in combination with the cylinder F, having the apertures *e*, as described, for the purpose set forth.

139,224.—*Variable Cut-Off for Steam-Engines.*—WILLIAM WRIGHT, New York, N. Y. Application filed January 4, 1873.

The rock-shaft is placed horizontally below the cylinder, and is made adjustable lengthwise. On said shafts are arranged toes with reversely-inclined faces, which operate the slide-valve on vertical stems by coming in contact with toe-pieces thereon.

Claim.—The lifters E E arranged on reverse sides of the longitudinally-adjustable rock-shaft D, and constructed with upper outer surfaces or edges *n*, which are oblique in direction of their length relatively to the axial line of the shaft, in combination with the toe-pieces *m m*, the toes F F, the valve-stems *l l*, and the valves B B, substantially as shown and described.

139,225.—*Carriage-Top.*—GEORGE H. YOUNG, New York, N. Y. Application filed November 16, 1872.

The front portions of the top and sides are detachably secured to the fixed portions of the top and body.

Claim.—A carriage having a permanent top with an open front, and a removable or detachable front top portion, the whole adapted to be used in the manner and for the purposes described.

REISSUE PATENTS.

5,412.—*Lamp.*—JOSHUA E. AMBROSE, Colorado Springs, Col. Ter., assignor, by mesne assignments, to SARAH T. AMBROSE, same place, and EDWARD MILLER, Meriden, Conn.—Patent No. 30,381, dated October 16, 1860. Application filed February 12, 1873.

In connection with the wick-tube, having wick-raising mechanism, there is an auxiliary tube or passage to conduct gas from the oil-chamber to the flame. In the top of the burner are two conical plates or heaters above the wick-tube, and having air-space between them. Each has a central-flame slot. At the top of the wick-tube is a collar with perforated wings. The usual air-distributing plate is below. The burner is used without a chimney.

Claim.—1. In combination with the wick-tube and a mechanism for adjusting the wick, an auxiliary tube or passage leading from the lamp upward to conduct the gas from within the lamp to the flame, substantially as set forth.

2. The arrangement of the heaters G H with a space between them communicating directly with the external air, in connection with the collar *p* and plates *q q* fitted on the top of the wick-tube E and the perforated cap C, substantially as and for the purpose set forth.

3. The shaft *s* provided with the rod *f* and spurs *g*, which are within the chamber *d* of the wick-tube, in connection with the plates *h j k* and spring *i* on the said shaft, all being arranged to operate as and for the purpose set forth.

5,413.—*Machinery for Attaching Heels to Boots and Shoes, and Polishing the same.*—GEORGE W. ELLIS and CHARLES W. GLIDDEN, Stoneham, Mass., assignors, by mesne assignments, to JAMES W. BROOKS, trustee.—Patent No. 36,607, dated October 7, 1862. Application filed April 25, 1873.

Nails are forced through the inner sole into the heel from within; also, from the outer or wearing surface down through the heel-lifts by means of rods arranged to pass through nail-plates. Trimming and burnishing devices, actuated by a lever, move around the surface of the heel guided by a plate of the form of the finished heel.

Claim.—1. The perforated plate T having a shank or neck, *v*, fitted to work up and down in the tube O, which terminates at its lower end in a plate, S, provided with rods *v*, the perforated plate being forced downward to hold the heel of the shoe or boot firmly upon its last by a helical spring within the tube, in combination with the last or bed I, sliding tube G, rods *k'*, and cam H, when arranged for joint operation in the manner and for the purpose described.

2. The slotted lever Q fitted upon the tube O, and having a hinged knife, R, attached to its outer end by a shank or neck, *s*, fitted to work in a curved slot, *q*, in the plate P, when the whole is combined and arranged to operate in the manner described.

3. In combination with a mechanism for holding a boot or shoe, a burnisher arranged to move around and be held against the curved surface of the heel-edge by means substantially as described.

4. The strap or guard I' attached to the last I at its back part when used in combination with the rods *k'*, for the purpose specified.

5. The clamp M attached to the slide L, in connection with the plate N or its equivalent, when arranged to operate in connection with the knife R, substantially as and for the purpose specified.

6. The cutter *d'* provided with a gage, *e'*, attached to the adjustable arm U, which is connected to the plate S, as and for the purpose herein set forth.

5,414.—*Hemmer for Sewing-Machines.*—EDWARD HOWELL, Ashtabula, Ohio.—Patent No. 96,809, dated November 16, 1869. Application filed June 3, 1870.

Claim.—1. The hemmer, composed of portions D B E, folded and twisted as shown, and operating as described, to determine the width of hem, to fold the material as it enters the hemmer, to turn it again on itself, and to prevent the edge of the first fold from being turned against or entangled with the next fold.

2. The combination, with the twisted and folded hemmer, hereinbefore described, of the arm G, to prevent the uppermost fold from rising.

3. The combination, with the folded and twisted hemmer, hereinbefore described, of the presser-foot H, arranged and operating as described.

5,415.—*Fluting-Machine.*—JAMES W. MADDEN and JOHN DODSWORTH, Buffalo, N. Y.; said DODSWORTH assignor, by mesne assignments, to JOHN HEWITT.—Patent No. 123,156, dated June 18, 1872; antedated June 8, 1872. Application filed March 17, 1873.

Claim.—1. A fluting-machine, consisting of the base-plate A

and counter-die B, said parts having varying flutes on their opposite faces, and being reversible for conjoint operation, substantially as described.

2. A fluting-machine, consisting of two separate parts or sections, A B, having corrugations on one or more of their faces in the same plane, constructed and arranged substantially as described, so that the material to be fluted when laid upon the part or base A, besides being fluted, is rubbed down and polished by a reciprocating action given to the part or die B, as described.

5,416.—*Bustle.*—HARRIET H. MAY, Birmingham, Conn.—Patent No. 128,412, dated June 25, 1872. Application filed April 21, 1873.

Provides an interior web resting closely against the back of the wearer below the waist-line, and furnishing a holding device and means of support for one or more radial springs connected at their outer ends with an exterior web, and which is kept pressed outward from the body by such springs.

Claim.—1. The under web B employed for the attachment of the springs D, and to retain them in proper position, as described and shown.

2. The springs D combined with the webs A and B, in manner substantially as and for the purpose set forth.

3. The convex outer web A, formed, as herein described, of sections cut with a gradual taper from the wide end to a point at or beyond the midlength, and from thence tapering more rapidly to the narrow end, for the object specified.

4. The vertical springs E applied within pockets in the web A, and receiving the outward pressure of the spring, substantially as set forth.

5. The combination of the inner web B, the convex outer web A, and the springs D, substantially as set forth.

5,417.—*Letter-Copying Press.*—GEORGE C. TAFT, Worcester, Mass.—Patent No. 28,020, dated April 24, 1860. Application filed April 9, 1873.

The platen and its threaded screw-socket are cast in one piece, and the frame is recessed to receive its end when raised.

Claim.—1. The copying-press platen D and socket E, cast in one piece, and in which the opening for the screw is cast, substantially as set forth.

2. The socket *b* in the arch cross-piece C, in combination with the screw-socket E and screw F, as and for the purposes set forth.

5,418.—*Coal-oil Stove.*—JAMES H. THORP, New York, N. Y.—Patent No. 129,436, dated July 16, 1872. Application filed April 3, 1873.

The water-wicks, constantly saturated, are in direct contact with the interior surface of the oil-wick tubes, and serve to prevent them from becoming highly heated.

Claim.—1. The tubes *f f f* so arranged that the water-wicks shall absorb the water only from the bottom of the water-reservoir, in combination with the toothed wheels *b b*, and having between them spaces to allow a free movement of said wheels, as and for the purpose set forth.

2. The auxiliary lamp I, with one of the sides of its oil-reservoir curved inward, provided with metallic hooks *k* to support it on the rim of the water-vessel of the stove, as and for the purpose set forth.

3. The mica side lights in the lamp-chimneys, with corresponding lights in the outer cylinder or jacket, as and for the purpose set forth.

5,419.—*Tilting Chair.*—MARTIN VAN BUREN HOWE, Gardner, Mass., assignor to HEYWOOD BROTHERS & CO., same place.—Patent No. 73,721, dated January 28, 1868. Application filed May 10, 1873.

The seat is connected to the rear posts of the chair, or their cross-bar, by torsional rod-springs, and a stop is affixed to the front round of the chair, and passes under the seat and receives the rear of the seat when tilted backward.

Claim.—1. A chair, constructed so that the seat thereof is connected to the rear posts of the same or their cross-bars by means of torsional rod-springs, substantially for the purpose set forth.

2. In combination with the above, the stop *c*.

3. A tilting chair, constructed with torsional rod-springs, whereby the tilting of the same is facilitated by the torsional elasticity of said springs.

5,420.—*Branding Apparatus.*—J. WESLEY DODGE, Malden, Mass. Patent No. 89,829, dated May 4, 1869. Application filed March 7, 1872.

The brand is upon one face of the heater-case, to which is rigidly fixed the arms of a bail. It is pressed against the barrel-head by a hook at the end of a handle entering an eye on one side of the case.

Claim.—1. The arrangement and combination of hooked handle, the eye, and the bail with a brander or branding-box, provided with branding devices, and made to receive a heater, as described.

2. A brand, having the box or case that receives the heater-iron rigidly attached, at its opposite sides, to the opposite arms of a bail, substantially as shown and described.

5,421.—*Plow.*—LEWIS GIBBS, Canton, Ohio, assignor to himself, JOHN R. BUCHER, and WILLIAM A. WIKIDAL.—Patent No. 130,292, dated August 6, 1872. Application filed March 15, 1873.

The standard of the plow has a seat for the nut of a diagonal bolt, the head of which presents an acute angle, thus grasping one side of the colter-arm, the opposite edge of the arm being embraced in an angular seat.

Claim.—1. A plow-standard having on its inner side the enlargement or projection K provided with an upward diagonal bolt-hole, its upper side forming a seat for the bolt-nut, substantially as specified.

2. The bolt I with the hook-shaped head *i* at its lower end, forming, with the lug B of the standard, a dovetailed depression for the reception of the colter-arm, substantially as shown and described.

3. The standard A, when constructed with the overhanging colter-lug B and inclined nut-seat K, substantially as and for the purpose specified.

5,422.—*Paper Washer.*—EDMUND S. HANNA, Pittsburg, Pa.—Patent No. 119,604, dated October 3, 1871. Application filed December 14, 1872.

Claim.—A washer made of paper which has been previously treated with the concentrated mother-water of the chloride of zinc, &c., substantially as hereinbefore described.

INDEX OF INVENTIONS PATENTED MAY 20, 1873.

[The numbers in parentheses denote the classification of patents.]

Angling fly, (143,) J. Mullaly	139,180
Auger handle, (29,) S. W. Hemenway	139,006
Augers, machine for forming the lips of, (29,) J. Swan	139,091
Augers, shaft coupling for earth, (51,) T. Urie	139,092
Axle box cover, (122,) Moyel and Howell	139,179
Basket form, (109,) A. F. Scow	139,025
Bell, door, (24,) A. A. Stuart	139,206
Bell ringing, (10,) J. Harrison	139,147
Blind slats, machine for entering, (30,) J. Church	139,043
Boiler alarm, milk, (88,) S. Mangold	139,072
Boiler condensing and feed apparatus, steam, (148,) F. A. Fischer	139,136
Boiler flues, thimble for protecting, (148,) J. C. Farmer	138,998
Boiler water regulator and alarm, (148,) R. Sadly	139,194
Boot and shoe soles and welts, edge plane for trimming, (16,) B. J. Tayman	139,034
Boot and shoe tip, detachable, (16,) M. R. Hanley	139,060
Boots, &c., sample holder for displaying, (16,) J. Closs	139,044
Boots and shoes and polishing the same, machinery for attaching heels to, (16,) Ellis and Glidden, (reissue)	5,413
Box lifter, (79,) B. H. Smith	139,029
Box or can for paints, &c., (107,) H. Tucker	139,214
Box, packing, (63,) D. L. Bartlett	139,106
Branding apparatus, (146,) J. W. Dodge, (reissue)	5,420
Bricks, machine for repressing, (30,) J. K. Caldwell	139,113
Building blocks, mold for forming, (29,) A. Derrom	139,050
Building materials, machine for elevating, (79,) J. King	139,161
Bureau and ironing table combined, (91,) W. W. Adams	139,101
Bustle, (80,) H. H. May, (reissue)	5,416
Cake cutter, (88,) J. Webster	139,217
Can (58,) C. A. Murdock	139,181
Can for oil, &c., metal, (107,) G. W. Banker	138,986
Cane, (165,) M. Osborn	139,020
Car coupling, (122,) B. D. Moody	139,016
Car coupling, (122,) E. Wiley	139,221
Car, reversible street, (123,) W. T. Jenks	139,063
Car starter, (122,) G. Fetter	139,134
Cars, brake for coal, (31,) D. Wetsel	139,097
Cars, pipe coupling for railroad, (122,) M. Hennsey, Jr	139,150
Carpet beater, (62,) W. H. Hankinson	139,145
Carriage top, (31,) G. H. Young	139,225
Carriages, running gear for, (31,) Kline and Jack	139,164
Caster, (24,) J. Toler	139,212
Casting ornaments for sword scabbards, (33,) V. Price	139,023
Centrifugal machine, (155,) E. J. M. Becker	139,108
Chain machine, (60,) B. Hershey	139,151
Chair fan, rocking, (165,) O. Brueck	139,112
Chair, tilting, (62,) M. V. B. Howe, (reissue)	5,419
Chandelier, (90,) J. Kintz	139,066
Chimney cowl, (166,) J. H. Richardson	139,080
Chimney and fire place, (154,) J. Briggs	139,111
Churn motor, (45,) J. B. Sweetland	139,208
Cigar trimmer, (160,) A. Hettinger	139,152
Clay, machine for pulverizing, (20,) G. C. Bovey	139,110
Clocks, striking works of, (36,) Leeds and Thorpe	139,166
Cloth, machine for stretching and drying, (37,) W. Bailey	139,038
Clothes line pulley, (91,) G. H. Ryer	139,024
Clothes pressing machine, (91,) H. E. Smith	139,201
Clothes wringer, (91,) H. E. Smith	139,200
Clutch, friction, (87,) E. Allen	138,980
Copying press, letter, (146,) G. C. Taft, (reissue)	5,417
Cornice, stucco, (4,) A. Derrom	139,049
Cotton worm destroyer, (43,) J. Helm	139,062
Coupling, union, (167,) W. B. Snow	139,203
Cultivator, (43,) E. M. Graham	139,001
Cultivator, (43,) R. Rust	139,193
Cultivator, rotary, (43,) R. McKinley	139,013
Darning machine, stocking, (89,) B. Arnold	138,981
Darning machine, stocking, (89,) B. Arnold	138,982
Dental drill, (46,) J. W. Baxter	139,039
Dental fillings, porcelain block for, (46,) C. H. Mack	139,012

Digger, post hole, (51,) A. E. Lindaley	139,169
Doll joint, (143,) J. A. H. Ellis	139,130
Door check, (24,) G. E. Rittenhouse	139,082
Drill, seed, (133,) E. G. Matthews	139,074
Drilling or tapping instruments, stock for, (100,) G. Bunch	139,042
Drop light, center slide, (64,) C. Deavs	139,123
Dyeing madder colors, (11,) F. A. Gatty	139,056
Edging machine, (29,) Gronberg and Ferry	139,142
Eggs, wood, &c., preserving and packing compound for, (58,) J. Connell, Jr	139,116
Elevator, (79,) J. S. Baldwin	138,985
Engine compound steam, (150,) C. E. Emery	139,052
Engine governor valve, steam, (69,) E. Ware	139,096
Engines, variable cut off for steam, (150,) W. Wright	139,224
Explosive compounds for safe blasting, &c., treating, (71,) E. A. L. Roberts	139,192
Eyeleting machine, (16,) A. Dawes	139,048
Feather renovator, (62,) S. G. Thanhauser	139,211
Filter for water coolers, (167,) C. Schneider	139,085
Fire arm, breech loading, (18,) T. Restell	139,190
Fluting machine, (38,) Madden and Dodsworth, (reissue)	5,415
Fruit jar, (58,) T. B. Carroll	139,115
Fruit jar, sealing, (58,) R. S. Manning	139,170
Fruit picker, (63,) H. Mewes	139,015
Furnaces, straw feeding attachment for, (148,) D. Morey	139,075
Gage, speed, (42,) J. W. Osborne	139,184
Gas, manufacture of, (66,) F. A. Sabbaton	139,083
Gas purifier and regulator, (66,) J. A. Enos	139,131
Gate, farm, (52,) Westbrooks and Clemmons	139,219
Glass coffin, (68,) J. N. and T. Wallis	139,095
Governor, (69,) R. W. Gardner	139,055
Grain binder, (74,) S. D. Locke	139,008
Grain, elevating, conveying, storing, and shipping, (79,) H. L., P. F., and E. D. Chase	138,994
Grain, ventilating, (166,) B. Dunwiddie	139,126
Grater, vegetable, (28,) McNeir and Stockton	139,173
Hair curling, (161,) E. F. Crain	138,995
Harrow, (73,) T. M. King	139,065
Harvester, (74,) J. S. Davis	139,122
Harvester, (74,) H. J. Silvernale	139,199
Hat blocking machine, (76,) E. C. Fales	139,133
Hatchway protector, elevator, (79,) J. W. Meaker	139,014
Hatchways, closing, (79,) J. S. Baldwin	138,984
Hedge hook, (63,) E. S. Turner	139,215
Heeling machine, (16,) Glidden and Fairfield	139,058
Horses, apparatus for detaching, (31,) H. Latshaw	139,068
Horses, apparatus for treating, (144,) D. Sullivan	139,207
Hose coupling, (167,) Wilson and Kendall	139,223
Jack, lifting, (79,) W. A. Brunker	139,041
Jelly glass, (68,) D. C. Ripley	139,081
Knife cleaner, (88,) T. and L. Gingras	139,057
Knitting machine, (89,) W. and W. Campion	139,114
Ladder, elevating, (79,) A. Miller	139,175
Ladder, step, (30,) Oakley and Post	139,183
Ladder, step, (30,) Hardenbrook and Belford	139,083
Lamp, (90,) J. E. Ambrose, (reissue)	5,412
Lamp heater, (65,) W. Friel	139,004
Lantern, (90,) T. Smith	139,140
Last, (16,) I. N. C. Saville	139,030
Lathe for turning wood, (175,) Smiley and Small	139,196
Lathe for wood, turning, (172,) A. R. Park	139,028
Law blanks, case for, (146,) C. I. Walker	139,076
Lithographic press, (54,) C. C. Maurice	139,094
Lock for sliding doors, (93,) A. W. Cram	139,171
Loom stop mechanism, (95,) C. E. Barnes	139,118
Mail bag, (162,) T. J. Hardaway	138,987
Mantel, false, (4,) J. T. Fleehearty	139,061
Mattress, wire, (62,) H. E. Smith	139,137
Mattress, (62,) E. Parker	139,202
Medical compound, (98,) J. Conzelman	139,077
Medical compound, (98,) T. B. Owens	139,045
Mills, grater for cider, (19,) W. Barr	139,185
Mills, ore feeder for grinding and crushing, (3,) C. P. Stanford	139,105
Music leaf turner, (102,) F. H. Gerry	139,204
Nut and coffee roaster, (154,) D. T. Gale	139,141
Oil tank, self-measuring, (58,) J. Schalk, Jr	139,054
Oil wells, cleaning, (124,) J. J. Looney	139,084
Pad, metallic sweat and collar, (72,) J. M. C. Bennett	139,010
Paper bag machine, (109,) H. G. Armstrong	138,990
Paper clip, (146,) T. Orton	139,104
Paper collar machinery, die for, (109,) Harrington and Rollins	139,019
Paper cutter, rotary, (108,) H. S. Miller	139,146
Paper feeding machine, (117,) J. T. Ashley	139,176
Paper washer, (108,) E. S. Hanna, (reissue)	138,983
Pavements, composition for, (110,) G. L. Egan,	5,422
Petroleum, treating heavy, (26,) J. J. Looney	139,127
Photographic camera, (111,) E. P. Spahn	139,009
Photographs, burnishing press for, (54,) Entrekin and Bramble	139,090
Piano lid prop stick, (112,) M. Doherty	139,132
Pipe stems, machine for bending, (176,) J. Harvey	139,125
Pipe tongs, (100,) F. H. Merrill	139,148
Planter, corn, (133,) A. H. Stark	139,174
Planter, corn and cotton, (133,) Savage and Doty	139,205
Plow, (114,) L. Gibbs, (reissue)	139,195
Plow, (114,) G. B. Vaughan	5,421
Plow, wheel, (114,) I. B., Green	139,036
Plow, wheel, (114,) C. B. Stevens	139,059
Pocket openings, fastening, (38,) J. W. Davis	139,032
Polishing device, (70,) J. C. Morrison	139,141
Printing, inking attachment for chromatic, (117,) E. A. Howitt	139,178
Printing press, (117,) G. A. Hunt	139,155
Propellers, mechanism for operating screw, (130,) J. Wilcoxen	139,098
Pruning knife, (63,) J. S. Crum	139,119
Pump, compound steam, (118,) A. J. L. Loretz	139,070
Pump, compound high and low pressure steam, (118,) A. J. L. Loretz	139,071
Pump, submerged force, (118,) A. T. Hafford	139,003
Pump, steam, (118,) W. Aldrich	139,163
Punch and cutting nippers, hand, (72,) J. O. Reilley	139,079
Railroad switch, (120,) C. H. White	139,220
Railroad switch signal, (120,) J. Cullen	139,146
Railroad tie, (120,) W. H. Sterling	139,031
Railroad water tanks, watering column for, (120,) J. N. Poage	139,188
Railway coupling links, machine for forming, (122,) P. H. Healey	139,005
Railway scale platform, (121,) C. C. Warren	139,218
Range, cooking, (154,) J. L. Pfau, Jr	139,187
Razor strop, (44,) J. B. Lucas	139,011
Reamer, adjustable, (100,) A. Shedlock	139,087
Refrigerator, (58,) W. H. Lewis	139,168
Refrigerator and sideboard, combined, (58,) G. L. Packard	139,186
Refrigerator and mode of cooling, (58,) J. F. Schneider	139,197
Rolling metal, machinery for, (125,) George and Durfee	139,000
Roofing slates, attaching, (126,) S. Farquhar	138,999
Safe, milk, (45,) J. P. Dale	139,120
Saw filing machine, (131,) C. F. Henis	139,149
Saw setting machine, (131,) W. H. Dobson	139,124
Saw sharpening machine, (131,) F. E. Frey	139,139
Scraper, road, (110,) L. P. Wright	139,099
Screw and clamp combined, jack, (79,) Jackson and Watson	139,157
Screw driver, (29,) C. Law	139,009
Seat, folding, (69,) W. W. Parker	139,021
Seed dropper, (133,) E. L. Gross	139,143
Sewing machine, (134,) E. W. Beebe	139,040
Sewing machine, (134,) J. A. Davis	138,996
Sewing machine, (134,) L. W. Lathrop	139,067
Sewing machine hemmer, (134,) E. Howell, (reissue)	5,414
Sewing machine ruffler and gatherer, (134,) A. Johnston	139,064
Sewing machine ruffler and gatherer, (134,) F. Sievers	139,089
Shaft, vehicle, (31,) Connor and Pfisterer	139,117
Shafting, manufacture of, (67,) Knelaly and Wensthoff	139,165
Shingle machine, (174,) S. M. King	139,162
Shoe fastening, (16,) M. Boch	139,109
Spark arrester, (94,) E. Fontaine	139,053
Spark arrester and extinguisher for locomotives, (94,) J. W. Gray	139,002
Spikes, machine for extracting, (29,) Barsalouse and Graham	138,988
Spinning machinery, electrical stop for, (142,) H. A. Chapin	138,993
Spinning mule, (142,) J. J. Dewey	139,051
Spittoon, (62,) H. Tongue	139,213
Spring, door, (24,) M. L. Webster	139,037
Station indicator, (121,) C. Barton	138,989
Steam condenser, (148,) J. L. Alberger	139,102
Stirrup, safety, (72,) L. R. Jones	139,160
Stone, artificial, (153,) W. H. Lewis	139,167
Stove, coal oil, (65,) J. H. Thorp, (reissue)	5,418
Stove, combined heating and cooking, (154,) R. McConnell	139,172
Stove, heating, (154,) C. G. Thompson	139,035
Stove pipe damper, (154,) J. Emmert	138,997
Stove pipe thimble, (154,) F. Tarrant	139,210
Stove polish, (70,) J. I. Danforth	139,047
Sugar, manufacture of, (155,) A. F. W. Partz	139,078
Telegraph, printing, (50,) T. A. Edison	139,128
Telegraph, printing, (50,) T. A. Edison	139,129
Thill coupling, (31,) J. H. Parkhurst	139,022
Thrashing machine, (159,) H. Wehler	139,218
Thrashing machines, sacking attachment for, (159,) W. Masterton	139,073
Time printing machine, automatic, (42,) J. C. Hinchman	139,153
Time printing machine, automatic, (42,) J. C. Hinchman	139,154
Tongs, guttering, (136,) J. Schwartz	139,196
Trap, animal, (143,) G. A. Norman	139,182
Trunk, (162,) G. B. Jenkinson	139,158
Umbrella stretchers, manufacture of, (165,) J. Shepard	139,088
Valve, automatic regulating, (152,) G. L. Kitson	139,163
Valve balanced, (152,) F. P. Cady	138,992
Valve and cut off, rotary, (150,) J. W. Strange	139,033
Valve, safety, (152,) G. Swenson	139,209
Vehicle wheel, (31,) J. Hageman	139,144
Vessels, combination of center and bilge keels for, (137,) S. P. Willeby	139,222
Wagon brake shoe, (31,) H. Seltz	139,086
Wagon seat, (31,) J. U. Shultz	139,027
Washing machine, (91,) L. Beaulieu	139,107
Washing machine, (91,) A. Filkins	139,135
Washing machine, (91,) A. W. Jennings	139,159
Washing machine, (91,) J. Riggsboe	139,191
Washing machine, (91,) G. W. Wagooner	139,093
Washing machine, (91,) W. S. Young	139,100
Water-proofing compound for canvas, &c., (35) P. H. Morgan	139,017
Water wheel, (168,) Abell and Cole	138,979
Water wheels, adjustable chute for turbine, (168,) J. Abell	138,978
Well, driven or bored, (51,) J. E. Morrison	139,016
Whip handle caps, manufacture of, (165,) G. A. Burr	138,991
Whip socket, (31,) A. Searles	139,026
Windmill, (118,) T. R. and A. C. Jackson	139,007
Wind wheel, (118,) A. Raymond	139,189
Window screen, (62,) W. H. Fletcher	139,138
Wrench, pipe, (136,) G. P. Moloney	139,177

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED MAY 20, 1873.

Abell, J., Adjustable chute for turbine water wheels 138,978
Abell, J., and A. D. Cole, Water wheel 138,979
Adams, W. W., Bureau and ironing table combined 139,101
Alberger, J. L., Steam condenser 139,102
Aldrich, W., Steam pump 139,103
Alexander, C. D., assignee 139,221
Allen, E., Friction clutch 138,980
Allen Manufacturing Company, assignee 138,980
Ambrose, J. E., Lamp, (reissue) 5,412
Archer and Pancoast Manufacturing Company, assignee 139,123
Armstrong, H. G., Paper bag machine 139,104
Arnold, B., Machine for darning stockings 138,981
Arnold, B., Machine for darning stockings 138,982
Ashley, J. T., Paper feeding machine 138,983
Bailey, W., Machine for stretching and drying cloth 139,038
Baldwin, J. S., Closing hatchways 138,984
Baldwin, J. S., Elevator 138,985
Banker, G. W., Metal can for oil, &c 138,986
Barnes, C. E., Loom stop mechanism 138,987
Barr, W., Grater for cider mills 139,105
Barsalouse, J., and R. Graham, Machine for extracting spikes 138,988
Bartlett, D. L., Packing box 139,106
Barton, C., Station indicator 138,989
Baxter, J. W., Dental drill 139,039
Beaulieu, L., Washing machine 139,107
Becker, E. J. M., Centrifugal machine 139,108
Beebe, E. W., Sewing machine 139,040
Belford and Hardenbrook 139,004
Bennett, J. M. C., Metallic sweat and collar pad 138,990
Boch, M., Shoe fastening 139,109
Bovey, G. C., Machine for pulverizing clay 139,110
Bramble and Entrekin 139,132
Briggs, J., Chimney and fire place 139,111
Brooks, J. W., trustee, assignee, (reissue) 5,413
Brooks, J. W., assignee 139,058
Brueck, O., Rocking chair fan 139,112
Brunker, W. A., Lifting jack 139,041
Bryant, W. H., assignee 139,005
Bucher, J. R., assignee, (reissue) 5,421
Bunch, G., Stock for drilling or tapping instruments 139,042
Burr, G. A., Manufacture of whip handle caps 138,991
Cady, F. P., Balanced valve 138,992
Caldwell, J. K., Machine for re-pressing bricks 138,113
Campion, W. and W., Knitting machine 139,114
Carr, G. W., assignee 139,163
Carroll, T. B., Fruit jar 139,115
Chapin, H. A., Electrical stop for spinning machinery 138,993
Chase, H. I., P. F., and E. D., Elevating, conveying, storing, and shipping grain 138,994
Church, J., Machine for entering blind slats 139,043
Clark, P. J., assignee 139,066
Clemmons and Westbrooks 139,219
Closs, J., Sample holder for displaying boots, &c 139,044
Cole and Abell 138,979
Collins, C. S., assignee 139,137
Connell, J., Jr., Preserving and packing compounds for eggs, wood, &c 139,116
Conzelman, J., Medical compound 139,045
Connor, S. P., and P. D. Pfisterer, Vehicle shaft 139,117
Co-operative Manufacturing Company, assignee 139,130
Crain, E. T., Hair curling 138,995
Cram, A. W., Lock for sliding doors 139,118
Crum, J. S., Pruning knife 139,119
Cullen, J., Railroad switch signal 139,046
Cushman, A. R., assignee 139,093
Dale, J. P., Milk safe 139,120
Danforth, J. I., Stove polish 139,047
Davis, J. A., Sewing machine 138,996
Davis, J. S., Harvester 139,122
Davis, J. W., Fastening pocket opening 139,121
Dawes, A., Eyeleting machine 139,048
Deavs, C., Center slide drop light 139,123
Derrom, A., Stucco cornice 139,049
Derrom, A., Mold for forming building blocks 139,050
Dewey, J. J., Spinning mule 139,051
Doane, D., assignee 139,120
Dobson, W. H., Saw setting machine 139,124
Dodge, J. W., Branding apparatus, (reissue) 5,420
Dodsworth and Madden, (reissue) 5,415
Doherty, M., Piano lid prop stick 139,125
Donovan, F. J., assignee 139,003
Doty and Savage 139,195
Dunwiddie, B., Ventilating grain 139,126
Durfee and George 139,000
Eagan, G. L., Composition for pavements 139,127
Eaton and Cole, assignees 139,203
Edison, T. A., Printing telegraph 139,128
Edison, T. A., Printing telegraph 139,129
Edwards, G. W., assignee 139,152
Ellis, G. W., and C. W. Glidden, Machinery for attaching heels to boots and shoes, and polishing the same, (reissue) 5,513
Ellis, J. A. H., Doll joint 139,130
Emery, C. E., Compound steam engine 139,052
Emmert, J., Stove pipe damper 138,997
Enos, J. A., Gas purifier and regulator 139,131
Entrekin, W. G., and J. Bramble, Burnishing press for photographs 139,132
Fairfield and Glidden 139,058
Fales, E. C., Machine for blocking hats 139,133
Farmer, J. C., Thimble for protecting boiler flues 138,998
Farmers' Friend Manufacturing Company, assignee 139,165
Farquhar, S., Attaching roofing slate 138,999
Fay, J. A., & Co., assignee 139,124
Fetter, G., Car starter 139,134
Ferry and Gronberg 139,142
Filkins, A., Washing machine 139,135
Fischer, F. A., Condensing and feed apparatus for steam boilers 139,136
Fleehearty, J. T., False mantel 139,137
Fletcher, W. H., Window screen 139,138
Fontaine, E., Spark arrester 139,053
Ford, M., assignee 139,148
Forden, J. M., assignee 139,143
Frey, F. E., Saw sharpening machine 139,139
Frey, Sheckler & Co., assignees 139,139
Friel, W., Lamp heater 139,140
Gale, D. T., Nut and coffee roaster 139,054
Gardner, R. W., Governor 139,055
Gatty, F. A., Dyeing madder colors 139,056
George, W., and W. F. Durfee, Machinery for rolling metal 139,000
Gerry, J. H., Music leaf turner 139,141
Gibbs, L., Plow, (reissue) 5,421
Gingrass, T. and L., Knife cleaner 139,057
Glidden and Ellis, (reissue) 5,413
Glidden, C. W., and H. P. Fairfield, Heeling machine 139,058
Gold and Stock Telegraph Company, of New York, N. Y., assignee 139,128, 139,129
Graham and Barsalouse 138,998
Graham, E. M., Cultivator 139,001
Granite Roofing Company, assignee 139,017
Gray, J. W., Locomotive spark arrester and extinguisher 139,002
Green, I. B., Wheel plow 139,059
Gridley, N. C., assignee 139,178
Gronberg, O. H., and W. M. Ferry, Edging machine 139,142
Gross, E. L., Seed dropper 139,143
Hafford, A. T., Submerged force pump 139,003
Hageman, J., Vehicle wheel 139,144
Hankinson, W. H., Carpet beater 139,145
Hanley, M. R., Detachable boot and shoe tip 139,060
Hanna, E. S., Paper washer, (reissue) 5,422
Hardaway, T. J., Mail bag 139,061
Hardenbrook, J. J., and S. Belford, adjustable step ladder 139,004
Hardie, D., assignee 139,060
Harrington, G., and G. D. Rollins, Die for paper collar machinery 139,146
Harrison, J., Bell ringing 139,147
Harvey, J., Machine for bending pipe stems 139,148
Healy, P. H., Machine for forming railway coupling links 139,005
Helm, J., Cotton worm destroyer 139,062
Hemenway, S. W., Auger handle 139,006
Henis, C. F., Saw filing machine 139,149
Henszey, M., Jr., Pipe coupling for railroad cars 139,150
Hershey, B., Chain machine 139,151
Hettinger, A., Cigar trimmer 139,152
Hewitt, J., assignee, (reissue) 5,415
Heywood, Brothers & Co., assignees, (reissue) 5,419
Hilderbrann, W. H., assignee 139,089
Hinchman, J. C., Automatic time printing machine 139,153
Hinchman, J. C., Automatic time printing machine 139,154
Holman, G., assignee 139,131
Howe, M. V. B., Tilting chair, (reissue) 5,419
Howell and Moyel 139,179
Howell, E., Sewing machine hemmer, (reissue) 5,414
Howitt, E. A., Inking attachment for chromatic printing 139,155
Hunt, G. A. Printing press 139,156
Jack and Kline 139,164
Jackson, T. R. and A. C., Windmill 139,007
Jackson, T. R. and A. C., and C. S. Watson, Jack screw and clamp combined 139,157
Jenkinson, G. B., Trunk 139,158
Jenks, W. T., Reversible street car 139,063
Jennings, A. W., Washing machine 139,159
Johnston, A., Sewing machine ruffler and gatherer 139,064
Jones, L. R., Safety stirrup 139,160
Kendall and Wilson 139,223
King, J., Machine for elevating building materials 139,161
King, S. M., Shingle machine 139,162
King, T. M., Harrow 139,065
Kintz, J., Chandelier 139,066
Kitson, G. L., Automatic regulating valve 139,163
Kline, R., and R. M. Jack, Running gear for carriages 139,164
Knetsly, C. F., and W. Wensthoff, Manufacture of shafting 139,165
Lathrop Combination Sewing Machine Company, assignee 139,067
Lathrop, L. W., Sewing machine 139,067
Latshaw, H., Apparatus for detaching horses 139,068
Law, C., Screw driver 139,069
Leeds, G. H., and C. N. Thorpe, Striking works for clocks 139,166
Lenhart, P., assignee 139,197
Lewis, W. H., Artificial stone 139,167
Lewis, W. H., Refrigerator 139,168
Lindsley, A. E., Post hole digger 139,169
Locke, S. D., Grain binder 139,008
Looney, J. J., Treating heavy petroleum 139,009

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorised by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

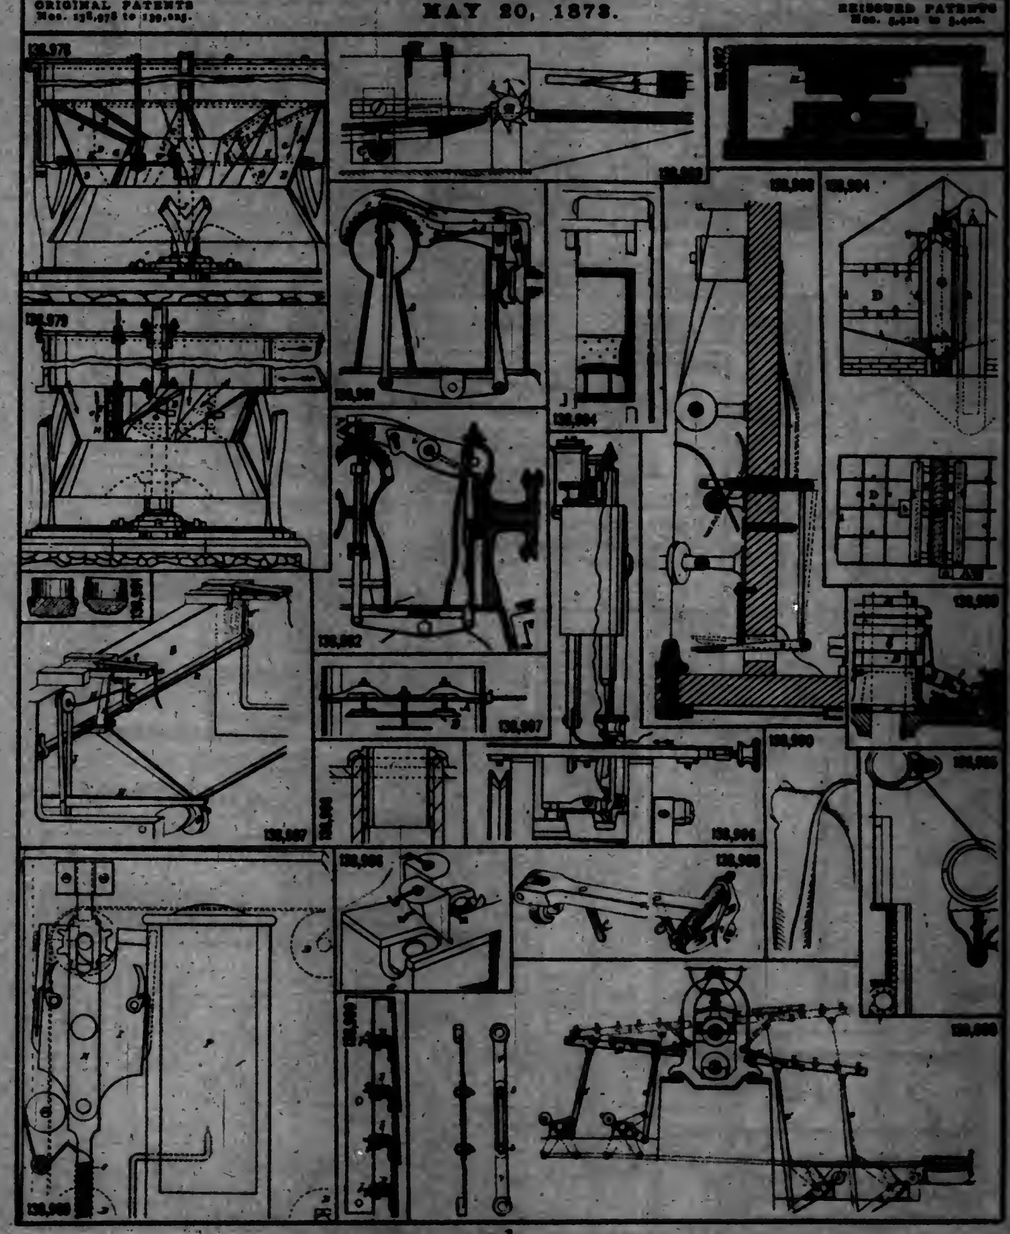
REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.



Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95

RULE IN EXTENSION.

On and after the first of July next, in all applications for extension the statement in writing, under oath, of the ascertained value of the invention, and of receipts and expenditures on account thereof, provided for in rule 72, must be filed with the petition.

COMMISSIONER'S DECISIONS.

R. J. HOLLINGSWORTH AND J. B. BURLEIGH, JR.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications of R. J. Hollingsworth and J. B. Burleigh, Jr., for patent for* IMPROVEMENT IN SOLDERING-IRONS.—*Decided May* 21, 1873.]

LEGGETT, *Commissioner:*

The device for which a patent is sought by the respective parties to this interference is a hollow soldering-block, provided with lateral openings for the escape of the steam or other vapors generated in soldering the covers upon cans.

Burleigh's application was filed December 29, 1871, and Hollingsworth's May 2, 1872. Hollingsworth, however, appeared in the Office as a joint applicant with one McMurray in an application, showing but not claiming this invention, July 25, 1871. McMurray also filed an application, showing but not claiming this invention, December 26, 1871. That application was placed in interference with Burleigh's February 14, 1872, while the joint application of McMurray and Hollingsworth was pending. There existed the same reason at that time, so far as appears from the record, for including the joint application in the interference as for placing the sole application in interference. Both showed the invention claimed by Burleigh, but it was claimed in neither. In both, however, it was included as an element in certain different combinations of parts constituting a soldering-tool, for which combinations claims were respectively presented.

On the 5th of April, 1872, McMurray and Hollingsworth presented an amendment embodying a claim for the lateral openings, but they withdrew it the next day, April 6. At the same time they entered a special joint disclaimer of this invention, and their joint patent was granted upon other subject-matter April 23, 1872.

After the decision of the interference in Burleigh's favor by the Examiner, McMurray filed a statement setting forth that he was informed Hollingsworth had an application pending for the invention in question, as claimed by Burleigh, and acknowledging him, (Hollingsworth,) "as disclosed in the testimony in the interference," to be the prior inventor; whereupon the interference between McMurray and Burleigh was dissolved and the present one declared.

Burleigh originally made no claim to the soldering-block with lateral openings. His specification did not even allude to the lateral openings, although they were shown in his drawing. His claim, now in interference, was induced by the following suggestion of the Examiner, in a letter of rejection of his claims dated January 16, 1872: "Applicant shows a lateral opening through the head of the tool, which allows the gases generated in the annular space to escape. This seems to be an improvement, and a claim made for it will be considered."

In response to this, Burleigh submitted an entirely new specification, with a claim embracing the lateral openings. This claim was not accompanied with a supplemental oath, as required by rule 11 of August 1, 1871, and such an oath was not appended until April 1, 1873. In view of the nature of this claim and the irregularity of its presentation, the Board made the very pertinent remark that they have "grave doubts whether Burleigh can take advantage" of his action

"to obtain and maintain the status now assumed by him on this case."

These facts of record have been used as a basis for argument, and are important in connection with the testimony and the respective theories of the case advanced by opposing counsel. It appears as a fact, although it is of no special advantage to him here, that Hollingsworth preceded Burleigh by more than five months in presenting an application for patent embodying the invention in dispute.

While Burleigh was first, as a matter of fact, to make definite claim to it, he was apparently wholly prompted to do so by the Examiner, and can only be considered as legally precedent to Hollingsworth upon the record by regarding his supplemental oath of April 1, 1873, as having been admitted *nunc pro tunc*. It appears, also, that the claim of Hollingsworth to the lateral openings as his invention, in his present application, is not inconsistent with his previous joint application with McMurray, for in that application it was only claimed, as would seem, inadvertently, for it was immediately disclaimed without having been considered by the Office. Furthermore, the disclaimer of McMurray—who is now a witness for Hollingsworth—in favor of Hollingsworth, argues no collusion with him, and is entirely consistent with his previous action. That McMurray is equally interested with Hollingsworth in this case, appears from the assignment to him of one-half interest in the invention. But that fact of itself, or in connection with the facts above referred to, is not necessarily any indication of collusion between these men. So far as appears from the foregoing, their testimony should be considered without prejudice on account of their connection, but with that caution with which the testimony of parties in interest must always be received and scrutinized.

Burleigh's preliminary statement dates his invention in the winter of 1870 and 1871, and alleges that he explained it to McMurray and Hollingsworth in April, 1871. Hollingsworth alleges in his preliminary statement that he conceived the invention several years ago, and explained it fully to several parties, Burleigh among the number, in the fall of 1870, and that the first pattern of the tool embodying the invention was made in November, 1870, by J. J. French.

Burleigh swears that he made the invention in December, 1870; that he then made a model and sketches; that he began making a soldering-iron in the shop of one Stewart in January following, and completed it soon after.

Stewart, however, does not corroborate Burleigh as to dates, and his testimony conflicts with that he previously gave in the interference with McMurray. Burleigh is also disputed by E. M. Lang, who, he says, did the turning of his block at Stewart's. He does not produce his alleged model and sketches of December, 1869, nor satisfactorily explain why he does not. He does not deny that he was, as Hollingsworth alleges, supplied by him (Hollingsworth) with the tools which he used and exhibited in the summer of 1871.

On the other hand, Hollingsworth's proof is not much more satisfactory to my mind. Leaving out of the account the testimony of his assignee, McMurray, which is so directly in conflict with his previous record testimony as to be wholly unworthy of belief, there are still abundant discrepancies. He relies upon French to show that a pattern and a tool were made in November or December, 1870. French swears in behalf of Hollingsworth that he thinks he made neither until May, 1871. One of French's employees, however, dates the making of the pattern the middle of March, 1871. But this only adds another discrepancy. French says that Burleigh was brought to him by Hollingsworth, and that previously Hollingsworth had ordered patterns for the tool. Burnett is the only witness who corroborates the statement of Hollingsworth that he embodied the invention in a model in November or December, 1869. He does not swear positively, and upon cross-examination the force of his "belief" in the matter is very much weakened.

A further discussion of the testimony will afford no additional light. As the Examiner remarked, the proof is very unsatisfactory. The imagination must be powerfully invoked in order to make a consistent explanation of the testimony on either side. But stripping off the mass of contradictions on both sides, I think there is left of proof, such as it is, more to support the belief that Hollingsworth is the prior inventor.

The decision of the Board of Examiners-in-Chief is therefore sustained.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,531.—*Gas-Retorts.*—Granted to WILLIAM BEAUMONT, June 28, 1859. Hearing June 11, 1873.

24,563.—*Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, June 28, 1859. Hearing June 11, 1873.

24,571.—*Machines for Finishing Hair-Brush Handles.*—Granted to THOMAS MITCHELL, June 28, 1859. Hearing June 11, 1873.

24,588.—*Machines for Making Hay.*—Granted to JOSHUA C. STODDARD, June 28, 1859; reissued June 1, 1869. Hearing June 11, 1873.

24,598.—*Harvesting-Machines.*—Granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870. Hearing June 11, 1873.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1859. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1859. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1859. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STEARNS, July 5, 1859. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1859. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Stiles.*—Granted to LEONARD WORCESTER, July 5, 1859. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. REMWICK, July 5, 1859. Hearing June 18, 1873.

24,700.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OLIN TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brakes.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JANKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,300.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,473.—*Scales*, granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars*, granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

26,415.—*Machines for Winding Thread on Spools.*—Granted to HEZEKIAH CONANT, December 13, 1859. Patented in England, June 22, 1859. Hearing June 4, 1873.

EXTENSIONS GRANTED.

24,199.—*Improvement in Gas-Regulators*, granted to E. HALL COVEL, May 31, 1859.

Claim.—1. The combining of the rotary pump or air forcer with the air-receiver and its fluid valve arrangements, in the manner herein set forth, whereby the one controls the action of the other, and through their joint action the charging apparatus is controlled, substantially as described.

2. Connecting the commingling-chamber of the charging apparatus with the air-receiver, for the purposes set forth.

24,200.—*Improvement in Hydrocarbon-Vapor Apparatus*, granted to E. HALL COVEL, May 31, 1859.

Claim.—1. Constructing the apparatus, for the purposes herein set forth, of detachable parts or chambers, substantially as described.

2. The arrangement of the feed pipes or tubes and outlet-pipes, whereby I am enabled to pass in the material to any one of the chambers, or to let out material and to examine the interior while the apparatus is in operation and the process of charging going on, as herein set forth.

24,227.—*Improvement in Cultivators*, granted to REUBEN M. MELTON, May 31, 1859; reissue No. 4,875, dated April 16, 1872.

Claim.—1. The adjustable links A and adjustable slides c, constructed substantially as described, and arranged to operate with and for the purpose of adjusting the distance between the plow-beams, as set forth.

2. The colter D, constructed substantially as described, with shovels or plows F, when both colter and shovels are independently and freely adjustable up or down the curved beams, so as to run deep or shallow, or at different depths, as set forth.

24,257.—*Improvement in Seats and Couches for Railroad Cars*, granted to THEODORE T. WOODRUFF, May 31, 1859.

Claim.—1. The combination and arrangement of the two frames with each other and with the supports therefor, connected with each compartment of a car, the said frames, when spread out, forming couches for two persons on the same level with the seats, and when transformed, one of the said frames forming seats, and the other the back for such seats, substantially as described.

2. Connecting the frame which forms the seats with the frame which forms the backs by means of links connected with one of the said frames by means of hinged joints, and with the other of the said frames by means of sliding hinged joints, substantially as and for the purpose specified.

3. In combination with the frame for the main seats, the auxiliary seats which slide under the frame for the main seats, substantially as and for the purpose described.

4. The frame for an elevated couch, when combined with the car, by means of sliding hinged joints, substantially as and for the purpose specified.

5. The combination with the elevated couch next to the side of the car or the equivalent therefor, the front elevated couch so connected with the car, substantially as described, as to admit of being let down to form part of a double couch, and thrown up toward the roof of the car when not wanted as a couch, as set forth.

DESIGNS PATENTED DURING THE WEEK.

(Omitted last week, bearing date May 20, 1873:)

6,663.—*Floor-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWD. C. SAMPSON, New York, N. Y. Application filed May 13, 1873.

6,664.—*Stocking-Fabric.*—JOHN W. PARKS, Philadelphia, Pa., assignor to THOMAS DOLAN & CO., same place. Application filed April 26, 1873.

[Designs bearing date May 27, 1873.]

6,665.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,666.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,667.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,668.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa Application filed May 13, 1873.

6,669.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,670.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,671.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,672.—*Stocking Fabric.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 14, 1873.

6,673.—*Scarf.*—CONYERS BUTTON, Philadelphia, Pa. Appplication filed May 13, 1873.

6,674.—*Scarf.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,675.—*Scarf.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,676.—*Scarf.*—CONYERS BUTTON, Philadelphia, Pa. Application filed May 13, 1873.

6,677.—*Organ-Case.*—LEVI K. FULLER, Brattleborough, Vt., assignor to J. ESTEY & CO., same place. Application filed February 19, 1873.

6,678.—*Ends of an Organ-Case.*—LEVI K. FULLER, Brattleborough, Vt., assignor to J. ESTEY & CO., same place. Application filed April 25, 1873.

6,679.—*Organ-Case.*—SAMUEL HAYWARD, Boston, Mass., assignor to J. ESTEY & CO., Brattleborough, Vt. Application filed April 25, 1873.

6,680.—*Ends of an Organ-Case.*—SAMUEL HAYWARD, Boston, Mass., assignor to J. ESTEY & CO., Brattleborough, Vt. Application filed April 25, 1873.

6,681.—*Cape.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed April 8, 1873.

6,682.—*Floor-Cloth.*—JOSEPH BARRETT, New York, assignor to D. POWERS & SONS, Lansingburg, N. Y. Application filed May 17, 1873.

6,683.—*Floor-Cloth.*—JOSEPH BARRETT, New York, assignor to D. POWERS & SONS, Lansingburg, N. Y. Application filed May 17, 1873.

6,684.—*Slate-Frame.*—JOHN M. COFFIN, Danielsville, Pa. Application filed April 22, 1873.

6,685.—*Cooking-Stove.*—REUBEN R. FINCH, Peekskill, N. Y., assignor to UNION STOVE WORKS, same place. Application filed May 5, 1873.

6,686.—*Bracket.*—ALBERT D. JUDD, New Haven, Conn. Application filed May 20, 1873.

6,687.—*Carpet.*—HUGH S. KERR, Philadelphia, Pa., assignor to LEEDOM, SHAW & STEWART, same place. Application filed May 5, 1873.

6,688.—*Carpet.*—HUGH S. KERR, Philadelphia, Pa., assignor to LEEDOM, SHAW & STEWART, same place. Application filed May 5, 1873.

6,689.—*Stocking Fabric.*—MARTIN LANDENBERGER, Jr., Philadelphia, Pa. Application filed May 6, 1873.

6,690.—*Casing for Soda-Water Apparatus.*—GEORGE F. MEACHAM, Newton, assignor to JAMES W. TUFTS, Medford, Mass. Application filed May 15, 1873.

6,691.—*Floor-Cloth.*—JEREMIAH MEIER, Lansingburg, N. Y., assignor to D. POWERS & SONS, same place. Application filed May 14, 1873.

6,692.—*Cooking-Stove.*—JOSEPH PECKOVER, CINCINNATI, Ohio. Application filed February 27, 1873.

6,693.—*Monument.*—JAMES SHARKEY, Brooklyn, N. Y. Application filed May 5, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

(Omitted last week, bearing date May 20, 1873:)

1,278.—*Cigars, Tobacco, and Snuff.*—BATCHELOR BROTHERS, Philadelphia, Pa. Application filed May 5, 1873.

1,279.—*Bourbon Whisky.*—HIRAM LIVINGSTON, Albany, N. Y. Application filed May 5, 1873.

1,280.—*Fish.*—THE AMERICAN SARDINE COMPANY, New York, N. Y. Application filed May 15, 1873.

[Trade-Marks bearing date May 27, 1873.]

1,281.—*Files and Rasps.*—G. & H. BARNETT, Philadelphia, Pa. Application filed April 28, 1873.

1,282.—*Medical Compound.*—EDWIN R. BURNHAM, Chicago, Ill. Application filed May 19, 1873.

1,283.—*Braids, Gimps, Fringes, Trimmings, &c.*—TOBIAS KOHN, Hartford, Conn. Application filed May 19, 1873.

1,284.—*Medicine.*—PACIFIC BALM COMPANY, New York, N. Y. Application filed May 17, 1873.

1,285.—*White Zinc-Paint.*—WADSWORTH BROTHERS & CO., New York, N. Y. Application filed May 17, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date May 27, 1873.]

ORIGINAL PATENTS.

139,226.—*Railway-Car Axle.*—RICHARD N. ALLEN, Pittsford, Vt. Application filed March 3, 1873.

Car-wheels are secured to the journals of independent sleeves, which revolve around a hollow axle, and are secured thereto by lock-nuts.

Claim.—The hollow shaft A, nuts B, sleeves C D, and collar E, all constructed and combined to operate in the manner as and for the purpose set forth.

139,227.—*Apparatus for Preventing Rapping Noise in Machinery.*—GUSTAVUS AMES, Rochester, N. Y. Application filed February 5, 1873.

Combined with the rotating cam or other device, the dropping of the rod of which or the cam-wheel causes the rapping noise to be obviated, is a surrounding case containing liquid tar, oil, or other suitable liquid, which, being interposed between the lower end of the rod and the cam-wheel, insures noiseless motion.

Claim.—The case for containing liquid tar or equivalent liquid, in combination with the vibrating frame and cam-wheel, substantially as and for the purpose specified.

139,228.—*Curtain-Cord Fastener.*—JOHN P. ARNOLD, Philadelphia, Pa. Application filed February 17, 1873.

The bracket has a longitudinal recess in its face and a nut near its lower end, through which passes the adjusting-screw having on its upper end a sliding piece carrying the cord-pulley.

Claim.—The combination, in a window-shade fixture, of a bracket, A, having a longitudinal recess, c^1, in its face, and a nut, A′, at or near its lower end, with the sliding bearing-piece B, and an adjusting-screw, C, to operate it, in the manner and for the purpose herein shown and described.

139,229.—*Stop-Cylinder Printing-Press.*—HENRY BARTH, Cincinnati, Ohio. Application filed October 16, 1872.

As the rack of the type-bed engages the cogs of the cylinder the feed-table is moved forward and the gripers seize the sheet. The type-bed and cylinder now move together to make the impression, until a half revolution of the latter causes its large tooth to engage the jaw of a lever and the cylinder to stop. The bed moves on to receive ink from the fountain-rolls and back in contact with the distributing-rollers, when the operation is repeated. As the paper is fed by the gripers the preceding sheet is released and fed out of the top of the machine by friction-belts.

Claim.—1. The hangers O, in combination with the connecting-rod N, having on its end the spring 107, and the double-armed lever L ending in the female stop-and-start tooth *f*, substantially as and for the purpose set forth.

2. The cam *u* on the cam-shaft *z*, in combination with the cam-rod *v*, the elbow-lever *s*, the rod *p*, arms *n* and A, and feed-board F, for the purpose set forth.

3. The shaft 14, in combination with the shaft 13, operating substantially as described, to cause the tips of the fingers 21 21 to follow the motion of the India-rubber band, in their descent.

4. The mode of vibrating rollers longitudinally, by laying them between two vibrating arms, the one at one side and the other at the other side of the press.

5. The adjustable bearings 56, in combination with the bearing-holders 57, the bars 61, and the set-screws 60, substantially as and for the purpose set forth.

6. The elastic bands or tapes 108 108, Fig. 4, under the cylinder, attached to the rods 103 and 109 for the purpose of holding the paper to the cylinder smooth and free from wrinkles.

7. The arrangement by which the blankets and the tympan-sheets are fastened to the cylinder, consisting in the clamping-bars 114 114, Fig. 4, and 115 115, and the blanket-winders 110 110, with the hooks 112 112, or similar devices, for holding regrets around which the blankets or tympans are laid.

8. The mechanism by which the ink-fountain roller 38 can be turned by hand, and by which the amount of turn of this roller may be regulated from the feeder's stand.

139,230.—*Thimble for Ships' Rigging.*—THOMAS G. BELL, Brooklyn, N. Y. Application filed March 18, 1873.

The thimble is prevented from turning or becoming loose.

Claim.—As a new article of manufacture, the solid or cast thimble described, provided with the oblong pin-hole B and the groove formed upon a straight line from *c* to *a*, and terminating at the point *a*, substantially as and for the purpose specified.

139,231.—*Base-Burning Stove.*—FREDERICK W. BORN, Cleveland, Ohio. Application filed February 7, 1873.

Claim.—A stove provided with a cone-shaped magazine, B, a fire-pot, A, of similar form, air-flue E, pipes C, and drum D, so constructed and arranged as to conduct the draft through the live fire, and thus consume the smoke, as described.

139,232.—*Nursery-Gate.*—JOHN W. BOUGHTON, Philadelphia, Pa. Application filed November 4, 1872.

Two racks are formed of vertical end bars, and horizontal rods arranged so that the rods slide in holes through the inner uprights, and have thumb-screws for adjustment. A supplementary bar is connected with one end, and is connected by a tightening screw or lever.

Claim.—A nursery-gate, formed of the sliding racks A B, rods *c d*, in combination with the thumb-screws *e e*, supplementary tightening-bar *l*, and tightening screw or lever, substantially as herein shown and described.

139,233.—*Reciprocating Steam-Engine and Saw-Mill Combined.*—ISAAC BROWN, Glenville, Md. Application filed April 9, 1873.

The piston-rod, projecting through both ends of the cylinder, is operated by side rods moving in guides in the side of the cylinder. The side rods are provided with pins, to which the connecting-rod with forked end is attached, and connects below the cylinder to the crank of the saw-arbor. The side rods are connected together by a cross-head at one end and a U-shaped connection at the other.

Claim.—The combination of a steam-cylinder, detached piston-rod, cross-head, and forked connecting-rods, as described.

139,234.—*Moccasin-Boot.*—EDWARD A. BUCK, Bangor, Me. Application filed January 28, 1873.

One side of an ordinary moccasin is left open where the seam is usually made. A flap or welt is sewed to one side of the front quarter, and one side of the back quarter is inserted in the pocket thus formed.

Claim.—In combination with a moccasin of the ordinary boot-pattern, as shown in the drawing, having one side seam left open and unstitched, the lap-welt or flap *c*, attached and arranged as set forth and shown, to cover said opening, as and for the purposes described.

139,235.—*Steam Vacuum-Pump.*—WILLIAM BURDON, Brooklyn, N. Y. Application filed August 9, 1872.

Two water-cylinders and their connected pistons are arranged with valves to admit steam to each cylinder above its piston, and afterward exhaust said steam into the cylinders. Hollow perforated pistons retain part of the water until it is expelled, when the water remaining in the pistons condenses the steam. Additional cups, also perforated, are arranged below the pistons to finish the condensation of the steam.

Claim.—1. The combination, with the two water cylinders or chambers and their connected pistons, of valves constructed and arranged to admit steam to each cylinder above its piston, and afterward to exhaust such steam into the same cylinder or chamber below its piston, substantially as and for the purpose herein set forth.

2. In combination with hollow pistons, the perforated water-receptacles, constructed for operation substantially as and for the purpose specified.

3. The combination, with the cylinder and hollow pistons, of perforated cups arranged below the pistons, substantially as and for the purpose herein described.

139,236.—*Friction Mechanism for Yarn-Beams.*—HELIM CHILSON, Ware, Mass. Application filed April 30, 1873.

The pressure of the friction-brake and band upon the wheel may be suddenly relieved, so as to admit of the ready forward or backward movement of the yarn-beam.

Claim.—1. The combination of the brake D, the lever F, and the friction-band B, arranged as set forth.

2. The combination of the screw C and nuts *b c*, the brake D, the lever F, and the friction-band B, arranged as represented.

3. The combination of the clamp-jaw *a* E, the screw C, the nuts *b c*, the brake D, the friction-band B, and the lever F, all being arranged and applied together substantially in manner, and to operate with the yarn-beam head or wheel A of a loom, as stated.

139,237.—*Device for Teaching Drawing.*—ADELIA C. COVELL, New York, N. Y. Application filed March 6, 1873.

Regular and irregular figures, plain or solid, formed of wire, are provided also with projecting wire axes, to indicate to the pupil copyist more distinctly its exact position and perspective.

Claim.—1. The combination, with the device A, of the wire B, substantially as and for the purpose described.

2. The combination, with the device A, of the wire C, substantially as and for the purpose described.

3. The combination, with the device A, of the wires C and D, substantially as and for the purpose specified.

4. A device for teaching perspective outline-drawing, composed of a series of different-colored wires, or wires formed of different metals, combined substantially as described.

139,238.—*Heel-Stiffener.*—LUTHER C. CROWELL, Boston, Mass. Application filed March 19, 1873.

Claim.—As a new article of manufacture, a heel-stiffener, composed of two pieces, having notched and thin edges, as set forth, and united as described.

139,239.—*Manufacture of Bleaching-Liquor.*—HENRY DEACON, Widnes, England. Application filed May 16, 1873.

Chlorine gas is passed into water in which is mixed precipitated carbonate of lime, such as results from causticising carbonate of soda. Other carbonates may be employed. The resulting liquor may be used for bleaching or for making chlorate of potash.

Claim.—1. The use of carbonate of lime, such as lumps of limestone or of chalk or of carbonate of lime in a state of fine division, such as that which is obtained by causticising solutions of the carbonates of soda and of potash by means of lime, for the absorption of chlorine, as herein described.

2. The employment of carbonates of lime in a similar manner for the purpose of absorbing chlorine when the chlorine is mixed with carbonic-acid gas, or is otherwise diluted.

139,240.—*Tool for Cutting Leather.*—JACOB DEMAREST, Belleville, N. J. Application filed February 10, 1873.

The divided clamp is applied, one section on each side of the blade to be held, and screwed into the ferrule until the blade is firmly clamped.

Claim.—As a new article of manufacture, a hollow handle, *a*, provided with ferrule *b* and divided clamp *c*, constructed and operating as described, so that the blade *c* can be adjusted back and forth.

139,241.—*Vault-Cover.*—JAMES C. FRENCH, Chicago, Ill. Application filed November 21, 1872.

Claim.—The ribs C C, in combination with a vault-light, for the purpose of strengthening the iron plate, substantially as described.

139,242.—*Machine for Jointing and Planing Staves.*—ROBERT W. GEORGE, Boston, Mass., assignor to CHARLES P. GEORGE, same place. Application filed May 8, 1873.

The staves are carried through the machine by dogs attached to an endless chain passing, first, under the revolving cutter which forms the outside, thence between the jointers, and then over another cutter which shapes the inside.

Claim.—1. In a stave-jointing machine, the dog D made with the cross-head D″ and combined with the feed-chain E and table B, substantially as described, and for the purpose set forth.

2. In a stave-jointing machine, the compound adjustable cam K^2 K^3, operating substantially as described, and for the purpose set forth.

3. The combination of the planer cutter-head H^2 with the frame H^4 H^5 and the eccentric H^7, operating substantially as described, and for the purpose set forth.

4. The self-centering guides F F and F^4 F^4, Fig. 1, operating substantially as described, and for the purpose set forth.

5. The vibrating pivoted frame L^2, carrying the cutter-head and shaft L^3 L^5, in combination with the sliding frames L and cams K^2 K^3, substantially as and for the purpose specified.

6. The adjusting-screw L^{12}, in combination with the sliding frame L and cams K^2 K^3, substantially as and for the purpose set forth.

7. The combination of the revolving cutter-head H^1, feed-chain E, jointing-cutters L^3 N^3, cams K^2 K^3, and vertically-adjustable rotating cutter-head H^3, all being constructed and arranged as and for the purpose herein shown and described.

139,243.—*Railway Freight-Car.*—RICHARD H. GORDON, Sr., Cleveland, Ohio. Application filed March 24, 1873.

The car is provided with an inner and outer door. The latter is held against the side of the car by means of a T-shaped fastening device. The inner wall of the car is provided with hinged sections to allow of the escape of grain which has worked between the sheathings.

Claim.—1. The car-hook F having a screw-stem, in combination with the railway car-door B having the lugs *c b*, substantially as set forth.

2. The guard I, having the lugs *c c* secured to the inner side of the doorway-frame by means of the cross-hooks A′, substantially as set forth.

3. In a railway freight-car constructed with wainscoting, the lower hinged section I of the wainscoting, substantially as and for the purpose specified.

4. A railway freight-car constructed with wainscoting, having the lower sections I′ thereof hinged to the side of the car, to allow of their being opened, for the purpose specified.

139,244.—*Door and Bit of Puddling and Boiling Furnaces.*—JOHN G. HABERFIELD, Wheeling, W. Va. Application filed March 24, 1873.

The roller guides the door when raised or lowered. The slides upon the inner vertical sides of the door-frame engage with corresponding slides upon the door, supporting and locking it when in place. The bit is triangular, having beveled edges to fit like sides and edges in the door to which it is keyed.

Claim.—1. The combination, consisting of the door-frame A, provided with the door-slide plates G, whether with or without the catch A, and the door B provided with slide plates or bars to correspond with those on the frame, as herein specified.

2. The combination of the door B and the door-bit L, the latter constructed and adjusted to the former, as herein described.

3. The combination of the door-frame A, door B, and the roller F, as herein specified.

139,245.—*Sewing-Machine.*—THOMAS HENDERSON and WILLIAM G. WRIGHT, Hamilton, Canada. Application filed February 21, 1873.

The shuttle-thread is moved, as described, to prevent it from becoming twisted.

Claim.—1. A shuttle, H, arranged within the circular race G, and adapted to have a continuous rotary movement, combined and operating in connection with the thread-shifter J, substantially as described, whereby the shuttle-thread is moved to the right and left of the shuttle as the shuttle revolves in its race.

2. The shuttle H, circular race G, thread-shifter J, and spring *s*, in combination with the cam L and gears N O, substantially as and for the purpose specified.

139,246.—*Rolling-Mill.*—HENRY R. HINKLEY, Milton Junction, Wis. Application filed March 11, 1873.

A pair of horizontal rolls, the lower one of which can be worked vertically, as its journals rest in the short arms of cam-levers. The levers are cam-shaped under the bearings of the rolls, and the frame of the machine is made to correspond. A foot-lever works the long arms of the levers.

Claim.—The combination, in a rolling-mill, of the cam-levers, having variable fulcrums, with the lower roll, substantially as and for the purpose set forth.

139,247.—*Self-Rocking Cradle.*—CARL HOLTZ, St. Louis, Mo., assignor to JOHN H. VORNBROCK, same place. Application filed November 15, 1872.

The cradle, arranged upon its frame and furnished in its end with spring and gearing like or similar to clock-work, is attached to a graduated crank or arm connected with the driving-wheel and cradle, by which motion is imparted to the swinging or suspended cradle.

Claim.—The combination of the arm *g*, crank or wheel G, clock-work mechanism herein shown and described, standard parts *a* a^1 a^2, angle-braces H, and pivoted cradle B, all constructed and arranged to operate as set forth.

139,248.—*Machine for Cleaning Grain, Nuts, &c.*—JOSEE JOHNSON, New York, N. Y. Application filed February 20, 1873.

Cleaning-cylinder suspended by and in the belts which rotate it.

Claim.—The cylinder *a*, suspended by, mounted in, and driven by, the belts *b b*, substantially as and for the purposes described.

139,249.—*Tuck-Creaser for Sewing-Machines.*—WILLIAM D. KANE, Chicago, Ill. Application filed October 23, 1872.

Claim.—As an article of manufacture, a tuck-creaser, consisting of the plate A, having the backwardly-inclined lip B, the spring C *e*, and spring-arm D, formed as shown, the end E of the arm acting to move the cloth down on the lip, and compress and crease it over the end of the spring, all as described.

139,250.—*Machine for Making Horseshoe-Nails.*—EDWARD W. KELLEY, Lowell, Mass. Application filed November 11, 1872.

A pin on each of the movable jaws enters an oblique slot in each of the transverse bars *i*, and the latter are reciprocated by contact of their projecting extremities with fixed stubs on the frame, and the stationary jaw, being located on a surface inclined to that of the other jaw, permits the stationary jaw to be sharpened when required, and yet preserve its relationship to the other jaw.

Claim.—1. The combination of the clipping-wheel *k*, jaws *g g*, grooved bar *i*, and inclines or rollers *o*, as and for the purpose specified.

2. The arrangement of the jaws *g* and *q*, of each pair, on anticlinal surfaces of the wheel *k*, as and for the purpose set forth.

139,251.—*Loom-Filling Fork.*—JACOB H. KNOWLES, Lawrence, Mass. Application filed August 2, 1871.

Claim.—The new manufacture of filling-fork, composed of the two wire forks, constructed, arranged, and combined together in manner substantially as specified.

139,252.—*Dish-Pan.*—SUSAN L'AFFERTY, Chicago, Ill. Application filed April 26, 1873.

The pan is divided into two compartments, and in one of them a rack is placed to receive the dishes to be drained. The compartments are provided with faucets to draw the water off.

Claim.—The pan *a* divided into compartments, in combination with a suitable rack for draining the dishes, substantially as set forth.

139,253.—*Harness-Buckle.*—CHARLES C. LEE, Falls Church, Va. Application filed February 13, 1871.

The buckle is of a shape that can be cast without a core, and is to be riveted to the strap.

Claim.—The harness-buckle above described, constructed with the bed-plate A, stationary tongue B, loops C C, extending beyond said bed-plate, so that the whole may be cast in one piece without cores, and holes through said bed-plate, whereby the buckle may be secured to the strap by rivets *a'*, and without sewing.

139,254.—*Hook for Hanging Flower-Pots, &c.*—IRA A. LOVEJOY, Lynn, Mass. Application filed April 11, 1873.

The two upper rods of the bracket are furnished with eyes which pass over screw-heads upon the window-seat. The lower or brace rod rests with a broad surface against the wall without defacing it.

Claim.—The suspending-hook hereinbefore described, composed of the bent rod *a a' a''* and the bracing-rod *b b'*, said rod *b b'* being prevented from marring the window-frame by means of the plate *c* or equivalent device, as and for the purpose above set forth.

139,255.—*Lamp-Lighting Apparatus.*—MICHAEL A. LYNCH, Boston, Mass. Application filed March 6, 1873.

The discharger, pivoted a little above its center, is operated by a bell-crank through the medium of a connecting-link. Upon the end of the shaft is a single tooth for raising the fuse.

Claim.—The shaft *g*, its tooth *i*, and crank *f*, the connecting link *e* and the lever or discharger *d*, constructed and arranged together and with the fuse-tube *a*, substantially as and to operate as described, such fuse-tube and shaft being applied to a lamp-burner, as represented.

139,256.—*Heating-Stove.*—DARWIN N. MASON, Indianola, Iowa. Application filed January 10, 1873.

Claim.—The combination of the air-chamber below the fire, formed by the turret B and the false bottom C, and the tubes *c c c d d d*, with the upper air-chamber, formed by the plate D and the cap E, and the ventilator A, substantially as and for the purposes hereinbefore set forth.

139,257.—*Grain-Cleaner.*—STEPHEN MOORE, Rochelle, Ill., assignor of two-thirds his right to M. D. HATHAWAY and E. GARDNER, same place. Application filed February 26, 1873.

Foul stuff and light substances are separated from the grain while passing through the hopper, drawn up into the fan-case, and expelled through the spout D by the suction-fan.

Claim.—The arrangement of the horizontally-revolving fan C upon a vertical fan-shaft in the case A, in combination with the spout D, box E, hopper H, flue G, and slides I J, all constructed and arranged substantially as shown and described, and for the purposes herein set forth.

139,258.—*Reciprocating Steam-Engine.*—ROBERT G. NICOLL and GERWARD H. HOLLMANN, Hazelhurst, Miss. Application filed July 27, 1872.

The steam-valves, of the puppet kind pivoted to a rocking-lever, and are provided with steel-pointed blunt pins extending through the cylinder, and are operated by the piston. The valves are double-seated, and have the usual wings. A hollow piston and rod form an exhaust-outlet. The steam is admitted to said outlet by projecting valves in the piston, which are actuated by coming in contact with the cylinder-heads.

Claim.—1. A steam-valve provided with bearing on top of seat, and plug H having flat head L resting on the bottom thereof, as described.

2. A cylinder having lift-valves B B to admit steam, combined with a piston having means M N Q for exhausting steam, as described.

139,259.—*Tag-Machine.*—CORNELIUS M. O'BRIEN, Hightstown, N. J. Application filed August 10, 1872.

A strip of paper is divided longitudinally in its passage by a pair of constantly-operating shears, the separated strips being fed forward by intermittingly-moved rollers. A type-platen, descending, prints the ends of one pair of tags, while a cutting-bed attached to it presses the tags previously printed upon the circular-shaped knives, one adjustable to vary their size, which sever the tags from the strip.

Claim.—1. The frame J, carrying the type and cutting-bed, in combination with the adjustable knives M', substantially as described.

2. In a tag-machine, the combination, with the shears C, cam a^1 and spring a^2, of the feed-rollers b^1 b^2, shaft F, cam c^2, and the intermittent clutch *c*, substantially as specified.

3. In a tag-machine, the combination, with the slotted bed, and the operating-cam a^1 and spring a^2 arranged under said bed, of the shears, vertically and longitudinally arranged in the central line of the bed, and working through its slot, substantially as and for the purpose specified.

4. The inking-rollers K^3 attached to the pivoted block L, in combination with the beveled stop L^1, springs L^2, and supply-rollers L^4, substantially as described.

5. In combination with the shears C, arranged to divide the paper to form the ends or butts of the tags, the knives M M', the latter adjustable, as shown, bent to cut the tops, sides, and corners of two tags simultaneously, substantially as specified.

6. The adjustable frame m^1, recessed blocks m^2, screws P, frame O', and adjusting-screw O, in combination with the bar m^1, substantially as specified.

139,260.—*Nut-Lock.*—ALBERT PORTER, Chicago, Ill. Application filed March 29, 1873.

Claim.—The perforated locking-plate, bent and arranged so that the extreme ends shall lock the inside nuts, while the ends formed by the bend shall lock the outside nuts, for the purpose herein explained.

139,261.—*Inkstand.*—WILLIAM READ, Jr., Cambridge, assignor to WILLIAM READ, Boston, Mass. Application filed October 4, 1872.

The bottom of a square bottle is raised from side to side, providing two ink cavities, so that in use the ink free from sediment may be projected into the dipping or forward cavity. A block on one side carries an elastic band as a pen-holder, and is mounted with a pin to hold the cork.

Claim.—1. An inkstand or bottle having its bottom divided into compartments *c c'*, substantially as and for the purpose specified.

2. An inkstand or bottle having a pen rest, *f*, formed with projections *f' f'*, and provided with an elastic band or spring, *g*, substantially as specified.

3. An inkstand or bottle having a pen-rest, *f*, provided with a cork or stopper support, *k*, substantially as described.

139,262.—*Hanging Signal-Cord of Railroad Cars.*—JOHN F. RICE, Fitchburg, Mass. Application filed March 10, 1873.

A pulley or spool is attached at each end of the car to the ceiling, upon which is wound either end of the cord extending through the car. The connections between cars are made by separate cords attached to and wound upon the adjacent spools, the object in view being the avoidance of the inconvenience of having a continuous cord to be passed through each car.

Claim.—A series of signal cords *d s* connected indirectly with each other by a series of spools or pulleys around which they are wound, so as to operate substantially in the manner and for the purpose described.

139,263.—*Hand-Pump or Syringe.*—WILLIAM B. ROBINS, No. 17 Richmond Terrace, Shepherd's Bush, Middlesex, England, assignor to EDWARD HAYNES and HENRY HAYNES, Edgeware Road, England. Application filed February 21, 1873.

The outer tube communicates with the induction-pipe, so that when the piston is making its down-stroke water rushes up the outer tube and through the openings in the top of the barrel, filling the barrel above the piston. On the upstroke, the openings in the piston being uncovered, this water rushes into the space below the piston; thus the lift is divided between the up and the down stroke, while water is expelled only during the latter.

Claim.—1. The combination of the barrel, the outer tube, the hollow piston-rod, and the tubular handle, substantially as before set forth.

2. The combination of the barrel, the outer tube, the hollow piston-rod, the tubular handle, the traversing-piston, and the valves, substantially as before set forth.

139,264.—*Saw-Mill Head-Block.*—ALEXANDER RODGERS, Muskegon, Mich. Application filed May 3, 1873.

The log is secured upon the carriage by a pair of peculiarly-arranged dogs, and is then moved forward upon the head-blocks by a setting-jack, which is operated by two reciprocating racks acting upon a series of pawls attached to the jack, the extent of the movement being regulated by a partially-rotating gage, against which the racks strike in their reciprocations.

Claim.—1. The dogs N and M', in combination with their operating mechanism and the setting-jack C, substantially as and for the purpose specified.

2. The chain-tightener T, constructed and operated substantially as herein shown and described.

3. The slide-dog S, constructed and operating substantially as and for the purpose herein set forth.

4. The setting-shaft D, fusee E, and chain *e*, in combination with the setting-jack C, substantially as and for the purpose specified.

5. The gage-cylinder F, in combination with the setting-racks *b* and *b'*, and the indicator A, and movable arc A', as and for the purpose described.

6. The reciprocating racks *b* and *b'*, and their operating mechanism, in combination with the stationary rack *a*, substantially as specified.

7. The rack G, constructed as shown and described, in combination with the eccentric *p* and pawls *n m*, as set forth.

8. The setting-jack C, provided with the two sets of dogs S and M M', and the mechanism for operating the same, in combination with the block B and carriage A, all the parts being constructed and operating substantially as and for the purpose specified.

139,265.—*Floor-Clamp.*—JOHN G. ROGERS, Niles, Mich., assignor to himself and SILAS S. WHITE, same place. Application filed February 17, 1873.

One of the levers is curved, and is operated by the pin in lever E and retained in position by it.

Claim.—The floor-clamp, consisting of the levers A A, one of which is curved at the point of contact with pin F, the lever E, cross-bar G, brace H, and adjustable U-shaped yoke D, all constructed, arranged, and combined as and for the purposes set forth.

139,266.—*Writing-Tablet.*—AUGUST SCHINDLER, Lancaster, Pa. Application filed February 18, 1873.

Paper coated with a composition of sixteen parts alcohol, two and one-half parts gum sandarac, one part white shellac, and one and a quarter castor oil.

Claim.—The specified transparent composition for coating white paper-tablets, substantially in the manner and for the purpose specified.

139,267.—*Self-Waiting Table.*—JOHN F. SCHULTZ, Chicago, Ill. Application filed March 18, 1873.

A stationary frame, combined with a central revolving and vertically-adjustable top, and an outer detachable rim. The spindle of the adjustable top rests on a lever that is connected by a cord with a rod that passes out to one side of the table. Said rod has a ratchet near its outer end, with which a pawl attached to the frame of the table engages. The end of the rod has a milled head.

Claim.—The combination of the ratchets *g*, pawl *h*, rod *f*, cord *e*, bridge-tree *d*, and spindle *c* with the stationary frame, central revolving and vertically adjustable top, and outer detachable rim, as described.

139,268.—*Harvester.*—JOHN F. SEIBERLING, Akron, Ohio. Application filed November 20, 1871.

Devices are arranged to enable the driver to rock the finger-beam by raising or lowering the front end of the main frame. By lifting the coupling-frame the outer end of the finger-beam is raised by means of a ratchet-link connecting the heel of the finger-beam with the main frame. The reel is supported on an adjustable lever and provided with devices for regulating the tension of the driving-band. The cut-off is pivoted near the fulcrum of the reel-supporting lever.

Claim.—1. The combination of the main frame oscillating on the main axle, the tongue hinged to the front inner corner of said frame, the lifting-lever pivoted on the frame and linked to the tongue, the locking detent, the hinged coupling-frame, and the finger-beam, these members being constructed and operating substantially as hereinbefore set forth, to rock the guard-fingers.

2. The combination of the oscillating main frame, hinged tongue, coupling-frame, and finger-beam with the lifting-lever link and chain, these members being constructed and operating substantially as hereinbefore set forth, to rock and lift the inner end of the finger-beam simultaneously by a single lever.

3. The combination of the main frame hinged tongue, coupling-frame, finger-beam, lifting-lever and chain, with the ratchet-link hinged to the finger-beam and acting on the main frame, these elements being constructed and operating substantially as hereinbefore set forth, to lock and tilt the finger-beam.

4. The combination of the reel-post, the pivoted supporting radius-arm, the lever pivoted to the arm, and the reel mounted on the lever, these elements being constructed and operating, substantially as hereinbefore set forth, to render the fulcrum of the lever adjustable.

5. The combination of the reel, its supporting-lever, and pivoted supporting radius-arm with the guide-rail on the reel-post, and a guide-pin on the lever, these parts being constructed and operating in combination, substantially as hereinbefore set forth, to secure the proper relation between the supporting-lever and reel-post.

6. The longitudinally-adjustable sectional tension-arm constructed with a guide-rail and ferrule, and operating substantially as set forth.

7. The combination of the tension-arm, vibrating around the reel-driving axle, with the guide *r* on the reel-post, substantially as hereinbefore set forth.

8. The combination, with the adjustable reel, of the cut-off pivoted near the fulcrum of the reel-supporting lever, substantially as hereinbefore set forth.

9. The combination of the reel, the supporting-lever, the cut-off hinged near the fulcrum of the lever, and the dropping platform, substantially as hereinbefore set forth.

139,269.—*Corn-Planter.*—HIRAM A. SHARP, Harlem, Mo. Application filed March 3, 1873.

A rectangular frame has a pair of carrying-wheels in front and one behind; on each end of its axle a revolving marking-arm. In the middle of the frame is the hopper, and beneath it the spout, opener, and coverer. Seed-slide operated by cam on the hind wheel.

Claim.—1. In combination with a seed-delivering apparatus constructed with two slides, N and P, one traversing above and the other below, the perforated stationary plate J, the movable block *a*, constructed and arranged to operate substantially as described, for the purpose set forth.

2. The marking-arms H H, arranged on the rear axle F, to mark in the tracks of the fore wheels E, so that the marks will not be obliterated by a shower of rain.

3. The spurs or projections on the wheel G, arranged each side of the tread of the wheel, in combination with the scraper I, provided with scores and prongs to clear projections and tread of the wheel.

139,270.—*Tag-Machine.*—JOHN H. SILVERS, Hightstown, N. J. Application filed May 29, 1872.

Improvement on No. 87,261. The knives for cutting the head of the tag are capable of adjustment, so as to cut different-sized tags. The paper is forced down upon them by a reciprocating bed operated in unison with the reciprocating printing-platen.

Claim.—1. The clipping device *n n* and reciprocating die *l*, in combination with the cam-wheel A, pin *r*, and arm S^2, substantially as and for the purpose herein specified.

2. The cutters *n n*, one fixed and the other adjustable by means of the slide *p* and set-screw *m*, in combination with a tag-printing device, substantially as and for the purposes herein specified.

139,271.—*Railroad Frog.*—HENRY J. SKINNER and SAM. J. GIFFORD, Dunkirk, N. Y. Application filed March 20, 1873.

The channels for the flanges are rounded at bottom, and shallow, so as to partially support the wheel, and co-operate with the curved wings to give an easy transition through the frog, where the change of direction of motion occurs.

Claim.—In a railroad frog the channel *a* rounded to conform to the shape of the flange of the wheel, and partially support the same, and the gradually-rising point from *b* to *c* used in connection with the curved rails B B, having the narrow throat at *b*, all constructed and arranged as and for the purpose specified.

139,272.—*Laying Concrete Pavements.*—JESSE W. SNYDER, Chicago, Ill. Application filed March 15, 1873.

Claim.—The method of laying concrete pavements, by molding the concrete, in connection with an iron frame having cross-bars with beveled projections on their under sides, which extend half way through the concrete, so that when the frame is withdrawn V-shaped grooves will be left in the concrete, to be filled with sand or other analogous material, in the manner and for the purpose specified.

139,273.—*Heel-Breasting Machine.*—VIVIAN K. SPEAR, Lynn, Mass. Application filed April 3, 1873.

The knife-carriage is susceptible of both lateral and vertical adjustment. The jack-carriage is pivoted at its rear end to a sliding bed, its forward end being slotted to admit of lateral motion, its extent being controlled by a pivot passing through the slot into the center of the sliding bed. The last portion of the jack is composed of three parts, a detachable heel-seat, an arm pivoted to the base of the jack and adjusted to the heel seat, and an extensible toe-piece.

Claim.—1. In a heel-breasting machine, the combination, with the vertically-moving breasting-knife, of a jack or jack-carrier movable upon a vertical pivot and adjusting devices, whereby the said jack when moved on its pivot may be adjusted and held in position to adapt the machine to the breasting of rights and lefts or straights, substantially as set forth.

2. In combination with the jack and the carriage *a*, to which the jack is jointed at *i*, as described, the jack-screws *k*, under the arrangement substantially as and for the purposes shown and set forth.

3. In machinery of the kind specified, a jack having a last portion constructed and mounted, substantially as described, so that the horizontal slope of the fore part may be varied with respect to the heel seat or post to adapt the jack to varying curvatures of soles, as set forth.

4. The combination of post *h*, arm *l*, and horn *n*, said parts being constructed and arranged for joint operation, substantially as herein shown and set forth.

5. In a heel-breasting machine, a jack provided with a detachable or removable heel-seat, substantially as and for the purposes set forth.

6. The combination, with post *h*, arm *l*, and horn *n*, of the movable or adjustable heel-seat *t* and movable or adjustable toe-rest *s*, substantially as and for the purposes shown and set forth.

7. The breasting-knife, combined with and applied to its stock, substantially in the manner shown and set forth, whereby either the vertical slope or lateral bodily adjustment of the said knife is varied, substantially as and for the purposes stated.

8. The combination, with the guide L and carriage *a*, of the stop-bolt *f'*, or its equivalent, essentially in manner and operating as stated.

139,274.—*Process of Making Artificial Stone.*—DANIEL M. SPROGLE, Annapolis, Md. Application filed October 30, 1872.

Process of making stone artificially by alternately subjecting the calcareous concrete to the action of carbonated vapor and a moderate degree of heat.

Claim.—The process of making artificial stone by alternately subjecting the calcareous concrete to the action of carbonated vapor and a moderate degree of heat, substantially as described.

139,275.—*Fire-Extinguisher.*—JEROME B. STILLSON, Chicago, Ill. Application filed October 5, 1872.

The acid-receptacle is made large enough to contain several charges, and is properly connected with the chamber containing the alkaline solution. A suitable valve allows of communication between the two. A gage, graduated to indicate the number of charges, is connected to the acid-receptacle.

Claim.—The acid-receptacle B, when provided with a valve, *a*, and gage *b*, in combination with the alkali-receptacle A, all constructed substantially as and for the purpose specified.

139,276.—*Railroad Rail-Joint.*—GEORGE A. STURGES, Delhi, N. Y., assignor to himself and DEXTER PETTINGILL, same place. Application filed May 2, 1873.

The joint is held by a metallic ring inclosing the convex splice-pieces, which are keyed up by driving in a broad flat wedge. The lips formed on the splice-pieces and on the wedge are then bent down to secure all in place.

Claim.—1. The combination, with convex splices B B B′, of a ring or circular tie, C, and a bifurcated wedge, D, substantially as described.

2. The lips *a a* formed on the upper beveled side of the splice B′, in combination with the splices B B, ring C, and wedge D, substantially as described.

3. The splices B B constructed with lips *b b*, and combined with the rail sections notched at *b′ b′*, and with ring C and base-splice B′, substantially as described.

4. The base section B′, recessed or notched at *d d′*, in combination with wedge D lipped at *d d*, and with the ring C, substantially as described.

139,277.—*Insect-Destroyer.*—SHERMAN W. THOMAS, North Royalton, Ohio. Application filed 21, 1873.

The frame is mounted upon a wheel upon one side and a runner upon the other, the runner passing close to the row of plants. A pendent striker is operated by means of a crank and connecting-rod, which gives a sudden blow to the plants, thus knocking the insects into the pan, and thence between the rollers, where they are crushed.

Claim.—The combination of the beater K, lever H, link J, pitman I, gearing D F, rollers N E, drive-wheel B, and shoe R, in the manner as and for the purpose set forth.

139,278.—*Pocket Car-Ventilator and Dust-Screen.*—JOHN B. TIMBERLAKE, Salem, Ohio. Application filed March 1, 1873.

The screen is made of two pieces of pasteboard covered with cloth and hinged in the middle. To it is pivoted an arm having an oval belt attached to one end and a rubber band and metallic hook attached to the other. When in use the belt is placed between the two window-strips, the arm is brought down level, and the hook fastened on the outer edge of the screen. The whole can be folded up in compact form.

Claim.—The combination of the screen, the arm, the metallic belt, the metallic rivet, the rubber band, the metallic hook and staple, as shown, and for the purpose described.

139,279.—*Railroad Switch.*—CHARLES D. TISDALE, Boston, Mass. Application filed December 17, 1872.

The approaching train throws the switch into line with the main track if wrongly placed, and accomplishes the result through a lever and rod by the side of the track, which operate the spring-stop H pivoted to the top of the switch-bar, thus allowing said bar to move back upon the slots *f f*, under the stress of the spring D. The switch is set for the siding by means of the crank-shaft.

Claim.—The combination of the spring D, the cranked shaft E, bars F G, lever H, the spring K, rod I, and lever L, all applied to or combined with a switch and its turnout and main-track rails, as and for the purpose set forth.

139,280.—*Cigar-Machine.*—HANS E. TYLANDER, Keokuk, Iowa. Application filed February 12, 1873.

The leaf is fed in upon a guide-apron and wrapped around a roughened spindle, then pushed along between forming-rollers, where the cigar is shaped and receives the wrapper.

Claim.—1. The wrapping-spindle H and guide-apron G in a cigar-machine, substantially as set forth.

2. The combination of wrapping-spindle H and forming-rollers N N′ N² in a cigar-machine, as set forth.

139,281.—*Sash and Door Clamp.*—THOMAS S. UNIK, Hubbardston, Mich. Application filed November 16, 1872.

One side is fixed and the other three adjustable by means of levers, slides, and lazy-tongs, which are made fast by the pawl and rack on lever F.

Claim.—1. The combination of the lever F, movable frame pieces B C D, and fixed frame piece A with the lazy-tongs *f f* and braces A A, all arranged substantially as herein shown and described.

2. The extension guides *d e* and *i j*, in combination with the subject-matter of the foregoing clause.

139,282.—*Securing Pulley to Shaft.*—WILLIAM B. VAN VOORHIS, New York, N. Y. Application filed November 14, 1872.

An eccentric clutch secured in the hub of the pulley, arranged to bind the pulley to the shaft.

Claim.—The clamping cam-lever C arranged to fit loosely within the socket *b* in the hub or corresponding portion of the device to be attached for automatic hold on the shaft, substantially as specified.

139,283.—*Pantaloon-Tree.*—ELLEN B. VIETS, Boston, Mass. Application filed March 15, 1873.

A press-block on which to shape pantaloons.

Claim.—1. In a pantaloon-tree the separate thigh-part A, the rear leg and ankle part *c*, and front leg and ankle portion B, all arranged to operate together substantially as described.

2. The parts B and C, provided respectively with the swell *d*, and corresponding concavity *e*, in combination with the expander *d*, substantially as and for the purpose described.

3. In combination with the thigh-part A and leg-part B, the part *c*, constructed and arranged to extend up between the parts A and B, and below and against the portion A, all essentially as shown.

4. The pantaloon-tree composed of the separate thigh-part A, the ankle and leg parts B C, and the expander D, constructed and arranged substantially in the manner and for the purpose as specified.

139,284.—*Scroll-Saw.*—EDWARD A. WALKER, Minneapolis, Minn. Application filed March 31, 1873.

The saw is attached to the lower cross-head by two wedge-shaped jaws operated by a set-screw, and is connected at the top to a peculiarly-formed straining apparatus.

Claim.—1. The saw-clamp, composed of the combination of the triangular case D, triangular jaws *d d*, and set-screw *d′*, substantially as and for the purpose shown and described.

2. The combination of springs *h* and *h*², vibrating arm I, and links *i i* with the flexible band *i′* and saw E, substantially as and for the purpose described.

3. The combination of the springs *h* and *h*², vibrating arm I, and links *i i*, flexible band *i′*, and saw E with the sliding adjustable frame H, substantially as and for the purpose described.

4. The combination of the temper-screw *h*‴, sliding block *o*, and spring *h*² with the vibrating arm I, links *i i*, and spring *h*, substantially as and for the purpose described.

139,285.—*Paper-Clip.*—M. ALLISON WHEELER, San Francisco, Cal. Application filed March 5, 1873.

A metallic tube, longitudinally split, is forced over the edge of a board, and its under edge attached thereto, while the upper is left free to clamp the paper with equal pressure by reason of openings in its side.

Claim.—A clip or holder formed of the single elastic cylindrical piece C having the openings made so as to leave the side and central strips E and F, when the whole is constructed, to operate substantially as and for the purpose herein described.

139,286.—*Lubricator.*—HENRY V. AIKEN, Gibsonburg, Pa. Application filed April 12, 1873.

A drip-cup formed on the body of the lubricator, below the middle oil-chamber, to receive the waste escaping from the cock and reservoir.

Claim.—The lubricator as constructed, having the oil-drip cup formed with the body of and surrounding the central oil-chamber C, as and for the purpose set forth.

139,287.—*Journal-Box.*—JOHN A. ALTHOUSE, New Harmony, Ind. Application filed February 15, 1873.

The sectional box which incloses the shaft is tightened by means of wedges and set screws when, from wear or other cause, it has become loose.

Claim.—The sides C D, provided with flanges F F, lips H H, and inclined edges, combined with screw I, inclined blocks J, and pillow-block G, as and for the purpose described.

139,288.—*Artificial Fuel and Methods of Burning the same.*—ALFRED BERNEY, Jersey City, N. J. Application filed May 17, 1873.

Claim.—1. The improved processes herein described for combining, mixing, and using anthracite coal-dust, slack or screenings, with or without bituminous coal-dust or other fuels, to generate heat in railroad-locomotive furnaces, substantially as described, and for the purpose set forth.

2. The improved processes herein described for using anthracite coal-dust, slack, or screenings, alone or with anthracite coal, in railroad-locomotive furnaces, as set forth, or in any other furnaces.

3. The processes herein described, alone or in combination, for the purpose of economizing fuel and burning anthracite coal-dust in railroad-locomotive furnaces or other furnaces, substantially as described, and for the purposes set forth.

4. The combination of a hot-air chamber with water-grates and other grates, a feed-water heater, a superheater, a spark, steam, smoke, heat, and oxygen conductor with a furnace, so as to burn anthracite coal-dust or screenings, alone or with other coals or bituminous dust, to generate heat, as described, and for the purpose set forth.

139,289.—*Dust-Conveying Attachment for Thrashing-Machines.*—JACOB BIERBOWER, Philadelphia, Pa., assignor of one-half his right to AARON KAUFFMAN, same place. Application filed December 17, 1872.

Perforated tubes so arranged as to draw the dust arising from the thrashing-machine (by means of a suction-fan) from the front, rear, and sides of the machine into a fan-case, from which it is discharged through a wind-trunk to any desired point.

Claim.—In a dust-conveying attachment for thrashing-machines, the combination of the fan, perforated tubes C C, and trunk F, substantially as and for the purpose described.

139,290.—*Hinge.*—HENRY D. BRADLEY, Forrestville, Conn., assignor to THE BRISTOL BRASS AND CLOCK COMPANY, same place. Application filed May 9, 1873.

One leaf is formed with its edge coiled to form the pintle-eye in the usual way. The other leaf is slotted near one edge, and portions of it are swaged in one direction, and of the size to receive the pintle, and the remaining alternate portions swaged in an opposite direction, and left of a size to receive the eyes of the other leaf. At the edge the metal is left solid to form a stop to prevent the hinge being too widely opened.

Claim.—The improved stop-hinge herein described, consisting of the ordinary leaf A, pintle *c*, and the leaf B, formed with the sockets 2 2, 3 3 3, and stop *b*, as and for the purposes set forth.

139,291.—*Railroad Frog.*—JAMES BRAHN, Jersey City, N. J. Application filed April 26, 1873.

The brace-bars maintain the point in place by connection with the rails. The U-shaped bars brace and strengthen the inner angles of the frog similarly.

Claim.—1. The brace-bars G, in combination with the point C and guard-rails B of the frog, substantially as herein shown and described.

2. The U-shaped bars H, in combination with the rails of the tracks and with the rails of the frog, at either or both ends of said frog, substantially as herein shown and described.

139,292.—*Automatic Fire-Alarm.*—HENRY L. BROWN, Middletown, Conn. Application filed March 15, 1873.

The detent-lever of a wound-up alarm-bell mechanism is connected with the arm of an inflated bellows or air-chamber, which is in air-tight connection with a tube of fusible metal running through the rooms to be protected. On the melting of the closed tube by a fire at any point the escape of air collapses the air-chamber, and the alarm is sounded.

Claim.—The combination of a collapsible air-holder, a lead or other fusible pipe, D, a lever, I, a spring, J, a detent, K, and an alarm mechanism, substantially as specified.

139,293.—*Musical Instrument.*—MARSENA CANNON, Salt Lake City, Utah Ter. Application filed March 22, 1873.

Claim.—The keys C and coiled wires B, relatively arranged as specified, for the purpose set forth.

139,294.—*Apparatus for Reproducing Motion.*—CHARLES T. CHESTER, Englewood, N. J. Application filed May 13, 1873.

A cylinder having a piston connected at one end by a pitman with crank-wheel and pin, securing reciprocating motion of the piston, which forces compressed air through a pipe to another similar cylinder, the piston of which is connected with a ratchet-wheel and pawl by means of a lever, producing intermittent rotary motion.

Claim.—1. The reproducing of a reciprocating motion, substantially in the manner, by the means and for the purpose specified.

2. The combination of the cylinder and piston A C, and the actuating mechanism E D *a*, with the cylinder and piston B H, as and for the purpose specified.

3. The combination of the mechanism last above claimed with the wheel I, lever J, and pawl L, as and for the purpose specified.

139,295.—*Combined Umbrella and Cane.*—T. R. LAMBERT CHEVERS, Hoboken, N. J. Application filed March 29, 1873.

The top notch with the frame and cover unscrews from the stick, and they are inclosed in the hollow handle, which is used as a cane.

Claim.—1. The combination of the runners D G, ribs E, braces F, wire H having a head upon one end and a catch-loop upon the other end, the spring-catch hook I, and open hook-sleeve J with each other to adapt them for detachable attachment to the handle, substantially as herein shown and described.

2. The cover K provided with eyes L and open-ring springs M to adapt it for detachable attachment to the umbrella-frame, substantially as herein shown and described.

3. An umbrella having an end-threaded handle, A, an end-threaded runner, D, and an internally-threaded ferrule, C, as and for the purpose specified.

139,296.—*Fire-Proof Safe.*—NATHANIEL CONSTABLE, Carrollton, Ill. Application filed November 14, 1872.

The safe is inclosed within an air-chamber, the walls of which are provided with apertures and flues arranged so that, when the safe is heated, no matter what its position may be, a current of air is caused to pass through the air-chamber.

Claim.—The box A, air-chamber E, flues B B B B and C, apertures *a a a a a′ a′ a′ a′*, with space F, constructed and arranged as described, for the purpose set forth.

139,297.—*Soldering Compound.*—CARY COX, Covington, Ga. Application filed April 19, 1873.

Sal-ammoniac, one part; zinc, four parts; sulphate copper, one part; muriatic acid, twelve parts. This composition is allowed to stand twenty-four hours uncovered, and is then poured off the dregs, and three pints soft water added.

Claim.—A compound for soldering, composed substantially as described—that is to say, by combining muriatic acid, sal-ammoniac, sulphate of copper, zinc, and water, in about the proportions named.

139,298.—*Card-Rack.*—DELOSS A. DANFORTH and FRANK M. WINCHESTER, Elkhart, Ind. Application filed January 4, 1873.

Claim.—1. A card or picture rack made of a series of slats, A A, woven together edge to edge, and provided with narrower slats C C on the front side, substantially as and for the purposes herein set forth.

2. A card or picture rack made of a series of slats woven together edge for edge, and provided on the front side with narrower slats, as shown, all of said slats being warped and the rounding sides placed together, substantially as and for the purposes herein set forth.

139,299.—*Dovetailing-Machine.*—ASAHEL DAVIS, Lowell, Mass. Application filed February 6, 1873.

The cutters and guide-pulleys are placed upon adjustable stands, which are secured to an oscillating bar, the whole being so arranged that the cutters and guide-pulleys may be turned down below the level of the table, if desired.

Claim.—1. The bar A, provided with lugs at each end, in which are inserted the pivot-pins P, in combination with the frame E, having projections which receive the pivot-pins of the bar, substantially as described.

2. The adjustable stands K K′, in combination with the hinged bar A, as and for the purpose specified.

3. The cutter-shaft D, provided with the divided pulley O O, in combination with the stand K and bar A, as specified.

4. The guide-pulley L, provided with bushings, as shown, and carried upon the stud T, in combination with a supporting stand upon the bar A, substantially as described.

5. The guide-pulley L and driving-pulley O O upon the shaft D, in combination with the adjustable stands and hinged bar A, all the parts being constructed and arranged as and for the purpose specified.

139,300.—*Blast-Furnace Alarm Apparatus.*—EDWIN DAVIS, Millerton, N. Y. Application filed March 29, 1873.

To the forward edge of the cover is attached one end of a chain, which passes over guide-pulleys, the other end being secured to a weight which nearly counterbalances the cover. From the weight a second chain passes over a guide-pulley, down through an opening in the cover, and is attached to a small weight resting on the charge in the furnace. When the charge falls the last-named weight draws upon a cord attached to a lever, actuating the hammer of a gong. When the cover is raised the counterbalance-weight sinks, pulling the small weight out of the way of the fresh charge.

Claim.—1. The cover H, in combination with the furnace-top A, to cover that part of it outside of the air-heating chamber, as specified.

2. The combination of the chain I and balance-weight K with the cover H of the furnace-top A, substantially as herein shown and described.

3. The combination of the weight L, chains M O, lever P, chain Q, and spring, hammer, and gong, R S T, with the cover H and balance-weight K, substantially as herein shown and described.

4. The combination of the weight L, cords, lever, and gong, as and for the purpose specified.

139,301.—*Wash-Boiler.*—JOHN W. DEMIKO, Paris, Me. Application filed April 29, 1873.

The wash-boiler is constructed with a bottom, resting upon supports attached to the sides of it, with openings covered with a valve upon its under side, and upon the upper side with stripe, upon which rest a perforated cover or bottom. At each end are conducting-pipes for water and steam supported upon a raised flat top chamber or steam chest.

Claim.—In a wash-boiler, the combination of the perforated bottom G, supported upon the cross-strips *c*, with the chamber H and the flat top end steam-chests D, the valved bottom C, and the exit-pipes E, the several parts being arranged to operate as described.

139,302.—*Electro-Magnectic Telegraph.*—GEORGE D'INFERVILLE, New York, N. Y. Application filed August 10, 1872.

The line-wire is in connection with the similar poles of the two batteries at its extremities, so as to neutralise the current when both keys are down. Local relays are in action when the main wire is interrupted, recording the interruptions from simultaneous depression of the opposite keys, the object being to transmit messages simultaneously in opposite directions.

Claim.—1. The connection of one line-wire with the similar poles of two batteries, as and for the purpose set forth.

2. The combination of the relay B having the two screws *p* and *q*, with the lever D having the pins *f f*², and with the springs *d d*² and plates *g g*², substantially as herein shown and described.

139,303.—*Grain Rake and Loader.*—GEORGE S. DUDLEY, Dixon, Cal. Application filed November 9, 1872.

The cut grain is raised from the ground by dragging teeth, when it is lifted by rotating teeth to the elevator-apron, which carries it to the receptacle.

Claim.—1. The combination of the slotted bars B, pivoted teeth C, guides E, shaft H, arms I, elevator J K L, guides W, and carrier S U V with each other, and with the frame-work of the machine, substantially as herein shown and described, and for the purpose set forth.

2. The combination of hook X, lever Y, the sliding shouldered bar Z, spring A′, sliding bar B′, and lever C′, applied as and for the purpose set forth.

139,304.—*Saw Sharpening and Setting Machine.*—EDWARD DUFFY, Oakland, Cal.

The segmental file is made adjustable and advances the saw one tooth at every revolution. The bed is capable of adjustment to accommodate itself to different-sized saws. The setting-arms are operated by cams and anticipate the filing operation.

Claim.—1. The file, consisting of the adjustable segments K K secured to the face-plate, and operating substantially as and for the purpose herein described.

2. In combination with the segments K K, the sliding plates M for minute adjustment, substantially as herein described.

3. The movable standards P with their guides T T, and the steadying-pin V for holding and guiding the saw, when made adjustable, substantially as and for the purpose above described.

4. The bed O, with its standards P and the guides T, when made adjustable to or from the file, for the purpose of accommodating the different-sized saws, and for changing the angle at which the file cuts the teeth, substantially as herein described.

5. The oscillating disk W with its adjustable setting-arms X, together with the cams *a* and C, for the purpose of setting the teeth, substantially as herein described.

139,305.—*Treadle-Movement.*—JOHN EVANS, Rosenbayn, N. J. Application filed February 21, 1873.

The slotted spring is so connected with the treadle and the crank pin and piston of a fly-wheel, that the latter must always move forward when turned.

Claim.—The spring F, slotted at the upper end and applied to treadle E and crank-pin C, as and for the purpose described.

139,306.—*Trunk-Catch.*—HENRY C. FABER, Utica, N. Y. Application filed April 19, 1873.

A catch intended to take the place of straps in a trunk, as a re-enforcement to the lock.

Claim.—An improved trunk-catch formed by the combination with each other of the top plate A provided with a tongue, *a'*, having a slot formed in it, the bottom plate B having a wide transverse slot formed in it, the hinged bar C c^1 c^2, the spring D, the latch E, and spring F, substantially as herein shown and described.

139,307.—*Hatchway.*—GEORGE FOLLETT and ADOLPHUS BRUMMEL, Brooklyn, N. Y. Application filed May 5, 1873.

Toothed racks are attached to the upper and under sides of the elevator-carriage, which engage with pinions operating upon racks attached to the horizontally-sliding hatches, so as to separate them upon the approach of the elevator, and close them behind it after its passage.

Claim.—The combination, with an elevator-carriage and the hatchway-doors, of one or more toothed wheels on opposite sides of the hatchway gearing with the sliding door (or doors) by one or more toothed racks, and a toothed rack or racks on each end of the elevator carriage engaging with said wheel or wheels in advance of the carriage and opening the doors therefor; also engaging said rack or racks after the elevator has passed, and closing the doors both in the up and down movements, substantially as specified.

139,308.—*Wrapper for Bottles.*—ALLAN E. FRANCIS, Ravenna, Ohio. Application filed February 7, 1873.

Claim.—The wrapper for bottles, constructed smaller at the top than at the bottom, all the sides being formed of one piece of paper, closed at the top by the adhesive top piece, and open at the bottom, with an adhesive part, D, for closing the bottom, substantially as and for the purpose herein set forth.

139,309.—*Harrow.*—JAMES FRANKLIN GAZLEY, Canyonville, Oregon. Application filed December 27, 1872.

An axletree supported upon wheels, has mounted upon it the driver's seat, and levers for lifting the harrow from the ground. The forward end of the harrow-frame is swiveled to the under side of the tongue, the rear end containing the harrow-teeth being free.

Claim.—1. The swiveled tongue A and harrow-head C, in combination with the main tongue B.

2. The swiveled tongue A and head C, in combination with the spring G, lever J, and stud H, substantially as described, and for the purposes set forth.

139,310.—*Beer-Cooler.*—JACOB GIMLICH, Pittsfield, Mass. Application filed April 19, 1873.

The ice-chamber has openings which permit the cold air to circulate around the cock. The drop water enters the lower tube, passing through the cask, escaping by the upper. The beer is forced up into the cooling-cask. Any compressed air or gas will rise into the air-chamber, from whence it can escape by a blow-off cock.

Claim.—The cask C, provided with three or more wooden tubes F, the flexible end pipes G, the inlet-pipe D, the outlet pipe or faucet E, the pipe H, and the air-chamber J, in combination with the ice-box A, and ice-chamber B, substantially as herein shown and described, and for the purpose set forth.

139,311.—*Bracelet.*—JOSEPH W. GRANT and CHARLES H. COOK, Providence, R. I. Application filed February 13, 1873.

The lower portion or rear strap is made of thinner, and may be of less valuable material than the front portion.

Claim.—As a new article of manufacture, a bracelet consisting of the box-front A and the rear strap-piece B, constructed and combined substantially as described, for the purpose set forth.

139,312.—*Envelope-Opener.*—GLOVER S. HASTINGS, Jr., Plainville, Conn., assignor to himself and EDWARD N. PIERCE, same place. Application filed November 20, 1872.

Part of the handle just opposite the point of the blade is grooved or cut away, so that the ordinary knife-blade when closed may be used to open envelopes.

Claim.—A new and improved article of manufacture, a pocket-knife, having the portion immediately opposite the point of one or more of its blades, grooved or cut away to a distance a little below said point, when said cut-away potion is arranged with an otherwise ordinary pocket-knife handle and its folding-blade, in the manner and for the purpose described.

139,313.—*Washing-Machine.*—ELIAS M. HODGSON, Stanhope, N. J. Application filed April 19, 1873.

The washing-machine is constructed with its tub in ordinary form, with the inside of the cover corrugated, which, by turning over, may be used for a wash-board. The beaters, one which is rigidly attached to the inside at an angle, by which the working-beater, by being suspended by a pivot near its upper end, is brought in contact by the operation of the connecting-levers. The beaters are formed with projecting faces, and with openings for the free circulation of water through it.

Claim.—The combination of the vibrating presser-board H with the fixed board G, each provided with a series of rows of holes, blocks, and grooves, as specified, and so arranged relatively that when the boards come together the said rows of blocks and grooves will be opposite each other, as set forth.

139,314.—*Apparatus for Separating Quicksilver from Amalgams.*—MARCUS B. HOWARD, Ellsworth, Nev. Application filed January 24, 1873.

Claim.—1. The upper and lower pipes C E connected at their outer ends with the vertical discharge-pipe D, when attached to the retort B, in the manner and for the purpose above described.

2. The upper and lower pipes C E and vertical discharge-pipe D, in combination with one or more water-jackets, G, substantially as and for the purpose above described.

139,315.—*Medical Compound or Ointment.*—JOHN G. HUCKS, San Francisco, Cal. Application filed March 28, 1873.

The destructive distillation of resins obtained from the different species of pine trees, of which is distilled his No 1 and No. 2 oils, and to which is added pure fresh lard, sifted hydrate of lime, distilled water, alcohol, fresh palm oil, Canadian balsam; grind and add the following ingredients: Alum, gum camphor, sulphur, concentrated potash.

Claim.—1. Crude or refined resin-oils as a base, in combination with healing drugs or medicines to form an ointment, substantially as set forth.

2. A healing ointment, composed of the ingredients above enumerated, mixed and compounded in the proportions specified.

139,316.—*Wardrobe-Bedstead.*—EDWARD HUNTER and DANIEL VAN SICKLE, Chicago, Ill. Application filed November 16, 1872.

The two hinged parts of the bedstead are locked together by means of a square tenon on the inside of one end of the swinging leg which enters into a square mortise on the side of one of the main parts, and by a dowel-pin on the inside of the other end of the leg, which enters into a corresponding hole in the other part of the bedstead.

Claim.—The clamping-screw *l*, foot-legs *i* provided with the tenon *j* and dowel-pin *m*, in combination with the two hinged and folding parts A and B of the bedstead, as and for the purpose specified.

139,317.—*Hub-Band for the Wheels of Vehicles.*—GEORGE H JOHNSON, Bridgeport, Conn. Application filed March 29, 1873.

The outer end of the band is covered by a wide collar of bright metal.

Claim.—A soft-metal trimming-band for wheel-hubs, constructed with the main part B, the collar C, and the flange F turned over so as to form a groove, G, as and for the purpose described.

139,318.—*Oil-Can.*—HENRY KELLER, Sauk Centre, Minn. Application filed April 5, 1873.

Claim.—A sheet-metal can, consisting of a horizontal cylinder, A, with legs B, filling-tube C, spout D, and handles arranged thereon, substantially as specified.

139,319.—*Coloring-Metal.*—JOSEPH KIETZ, West Meriden, Conn., assignor to himself and P. J. CLARK, same place.—Application filed April 5, 1873.

The iron is blackened and coated with a sizing, when pulverized black lead is applied and the surface brushed until polished; the lead is now lacquered and the iron heated.

Claim.—The process of coloring metal by sizing it, covering the size with pulverized black lead, polishing the lead, lacquering the polished lead surface, and heating the whole, all substantially as specified.

139,320.—*Cultivator.*—PHILIP LONG, Penn Township, near Junction Railroad Station, county of Lancaster, Penn., assignor of one half his right to JOHN M. PHILIPS, same place. Application filed January 25, 1873.

The side beams of the cultivator are pivoted at the front by a plate-hinge, which adds strength to the beam. The large number of teeth or shovels are narrow and pointed, set upon long standards for the purpose of deeply pulverizing the entire soil through which it passes.

Claim.—The above-described three-beam cultivator, with long standards passing through inserted bush-plates, and narrow pointed shovels; the frame adjustable as to width at the front by means of the peculiar hinge and plate, with the curved slotted-bar and set-screws at the rear, all combined and arranged substantially as set forth.

139,321.—*Gaiter.*—WILLIAM LOVE, McConnellsville, Ohio. Application filed April 1, 1873.

The elastic is inserted forward of the ankle-bone and to the rear of the median line of the front, to escape wear and give an easy fit, the leather front and rear receiving the principal wear.

Claim.—A shoe or gaiter, made substantially as described, with the elastic gores inserted forward of the ankle-bone.

139,322.—*Car-Axle Box.*—HENRY E. MARCHAND, Pittsburg, Penn. Application filed April 25, 1873.

The cover is curved, and slides in grooves in the ends of the box.

Claim.—1. The curved lid B of the journal-box, having one or more recesses or cavities, H, in combination with a supporting and locking pin, E, substantially as described, for the purpose specified.

2. The curved lid B of the journal-box, having the stop D, substantially as and for the purpose specified.

139,323.—*Breech-Loading Fire-Arm.*—AGOSTINO MARELLI, Milan, Italy, assignor of one-half his right to SANTE MERELLI, same place. Application filed February 27, 1873.

The breech and lock mechanism are attached to the guard-lever and move with it when thrown down to open the breech for loading; this movement also serving to cock the hammer so that the gun is ready for firing as soon as the lever is brought back to its position.

Claim.—1. The hammer Q provided with projection *r*, and pivoted to the guard-lever *a*, in combination with the stationary appendage *g'*, the parts being so arranged that the dropping of the guard-lever will cock the hammer, substantially as described.

2. The hammer Q pivoted to the guard-lever, and having a conical nose fitting a correspondingly-shaped opening in the recessed sliding breech-block R, the breech-block, the tooth *c* of the guard-lever, the stationary appendage *g'*, and extractor *i k l*, the parts being constructed and combined substantially in the manner described, so that the dropping of the guard-lever will simultaneously cock the hammer, open the breech, and extract the cartridge-shell.

3. The combination of the hammer Q, detent of trigger T, spiral spring S, and trigger guard-lever having a chamber formed in the upper portion of the same, the parts being constructed and arranged substantially as described.

4. The channel L in the butt end of the fire-arm to lead and collect the shells of the exhausted cartridges, as described and shown.

139,324.—*Metallic Gutter.*—THOMAS MCCLUNIE, Hartford, Conn. Application filed October 7, 1872.

Claim.—An improved manufacture of metal curb or gutter *a*, held in place or position in the ground by supports or rods *d* attached or secured to base-timber *e*, substantially as and for the purpose set forth.

139,325.—*Carriage-Spring.*—THOMAS MURGATROYD, Hiawatha, Kansas. Application filed February 15, 1873.

Brace springs are secured at each end to the main springs by means of buckles and pins.

Claim.—1. A horizontal brace-spring, D, applied to and between each pair of main springs, B B, for the purpose described.

2. The means for connecting the brace-springs D and the main springs B, consisting of the buckles *f h*, pins *g*, and bends *i*, as set forth.

3. The brace-spring D, cross piece E, vertical rods K, brace-rods *l*, and rests *e*, combined with springs B B, as and for the purpose specified.

139,326.—*Ribbon-Block.*—WILLIAM OBRIST, New York, N. Y. Application filed April 26, 1873.

The ribbon-block is a tube made of layers of paper glued together, and having wooden heads at the ends.

Claim.—The ribbon-block, consisting of paper tube A, produced as set forth, and wooden side-disks B, substantially as and for the purpose described.

139,327.—*Shoe-Nail.*—JOHN F. PAINE, Providence, R. I., assignor, by mesne assignments, of one-half his right to ROBERT MORROW, same place. Application filed September 28, 1872.

Nails cut in the usual way are case hardened by being packed in bone-dust, heated in a charcoal fire, and while still hot, immersed in cold water.

Claim.—As a new article of manufacture, carbonized shoe-nails, formed of iron and hardened or steelified, substantially as specified.

139,328.—*Loom for Weaving Piled Fabrics.*—EDWARD PICKFORD, New Brunswick, N. J. Application filed April 19, 1873.

From the side of the hook of the withdrawing-instrument a guard-piece is so extended that the head of the wire is prevented from shifting laterally out of position, and the necessity of making the head thicker than the wire is avoided. To secure the head still more perfectly the face of the hook and the corresponding face of the head are so beveled that the parts are locked together during the act of withdrawal.

Claim.—1. The combination of the guard E with the wire-puller C and its hook, D, substantially as specified.

2. The hook D provided with a beveled face, and the plates or wire-heads provided with beveled shoulders F, in combination with the said guard E, substantially as specified.

139,329.—*Child's Photograph Chair.*—MARK H. PRESCOTT, Jr., La Crosse, Wis. Application filed April 26, 1873.

A child's chair is provided with an adjustable head-rest and an adjustable waist-holder.

Claim.—The combination of an adjustable head-rest, A, with a chair having a waist-holder, I *j*, substantially as specified.

139,330.—*Cross Paddle Propeller-Fan for Ventilating Mines.*—DANIEL RISINGER, Mahanoy City, Pa. Application filed April 14, 1873.

A cylindrical casing supported in a horizontal position by any suitable means. Around the interior of this casing are secured in a diagonal or winding position a series of paddles, which terminate at the front end of the casing close up to a ring or flange projecting inward from the casing, and of the same width as said paddles. On the front end are secured a series of pockets, and at the rear end of the casing is inserted a ring with a series of wind scoops, which stand in about the same position as the outer stationary wind-paddles.

Claim.—The combination of the casing A, ring or flange C, paddles B B, air-pockets D D, scoops E E, and revolving paddles G G, all constructed and arranged substantially as and for the purposes herein set forth.

139,331.—*Machine for Finishing Horseshoe-Nails.*—ROBERT ROSS, Vergennes, Vt., assignor to NATIONAL HORSE-NAIL COMPANY, same place. Application filed January 6, 1873.

The nail-blank is fed along by means of a screw, which is adjustable longitudinally, and as the threads of the same gradually increase in width the nails become separated when in front of the dies. The first set of dies bevel the nail, and then the nail runs off the screw and is held against its end by suitable supports in front of two pairs of side-trimming dies, when two punches advance and drive the nail through said dies, which complete it.

Claim.—1. The hollow screws C E and nut D, combined with feed-screw A, swiveled therein, and held in a bearing, F, as and for the purpose described.

2. The feed-screw A, having the threads widened as they approach die G, as and for the purpose set forth.

3. The spring I, combined with die G and screw A, as described, to hold down the nail while being pointed by the hammer H.

4. The guard W', block W, head-block X, and inclined holder Y, combined with the screw, as described, to hold the nail in its proper position in front of dies K L.

5. The shaft, having wrist-pin working in block Q, that moves in curved slot P, in combination with slide O, as and for the purpose described.

6. The receiver *f*, combined with trimming-dies K L, as and for the purpose specified.

139,332.—*Machine for Swaging and Trimming the Points of Horseshoe Nails.*—ROBERT ROSS, Vergennes, Vt., assignor to NATIONAL HORSE-NAIL COMPANY, same place. Application filed July 27, 1872.

The blank nail is fed along, point downward, to the dies, by the threads of a rotating screw. The first pair of dies bevels the point as the blank moves along past them. Finally the blank drops into a pair of retaining-dies, which take hold upon its edges and support it in front of a pair of female trimming-dies until the male trimming-die advances and forces it through the female dies and from the machine.

Claim.—1. The combination of the feed-screw A, bar B, and the point-beveling dies C E, substantially as specified.

2. The combination, with the above, of the weighted lever G, substantially as specified.

3. The combination, with said feed-screw and bar, of the holding-dies I K, and point-finishing dies H L, substantially as specified.

4. The arrangement of the dies H' I K on a supporting-block pivoted to the machine, substantially as specified.

5. The driving-shaft S, arranged in its bearings and with the stock P to disconnect from the latter by sliding therefrom, as described, and the combination, with said shaft and one of its bearings, of the latch W and collar V, substantially as specified.

6. The feed-screw A and bar B, arranged to be adjusted relatively to the point-beveling dies, substantially as specified.

7. The combination of the guard M with the holding and point-finishing dies, substantially as specified.

139,333.—*Varnish or Bronze Coating for Articles of Plaster, Iron, Wood, &c.*—CHARLES ROTTER, East Birmingham, Pa. Application filed May 5, 1873.

Claim.—The bronze varnish obtained by combining mica silver or aurosit with collodion in the proportion described, in connection with the different colors of aniline, substantially as and for the purpose described.

139,334.—*Beer-Cask.*—MICHAEL SEITZ, Williamsburg, N. Y. Application filed April 26, 1873.

A rod having a head on one end and a nut on the other, and screw-threads of the same pitch and running in the same direction on both ends, passes longitudinally through the cask for strengthening the heads of the same.

Claim.—The combination of the rod D having a head upon one end, a nut upon the other end, and screw-threads of the same pitch and running in the same direction upon both ends, with the cross-bars C and heads B of the cask A B, substantially as herein shown and described, and for the purpose set forth.

139,335.—*Compound for Treating Iron, Steel, &c.*—WILLIAM A. SKINNER and JOHN E. GOODSON, Callao, Mo. Application filed May 5, 1873.

Pulverized borax, two parts; muriate of ammonia, two and one-half parts; nitrate of potash, one part; prussiate of iron, one-quarter of one pint, (one gill.)

Claim.—1. A compound, substantially as herein described, for use in the fire, but not in direct contact with the metal operated upon, as specified.

2. The combination of the ingredients described, or their equivalents, in substantially the proportions specified.

139,336.—*Reach for Bob-Sled.*—JOHN W. SMITH, Battle Creek, Mich. Application filed March 14, 1873.

The reach has pivoted to it a curved iron bar, through which the king-bolt is inserted. This is intended to allow the bobs to move independently, and relieves the bolster of strain.

Claim.—In a reach for bob-sleds, the bent arm A, plate D, straps I I, pin P, and arm or reach B, combined substantially as specified.

139,337.—*Mode of Fastening Diamonds into Blocks or Saw-Teeth.*—TERRENC SMITH, New York, N. Y., assignor of one-half his right to RICHARD NEVILLE, same place. Application filed April 12, 1873.

The diamonds are inserted, by means of screw-clamps, into holes drilled in the block, which is then brought to a cherry-heat. Part of the metal around the diamond is then filed away. The block is reheated and the metal hammered around the diamond, and filed to the proper shape.

Claim.—The manner and process of fastening diamonds into blocks, saw-teeth, or saw-blades, substantially as and for the purpose hereinbefore described.

139,338.—*Mortar Mixer and Grinder.*—EDWARD SPAULDING, Keene, N. H. Application filed April 12, 1873.

A series of rotary mixers suspended, in a mixing-vat, from a reciprocating carriage; a vat adjoining the mixing-vat, at one end of which is a grinding mechanism, into which lime and sand, after being mixed, are discharged.

Claim.—1. The combination of a series of reciprocating and revolving mixers, B, with a vat, as described.

2. The combination, with mixing-vat A and grinders G H, of the intermediate vat F, arranged to receive the mixing material and allow it to be fed therefrom to the grinders in the manner described.

3. The combination of rotary grinder H, pinion M, wheel O, crank-shaft N, connecting-rods Q, reciprocating carriage C, stationary racks D, wheels E, and mixers P, as described.

4. The adjustable stationary grinder H, presser J, adjusting-screw K, and rotary grinder, combined and arranged substantially as described.

139,339.—*Steam and Other Valves.*—E. FRANK SPAULDING, Cambridgeport, Mass. Application filed November 14, 1872.

A supplemental screw and nut is employed to cause one portion of the valve to move in advance of and close before the other.

Claim.—The above-described improved stop-valve, consisting of the case A, the stem B provided with the annular shoulder *e*, the screw *e'*, and nut *f*, arranged as described, the valve-plates or disks G G' furnished with ears *g* A, disposed thereon as shown, and the wedge *c*, formed and applied to the disks as specified, the whole being combined and arranged for conjoint action, as set forth.

139,340.—*Corn-Planter.*—DANIEL F. TAFT, New Bedford, Mass. Application filed January 25, 1873.

The machine is borne upon a pair of wheels. The seed-box is attached to the axletree upon the rear, and extends below. The furrow-openers with the covering-rollers, are articulated to the lower end of the seed-box, and the seed-valve is worked by a cam on the covering-wheel.

Claim.—The hinged spout E and wheel I, combined with piece J having seed-slide and bow-spring, as and for the purpose described.

139,341.—*Book-Rest.*—LIDA TARRING, Washington, D. C. Application filed May 19, 1873.

The rest is pivoted at its ends between two arms that may be pivoted on the top or sides of a desk.

Claim.—The combination of the arms *a*, thumb-screws *c*, and the book-holder B, as and for the purpose specified.

139,342.—*Washing-Machine.*—SYLVESTER J. TAYLOR, Rome, N. Y. Application filed February 5, 1873.

A washing-machine constructed with its upper rubber attached to the upright shaft by a braced spider, and pivoted to it, and rests upon a spiral spring surrounding it. To the face of the rubbers the arms or projections are attached by staples, by which they adjust to the different forms of clothes being washed.

Claim.—The rubbing-board *e* adjustably attached to standard *d*, and provided with rocking-rubbers *g g*, in combination with rocking-rubbers *b*, substantially as shown and described.

139,343.—*Last and Shoe Holder.*—BENJAMIN J. TAYMAN, Philadelphia, Pa. Application filed April 17, 1873.

The shoe is secured upon the last by a circular spur, which takes hold upon the lining at the heel, the spur being locked to prevent its turning while the shoe remains upon the last. The cutter-stock is provided with a knife and welt-trimmer, each made adjustable, and provided with suitable guides and gages for protecting the upper, and to limit the depth of cut.

Claim.—1. The last-holder A having pins C C and locking-bolt D, provided with a cross-pin, *f*, and lever *e*, in combination with the plate *e'* of the last B, having holes *d d* and *g* and inclines A A, substantially in the manner and for the purpose above described.

2. The combination of the circular spur F and the rod H with the heel of the last for securing the shoe thereon, the rod having inclines *i* which engage with inclines *i'* of the plate *e'*, substantially as described.

3. The combination and arrangement of the knife J, welt-trimmer K, gage L, guide M, guard N, levers P and Q, and stock I, substantially as and for the purpose set forth.

4. The combination of the adjustable collar *y*, stop *z*, rod V', and casting W having a socket, *p*, and pin *x*, substantially in the manner and for the purpose described.

139,344.—*Water-Wheel.*—SAMUEL T. TEACHOUT, Troy, N. Y., assignor to himself and JOEL C. PECK, same place. Application filed July 20, 1872.

The buckets of the wheel have a double curvature, and are attached to a flange, which is cast with them, and which terminates a little above the flaring part in an annular recess in the inner edge of the lower guide-rim to leave space for the water to enter the buckets.

Claim.—1. The guide rim M provided with annular recess L, arranged as and for the purpose described.

2. The combination of the said bucket E F and the flaring flanges D' K, substantially as specified.

139,345.—*Rotary Churn.*—GEORGE WALKER, Whitley's Point, Ill. Application filed February 8, 1873.

The dasher-shaft is vertical and carries vertical flanges, flat on their forward sides and inclined rearward; also, horizontal arms in series, so arranged that the uppermost arms move in advance to induce the fluid to pass between and beneath said arms.

Claim.—A dasher-shaft having vertical ribs and reversely-inclined arms, as and for the purpose described.

139,346.—*Automatic Vent-Opener for Air-Springs.*—JOHN WALTHER, Brooklyn, E. D., N. Y., assignor to CALVERT B. COTTRELL, Westerly, R. I. Application filed February 8, 1873.

A conical valve in an air-chamber, secured to the end of the hollow piston-rod of an air-spring cylinder, is automatically opened by either gravitation or suction of the piston, and closed by the air compressed to form the spring without intervention of other mechanism. To be used in printing-presses.

Claim.—The conical valve G decreasing from its upper working-face downwardly, in combination with a superposed seat having vent F, an air-chamber, D, and a hollow piston-rod, E, as and for the purpose described.

139,347.—*Liquid-Sealed Valve.*—LOUIS WINTERBAUER, New York, N. Y. Application filed February 8, 1873.

Upon drawing liquid from the cask, air enters bent tube, and, raising the weighted flap-valve, passes through liquid in the case, and, by flexible pipe and hollow plug, is conveyed to said cask.

Claim.—The case C *c'* having flap-valve and open tube D, the flexible pipe B, and the hollow plug A, combined and applied to a cask of fermented liquor, substantially as and for the purpose described.

139,348.—*Carriage-Spring.*—THOMAS H. WOOD, New York, N. Y., assignor to J. B. BREWSTER & CO., same place. Application filed January 6, 1873.

The body is supported by upwardly-bent springs suspended between the two side bars, which in turn are supported by downwardly-bent end springs which are secured to the rear axle and front bolster.

Claim.—A frame, consisting of the longitudinal side bars F F, downwardly-bowed end springs E E, and upwardly-bowed middle springs G G, constructed, arranged, and applied as and for the purpose described.

139,349.—*Wash-Boiler.*—JOSEPH ADAMS, Newark, assignor to himself and O. H. FRENIER, Granville, Ohio. Application filed May 14, 1873.

A wash-boiler, constructed with an oval or convex false bottom having attached to the supporting-flange side pipes or conductors on its inside, with openings at each end, over which is fitted a perforated cover with conducting perforated pipes for water and steam.

Claim.—1. A top convexed false bottom, B, constructed with subjacent channel-ways b^2 b^2, open on top to communicate with surface *b*, and open at each end to discharge water into the steam-generating chamber C, as shown and described.

2. The perforated clothes-shelf D, having the holes *d d*, combined, as described, with a false bottom, B, having the vertical pipes b^1 b^1, so that the former will fit over the latter, and be held in the manner set forth.

139,350.—*Cutter for Sewing-Machines.*—LESTER H. ALLEN, Farmington, N. H. Application filed May 17, 1873.

The knife cuts the material parallel with seam being sewed. The presser beside the needle-hole has a slot for the passage of the knife, and the former bears on and holds the material at all points about the portion being cut, thereby preventing it from displacement under the action of the knife.

Claim.—A presser-foot, provided with a needle-hole and an inclosed slot for the reception of a trimming-knife, in combination with a reciprocating knife attached to the needle-bar.

139,351.—*Printers' Quoin.*—CHAUNCEY W. AMES, New York, N. Y. Application filed August 9, 1872.

The plates are spread apart by wedges operated by right and left hand screws.

Claim.—The side plates A A', in combination with the wedges B B' and the right and left hand screw and nut D, substantially in the manner and for the purposes set forth.

139,352.—*Gas-Burner.*—BERNHARD ANDREAE, Frankfort-on-the-Main, Germany. Application filed January 8, 1873.

The illuminating gas is conducted through the interior pipe and oxygen through the exterior. A perforated adjustable cap covers the two pipes, serving to govern the size of the flame and the direction of the flow of oxygen.

Claim.—A burner or tip, F, provided with a flange, *e*, having incisions *e*, and attached to a central pipe, D, surrounded by a concentric pipe, E, in combination with a cap, J, fitted over the external pipe E, substantially in the manner and for the purpose hereinbefore set forth.

139,353.—*Eye-Glass.*—ARTHUR D. ANSELL, Hartford, Conn., assignor to LAZARUS, MOSES & CO., New York, N. Y. Application filed February 17, 1872.

The nose piece or bridge is connected with the glass or sight frames by a recurved spring on either side, attached by its extremity so as to leave the side clasps for the nose separated from the eye-glasses.

Claim.—The re-enforcing suspension-springs B B, attached to glass-frames at one end and to bow-spring at the other, as and for the purpose described.

139,354.—*Machine for Molding Boot and Shoe Bottoms.*—STEPHEN W. BALDWIN, Yonkers, N. Y. Application filed August 8, 1871.

Claim.—1. A die-block and an edge-forming mold, operating simultaneously to compress and compact together between them the layers of the blank, and to form the edges thereof to shape, by combined vertical and lateral pressure, substantially as described.

2. An adjustable edge-forming mold combined with a die-block to compress and compact together the layers of the sole-blank, and to form the edges thereof to shape, by combined vertical and lateral pressure, substantially as described.

3. An edge and sole forming mold composed of parts adapted to move to and from each other laterally, for the purpose of compressing the sole-blank laterally and holding it in place while subjected to vertical pressure, substantially as described.

4. A yielding die-block in combination with an adjustable edge-forming mold, substantially as described.

5. The piercers or awls combined with a yielding die-block and an adjustable edge-forming mold, substantially as described.

6. The adjustable incline in combination with the adjustable edge-forming mold, substantially as described.

139,355.—*Thrashing-Machine.*—ISAAC T. BARTON, Union City, Mich. Application filed May 10, 1873.

The blast created by the rapid revolutions of the beater-fans more thoroughly separates the unthrashed grain from the straw.

Claim.—1. The series of fans F, arranged as herein described, to conduct the straw from the thrashing-cylinder, and constructed with flat radial wings to produce a current of air beneath the straw to assist in separating the grain, as explained.

2. The combination of the beater-fans F, constructed, as described, with the thrashing-cylinder B, grain-carrier L, and winnowing apparatus D E S, all arranged to operate substantially as and for the purposes set forth.

139,356.—*Puddler's Ball Roller.*—ROYAL M. BASSETT, Birmingham, Conn. Application filed March 21, 1873.

Two segmental lugs on the lower dished surface of the roll interlock with two corresponding lugs on the surface of the plate, and two segmental lugs on the shaft interlock with two similar lugs on the plate projecting from the wall of the hole.

Claim.—The combination of the shaft, roll, and plate by means of the flanges, lugs, and recesses described, and in the manner shown.

139,357.—*Piston-Valve for Steam-Engine.*—ALEXANDER BAUMANN, London, England. Application filed February 14, 1873.

The steam is cut off from the main cylinder, before the end of stroke, by detached leading valves, one at each end of the main cylinder, and an intermediate one, all moved by the pressure of the steam that fills the main cylinder at or near the completion of each stroke. The piston-valves cut off the exhaust of the main cylinder before the end of each stroke, and form a cushion which checks the momentum of the main piston. The outer piston-disks are a little smaller in diameter than the middle ones, to allow the steam to operate them.

Claim.—1. The main cylinder G, provided with exhaust ports b^3 c^3 arranged therein at a short distance from each end, as described, so that the piston will cut off the exhaust-steam before reaching the end of its throw, and thereby form a cushion for itself at each end of the cylinder.

2. The automatic valve mechanism, consisting of the valves A B C constructed and arranged in cylinders D E F, connected with one another and with the main cylinder G, as and for the purpose set forth.

139,358.—*Machine for Rolling Blooms.*—GEORGE W. BILLINGS, Chicago, Ill. Application filed June 29, 1872.

A set of three-high rolls, each divided by collars into four spaces, the middle roll cogged in all of its spaces, and the top and bottom roll cogged in one space each.

Claim.—The combination of the three welding-rollers *d*, *e*, and *f*, each of which is divided by bosses *g* into spaces whereof the cogged spaces of the upper roller *d* are the same in diameter as the respective corresponding or opposite spaces of the middle roller *e*, and the cogged spaces of the lower roller *f* are the same in diameter as the respective corresponding cogged spaces of the middle roller *e*, so that the pile can be passed back and forth between the rollers and thoroughly welded without material elongation of the pile, substantially as set forth.

139,359.—*Process of Manufacturing Rolled Iron.*—GEORGE W. BILLINGS, Chicago, Ill. Application filed August 12, 1872.

To dispense with the formation of muck-bars, and the cutting, piling, and heating of the same, a set of three-high cogged-rolls are used, which takes the bloom as it emerges from the squeezers and subjects it to an operation of kneading, that, without materially elongating it, expels the cinders and fits it for immediate conversion into merchant or other bar.

Claim.—The described process of working puddled or scrap-billets into merchant bar-iron without cutting and repiling the iron, substantially as set forth.

139,360.—*Rotary Printing-Press.*—SAMUEL H. BINGHAM, Philadelphia, Pa., assignor to himself, EDWARD B BINGHAM, of NEWARK, N. J., GEORGE W. VAN ALLEN, New York City, and WILLIAM N. STONE, Philadelphia, Pa. Application filed January 30, 1873.

Claim.—The combination with each other of two lithographic or chemically-prepared printing-cylinders A B, which are so arranged in one frame as to constitute pressure-cylinders for each other, for printing with their smooth and unengraved surfaces different or like matter upon opposite sides of one or more sheets, substantially as specified.

139,361.—*Manufacture of Joint for Bracelets.*—JAMES B. BLACK, Providence, R. I., assignor to A. O. BAKER, same place. Application filed March 29, 1873.

A strip is rolled out and cut into pieces of the proper length for a joint or hinge. To the groove in the center of one piece is soldered a single section of tubing, and to another piece a section at each end thereof, as shown in Fig. 4. The two pieces are then put together by a rivet running through the sections.

Claim.—The method herein described of forming a joint for bracelets, consisting in the rolling of metal into suitable strips of the form shown, and the subsequent cutting and soldering thereto sections of tubing, in the manner substantially as specified.

139,362.—*Dumping-Car.*—THEODOR BOOTSMANN, New Brighton, N. Y. Application filed March 28, 1873.

The truck is constructed with a double set of longitudinal side timbers, between which are secured the axle-boxes. Fenders are secured to these timbers and the bolster. The body is supported by rockers, which have their bearings upon the bolster.

Claim.—1. The combination of longitudinal timbers *a a*, having cross-timbers *b* clamped between them, with a central longitudinal beam, *g*, fenders *i*, and sleepers *f*, connected together by screw-bolts A, substantially as set forth.

2. The lever-catches *t*, mounted on rods *u*, which extend transversely under the bottom of the box C, and carry stops *v*, in combination with chains *r* and with the swinging doors *p* of a box, C, supported by rockers *q*, substantially as set forth.

139,363.—*Buckle for Hanging Reciprocating Saws.*—HENRY W. BROWN, Warren, Pa. Application filed November 21, 1870.

The lower saw-buckle is pivoted to the pitman-connections in such a manner as to afford a ready means of ranging the saw.

Claim.—1. A muley-saw buckle or connection composed of the following parts, namely, a stirrup provided with a bearing, B B', adapted to be mounted on a sliding cross-head or on a pitman, and to vibrate thereon, and a clamp in which the saw is secured, this clamp being attached to the stirrup by a pivotal connection, as shown, or its equivalent, whereby the clamp can be adjusted upon the stirrup for ranging the saw, substantially as described.

2. In combination with the stirrup A and pivoted clamp D, in which the saw is secured, the screw H, or its equivalent, for ranging the saw, substantially as described.

139,364.—*Carriage-Protector.*—GEORGE B. BROWN, Newburg, N. Y., assignor to himself and LEWIS J. BAZZONI, same place. Application filed April 5, 1873.

To the under side of the metallic plate is attached a rubber pad intended to scrape the mud from the wheel. The metallic plate will then deflect the mud so that it may not be thrown upon the carriage.

Claim.—The combination of the plate E, rubber F, and the curved arm G, having a bifurcated piece, H, which is bolted to the end of spring, as and for the purpose set forth.

139,365.—*Printing-Type.*—DAVID W. BRUCE, New York, N. Y. Application filed March 17, 1873.

The figures are cast upon a block equal to two-thirds of an "em." The line separating the numerator from the denominator of fractions is omitted to enable the face of the figures to be increased in size.

Claim.—1. Figures and fractions in printing-type cast upon a block equal to two-thirds the width of the body of the "em" or standard type.

2. Fractional figures in printing-type, constructed without a dividing-line without regard to width of body.

139,366.—*Shoulder-Brace.*—NELSON C. BURNAP, Argusville, N. Y. Application filed January 2, 1873.

Claim.—A shoulder-brace, in which are combined a pad, A, provided at its opposite ends with tubes D, inclosing spiral or other springs E, and straps F with their ends G passing through said springs and retained therein, substantially as and for the purpose herein set forth.

139,367.—*Corn-Harvester.*—JAMES CARROTHERS and WILLIAMSON CARROTHERS, Newton, Iowa. Application filed April 11, 1873.

A series of gathering fingers or knives, with washers interposed to preserve uniformity in the spaces, are vibrated vertically by eccentrics placed on the pivoting-shaft, so disposed that adjacent fingers simultaneously move in opposite directions.

Claim.—1. The combination of the knife A, eccentric B placed on the shaft C, and the washers D D, all constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the knives A A, operated by eccentrics

B B, and provided with slots *b b*, and the shaft *d* passing through said slots, as and for the purposes herein set forth.

139,368.—*Sewing-Machine.*—RUFUS CHANDLER, New York, N. Y. Application filed April 1, 1873.

A screw with a cam-projection at one end is secured to the lower shaft. A plate whose normal position is against the gage, it being retained there by a spiral spring, has a projecting rib that enters the screw-thread, and, as the screw is rotated, moves the plate back until the plate comes over the cam, when it is elevated, and with it a rod which is connected with the presser-operating arm. In this way the presser is raised after any desired number of stitches.

Claim.—1. The screw D, plate C, cam G, and spring K, when combined and arranged as and for the purpose set forth.

2. The screw D, cam G, plate C, spring K, rod B, and arm A, when combined and arranged as and for the purpose set forth.

3. The gage F, spring K, screw D, plate C, and cam G, with the thumb-screw E and graduated scale upon the bed-plate of the machine, when combined as and for the purpose set forth.

139,369.—*Turpentine-Tool.*—JOHN G. COBB, Shoe Heel, N. C. Application filed December 12, 1872.

A curved thin blade is attached to a bifurcated shank, and by that secured to a pole or handle.

Claim.—The described double-edged reversible turpentine-scraper, provided with a handle arranged in a plane nearly parallel to that of the blade, as set forth.

139,370.—*Feeder for Quartz-Mills.*—THOMAS A. COCHRANE, Jamestown, Cal. Application filed June 10, 1872.

A hopper is mounted above an endless apron, which moves forward automatically by means of a pawl working in a ratchet, and operated by a projection upon the tappet, so that, upon each drop of the stamp, the pawl is urged forward, and motion thereby imparted to the apron.

Claim.—The hopper A, in combination with the horizontal endless belt or band F, operated automatically by means of the ratchet *g*, adjustable spring-bar H, and tappet I, substantially as and for the purpose above described.

139,371.—*Hobby-Horse Swing.*—JESSE A. CRANDALL, Brooklyn, N. Y. Application filed March 24, 1873.

The middle portion of the horse is fastened securely to the base, and has a cross-bar firmly attached thereto. The cradle is loosely hung to the hoofs of the movable fore and hind quarters, which are in turn pivoted to the ends of said cross-bar.

Claim.—1. The carriage D, connected with the vibrating parts B C of the horses below, and respectively in front and back of the points of suspension of said carriage, whereby it is made to move in a reverse direction to the upper portions of the parts B C, substantially as and for the purpose described.

2. The combination of the central uprights *a a* with the vibrating portions B and C, seat or cradle D, and brace *d*, all arranged to operate in the manner indicated.

139,372.—*Druggist's Scale.*—ALBERT CURANI and CHARLES REINHARDT, Brooklyn, N. Y. Application filed March 29, 1873.

The scale-beam is supported by a rod or stem fitting within a tubular standard, and a set-screw, passing through a slot in the outer tube into the sliding rod, forms a handle for raising and holding the same when the scales are to be used.

Claim.—The screw D and head or nut *d*, in combination with the fulcrum-rod B and longitudinal slot *a'* of the standard A, for the purpose set forth, arranged and constructed substantially as described.

139,373.—*Shears for Cutting Paper.*—WALTER P. DEANE, Canton, Mass. Application filed March 24, 1873.

The socket of the shear is centered on its bearing-box by means of adjustable set-screws.

Claim.—The stationary stud-pin *f*, in combination with the quill *g* and sleeve *k* and set-screws *l*, substantially as described.

139,374.—*Tube-Expander.*—COLLINS W. DEANE, Philadelphia, Pa. Application filed March 11, 1873.

The expander is formed in two parts, one part carrying the projections for forming the rib against the inside of the tube-sheet, while the other portion, having a curved projection, binds the end of the tube. The instrument is turned to different positions when operated.

Claim.—1. A two-part tube-swage, on one portion of which ribs *x x* are combined with a curved projection, *n*, as and for the purpose herein set forth.

2. The within-described tool, consisting of the portion A of the swage with its ribs *x x*, the portion A' with its projections *m* and *y*, and the wedge B, all combined for joint action, as and for the purpose herein set forth.

139,375.—*Machine for Rolling Tobacco.*—DAVID W. DE FOREST, Petersburg, Va., assignor of one-half his right to WELLINGTON M. LEWIS, same place. Application filed October 19, 1872.

One of the rollers is carried in a hinged frame, and, when closed against the other roller, the filler is held in a fold of the endless apron underneath. Another roller beneath imparts motion to the apron, tightened by a tension-roller, and to the inclosed bunch of tobacco, which is thus rolled and pressed into shape. The wrapper is then inserted, the motion of the apron carrying it around the pressed bunch. Sponges are arranged to moisten and clean the apron.

Claim.—1. The adjustable tension-roller E, sliding blocks D D, arms *e e*, screw-rods F F, and connecting gear-rod G, in combination with the apron J, substantially as set forth.

2. A guard, consisting of a plate arranged across the apron and attached to the arms of the hinged or pivoted frame B, substantially as and for the purpose set forth.

3. The combination of sponges K with the endless apron J, substantially as and for the purpose set forth.

4. The hinged frame B, roller with pulley *b*, roller C with pulleys *a' a*, standards A A, roller with pulley *c*, apron J, arms *e e*, sliding blocks D D, tension-roller E, screw-rods F F, and lever-rod G, all constructed and combined substantially in the manner and for the purposes as set forth.

139,376.—*Electric Railway Signal.*—JEAN D. DIGNEY, THEODORE DIGNEY, HENRY LARTIGUE, and HENRY FOREST, Paris, France. Application filed March 20, 1873.

Signal turned in one direction closes one break in an electric circuit, another break in which is completed through a plate fixed near or between the rails and a wire-brush carried by locomotive. This circuit passes a magnet controlling a whistle, so that the signal being turned the whistle is sounded calling engineer's attention thereto.

Claim.—1. The combination, with the movable contact, of the automatic steam-whistle alarm apparatus, constructed and arranged as herein shown and described, said parts being carried by the locomotive, and designed to operate in connection with a fixed contact on the track or road over which the locomotive runs, under the conditions and in the manner herein shown and described.

2. The combination of the electro-magnet, the two levers, their connecting-rod and spring, and the steam-admission valve, the same being arranged together and operated substantially in the manner and for the purposes shown and set forth.

139,377.—*Coffee-Roaster.*—GEORGE W. DODSON, Mitchell, Ind. Application filed March 14, 1873.

Improvement on his patent of April 23, 1872. Two elliptical cases, one inside the other, each with a suitable door or opening in the upper side. The body of the inner case is made of wire-gauze, the ends of flat pieces of metal, and inside are broad inclined wings, which act as stirrers when the inner case is revolved.

Claim.—The combination of the elliptical-shaped cases A A', the shaft D, and the interior screen-case E, provided with door G and inclined wings H H, all constructed substantially as set forth.

139,378.—*Folding-Guide for Sewing-Machines.*—JOHN E. EARLE, New Haven, Conn., assignor to the ELM CITY COMPANY, same place. Application filed March 7, 1873.

The strip of material to be used for trimming is passed through the flat guide-tube; then between the rollers, one of which is flanged and acts to fold the edges of the material at right angles, and then the material passes through the conductor, which acts to fold the edges under and against the main portion of the strip.

Claim.—1. A folding-guide for sewing-machines, consisting of the flanged roll A, and a rolling or other surface, between which and the said roll, by means of the flanges *a*, the edge or edges of the fabric passing between are turned at right angles to the surface to define the width of the finished fold, and the guide-tube C, for the purpose of properly presenting the material to the roll, substantially as set forth.

2. In combination with the flanged roll A, and a rolling or other surface, between which and the said roll the fabric passes, as before described, the conductor D, constructed and arranged relatively to the said roll, substantially as set forth.

139,379.—*Mechanical Movement.*—RUDOLF EICKEMEYER, Yonkers, N. Y. Application filed May 13, 1873.

A radially-vibrating crank-arm is hinged at the end of a rotating shaft, on an axis which is set at right angles to the axial line of the shaft, and it is connected with a longitudinally-reciprocating rod by means of a universal joint, whereby the continuous rotation of the shaft will impart to the rod a smooth and easy reciprocating movement.

Claim.—1. The radially-vibrating crank-arm D, pivoted or hinged to the crank-shaft, substantially as described.

2. The combination, substantially as described, of a crank-shaft, a radially-vibrating crank-arm, a longitudinally-reciprocating rod, and a universal-joint connection, whereby the longitudinal movement of the rod, or the rotation of the shaft, will respectively rotate the shaft, or impart to the rod a longitudinally-reciprocating movement, as and for the purposes specified.

3. The combination of a crank-shaft and a radially-vibrating crank-arm with the adjustable collars fitted to the crank-shaft, in close relation to the bearing, substantially as described, whereby the end strain on the shaft may be borne by the collar, and the wear thereon be compensated, as set forth.

4. The combination of the hinged crank-arm, the ball-headed wrist-pin and its socket, substantially as described.

5. The combination of the vibrating crank-arm with the longitudinally-adjustable hinge-pin, substantially as described.

6. The combination of the bow-shaped crank-arm, the hinge-pin, the sleeve-nut or hollow bolt *f*, substantially as described, whereby the parts may be kept in proper relation with each other and with the crank-head without undue compression on the sides of the crank-arm, as set forth.

7. The socket-connection, constructed in two sections, in combination with the main bolt, hollow bolt, and jam-nut, substantially as described.

8. The combination of the crank-shaft, the crank-arm, and the reciprocating rod, with a socket-connection, which is keyed or fastened to the rod, substantially as described, whereby the rod may be partially rotated during the longitudinal movement, as set forth.

9. The combination of the crank-shaft, the crank-arm, and the reciprocating rod, with a socket-connection, which is loosely mounted on the rod and free to partially rotate thereon, substantially as described, whereby the rod, while being moved longitudinally cannot be rotated by the connection, as set forth.

139,380.—*Neck-Yoke.*—PETER EPLER, Collumsville, assignor of one-half his right to JOHN ZERBE, Limestone township, Pa. Application filed April 12, 1873.

By moving the free end of the spring D from the yoke the martingale or hold-back strap may be placed on the spring, which being released returns to its place and effectually locks the strap upon the neck-yoke.

Claim.—The neck-yoke A having the springs D and *d*, substantially as and for the purpose specified.

139,381.—*Clevis Bar and Hook.*—ROBERT GIBBS, Spring Hill, Mo. Application filed February 19, 1873.

Claim.—1. A clevis-bar having front piece E' with the hook *h*, combined on a plow-beam with the yoke-nut C and screw-rod D, as and for the purpose described.

2. A staple, F, having shank *f* with two reversed hooks at the end and a single pin, *f'*, combined, as and for the purpose set forth.

3 A hook having the shank *f* swiveled in front piece B' of clevis-bar, and combined rigidly with a laterally-adjustable plate, G, as and for the purpose specified.

139,382.—*Machine for Manufacture of Boot and Shoe Heel Blanks.*—CHARLES W. GILDDEN, Lynn, assignor to JAMES W. BROOKS, trustee, Boston, Mass. Application filed May 6, 1873.

A series of molds varying in size are cut in the face of a horizontal rotating wheel. The material from which the heel is to be made is placed in the molds, solidified by a plunger, and as the compressed material is forced down below the lower surface of the mold sufficiently for a lift, a cutter-blade sliding in the plane of the bottom of the wheel is advanced, slicing off a lift-forming portion. When a lift has been cut from each mold, as above described, the several lifts are automatically collected and nails forced through them by the nailing mechanism.

Claim.—1. The die-wheel *d*, follower *i*, piston *p*, plunger *k*, and nail-block *u*, combined and operating substantially as shown and described.

2. In combination with the plunger *k*, the dies *e*, block *u*, and cutter *v*, operating substantially as described.

3. The combination of the plunger *k*, nail-block *u*, cutter *v*, driver-block *h*, and drivers *z*, operating to cut, assemble, and nail the successive lifts, substantially as described.

4. The improved method of making boot and shoe heels, consisting in forming material for the various lifts in successive dies, cutting the respective lifts in succession, and assembling and uniting them by means substantially as described.

139,383.—*Plasterers' Float.*—LOUIS A. GOODELL, New Haven, Conn., assignor to himself and ANDREW J. RAMSDELL, same place. Application filed April 3, 1873.

Claim.—The herein-described improvement in plasterers' floats, consisting of the posts B C having each a hook-shaped foot, and the handle D attached to the said posts, so that by turning the handle the posts may be drawn together or forced from each other, substantially as set forth.

139,384.—*Shuttle-Box Mechanism for Looms.*—ROBERT B. GOODYEAR, Wilmington, Del., assignor of one-half his right to BARTON H. JENKS, Philadelphia, Pa. Application filed December 2, 1872.

To reduce the extent of the box movement, under certain circumstances, in a loom provided with rotating shuttle boxes, the number of steps or gradations on the pattern-wheel, which controls the box-motion, exceeds by one the number of compartments in the series of boxes, and the steps on the actuating levers are made to correspond in number with those on the pattern-wheel. A vertical spring-arm, pivoted on the axis of the lay, is so arranged that, on the back movement of the lay, two of the division-plates of the box series strike curved projections on the upper end of the arm, by which means the boxes are adjusted and held in position.

Claim.—1. A loom in which a rotating shuttle-box is operated by a pattern-wheel or chain through the medium of levers K K' and a chain, and in which there is one more step upon the chain and on each lever than there are compartments in the box, all substantially as and for the purpose described.

2 The combination of a rotating shuttle-box with the adjusting and retaining arm N, arranged and operating substantially as described.

139,385.—*Boots.*—ISAAC HALL, Boston, Mass., assignor to himself and DAMON, THOMAS & LEWIS, same place. Application filed April 16, 1873.

Improvement on patent No. 55,799. The improvement consists in applying a stay-piece on the inside of a boot or shoe made under said patent. The stay is secured between the inner and outer soles and passes over and above the counter, and thus covers and strengthens the back seam.

Claim.—1. In combination with the boot having a foot and leg piece, *c*, and a counter-piece, *d*, cut and united substantially as shown, the protector *f*, extending from the soles *a a*, across the seam *h*, and united to the soles, to the counter, and to the leg and foot-piece, substantially as shown and described.

2. The protector-piece *f*, applied as described, and made as the inwardly-folding flap, to be used in connection with the strap *i*, or equivalent fastening device.

139,386.—*Middlings-Purifier.*—CHARLES M. HARDENBERGH, AMOS L. MINER, and WILLIAM J. FENDER, Minneapolis, Minn. Application filed May 10, 1873.

Middlings fed into the hopper fall upon a revolving cone, from which they are scattered in every direction in the air-cylinder by a current of air that is forced through the tube C'', the light particles of bran, &c., being drawn off by an exhaust-fan, the middlings passing onto a shaker, from which any particles of bran, &c., still adhering to them will be separated and drawn off by the same exhaust-fan, while the middlings will pass through the shaker.

Claim.—1. In a middlings-purifier, the air-cylinder B, having the hopper-shaped bottom, composed of annular reverse conical rings *b*, having air-spaces *b'* between them, in the manner substantially as and for the purposes described.

2. The revolving air-tube C'', having stirrers *c c c*, and conical base *u*, in combination with the receiving-hopper C, having the cylindrical base surrounded by a feed-sleeve, I, to regulate the amount of middlings fed into the machine, substantially as and for the purposes described.

3. The receiving-hopper C, having the cylindrical base and feed-sleeve I, and the air-tube C'' revolving therein when suspended within the exhaust-cylinder B, in the manner substantially as and for the purpose described.

4. In a middlings-purifier, the frame E having a horizontal or nearly horizontal reciprocating movement, and the bolt-cloth frame E within and reciprocating therewith, and having a perpendicular jarring movement independently from frame E, substantially as and for the purpose described.

5. The combination of the revolving-cams *g'''*, pivoted levers F and F', adjustable lugs H, and springs *h'*, with the bolt-cloth frame E', and jar-plates *f⁵*, in the manner substantially as and for the purpose described.

6. In a middlings-purifier, the arrangement of an air-forcing fan, *j*, a revolving air-tube, C'', a receiving-hopper, C, within an air-cylinder, B, having a hopper-shaped bottom of annular angular rings with air-spaces between them, the bolt-cloth frame E' having a reciprocating and a sudden vertical rising-and-falling motion with an exhaust-fan, *k*, constructed to operate in the manner substantially as herein described.

7. In a middlings-purifier, the air-forcing fan *j* and the exhaust-fan *k*, when arranged upon the same shaft J', in the manner and for the purpose substantially as described.

139,387.—*Machine for Dressing Hoops.*—SILAS L. HEYWOOD, Minneapolis, Minn. Application filed February 20, 1873.

The devices which guide and steady the hook are attached to oscillating bars or levers, by which means they readily adapt themselves to the bends and inequalities of its surface.

Claim.—1. The combination of the feed-rollers E and E' with the vibrating arms F and F', in which they are sustained and revolve, together with the actuating means for revolving them, and so that they can freely vibrate in either direction laterally, or be separated from each other, substantially as shown.

2. The swinging-arm H having the upright presser-foot *h* and springs *h⁴* and *h⁵*, in combination with the guide-way *h'* having stop *h''*, in the manner substantially as described and shown.

3. The sliding gage I having the upright gage-piece *i*, in combination with the cutter-head B, constructed to operate in the manner and for the purpose substantially as described.

4. The combination of the sliding bar I, sliding gage *i* with the cutter-head B, when operating substantially in the manner and for the purpose described.

5. The combination of the adjustable notched stop-plate *l*, lever L with the sliding gage I and bar I', in the manner substantially as and for the purposes described.

6. The combination of the pivoted arm G and yoke-plate *g''*, with the feed-roller E' and slotted plate *f'*, all constructed to operate in the manner substantially as described.

139,388.—*Machine for Cutting and Punching Leather Straps.*—JOHN F. HOLLISTER, Plano, Ill. Application filed April 14, 1873.

Two disks or segments are so pivoted relative to each other that one forms an opposing face for the action of the puncher as the strap is fed between them. A reciprocating knife, in combination with the pivoted segments, is operated to cut the strap, when punched, of a uniform length; also to skive the ends when required to adapt them for attachment to another thickness of leather, as for bucket-straps, &c.

Claim.—1. The pivoted segments B C, provided one with the holding jaw or clamp K, and the other with the punches *a*, combined and operating substantially as and for the purpose described.

2. The segments B C, in combination with the straps *b c*, applied and operating substantially as described.

3. The combination of the knife G with the punching-segments B C, for cutting the straps of uniform lengths, as described.

4. The skiving-knife D, in combination with the eccentric *d²* on the segment or disk C, substantially as and for the purpose set forth.

5. The dog or clamp K, in combination with the segment C, for holding the strap to the segment, operating as described.

6. The tension-spring L, operating in combination with the strap-segment C, for holding the strap, as described.

139,389.—*Settee.*—JULIUS HOLZER and EDWARD R. HOLZER, Philadelphia, Pa. Application filed August 27, 1872.

The seat is weighted or balanced so as to assume an upright position when not occupied, and is pivoted on its under side to extension supports on the end frames. These end frames are

formed with recesses to permit the tilting of the seat, said recesses being curved at the back side and straight at the front side.

Claim.—The combination of the seat, weighted or balanced, as described, with the sides, having the extension supports and recesses, as set forth.

139,390.—*Ore-Washer.*—WILLIAM HOOPER, Ticonderoga, N. Y. Application filed January 21, 1873.

The buddle is arranged within a suitable frame, and is provided with gudgeons, upon which it may be revolved, and has arranged beneath a series of partitions for separating the contents of the buddle when the same is dumped. A mixing-tub, oscillating-feeder, and distributing-apron is also arranged for receiving the ore from the stamp and transmitting it to the buddle.

Claim.—1. A dumping-buddle, constructed substantially as herein shown and described.

2. The combination of a mixing-tub, an oscillating feeder and apron, with a dumping-buddle, substantially as set forth.

139,391.—*Toy Pistol.*—OTIS W. HOBE, Chicopee Falls, Mass. Application filed March 19, 1873.

Claim.—The cylinder A provided with the spring *e*, and with the piston *m* and spring *k* operating therein, in combination with the trigger *b* provided with the point *s* and its operating-spring, and the hinged barrel B having the projection *c* thereon, and provided with the sliding rod *f'*, all constructed and operating substantially as described.

139,392.—*Plate-Printing Press.*—GEORGE C. HOWARD and AMANDA J. DAINTY, (administratrix of estate of JOHN DAINTY, deceased,) Philadelphia, Pa., assignors to GEORGE C. HOWARD. Application filed November 23, 1872.

A series of plates, resting on an annular rack, which is driven by a pinion, traverse in annular ways on a bed, and their movement is arrested at intervals for applying paper, for inking, and for making the impression, by a pin on each plate successively striking a rod, and thus releasing a bar carrying a belt-shifter, which then, by a spring, throws the belt from the driving pulley upon a loose pulley. The belt is shifted back by means of a treadle attached to the bar. After inking the engraved plate dry paper is placed upon it, and on the paper is placed a damp pad. A quadrangular frame is then placed over the pad in order to depress its edges and hold it in place.

Claim.—1. A printing-press in which a number of plates are caused to traverse a continuous path and beneath a platen, or its equivalent, substantially as described.

2. The combination, with the above, of the belt-shifter, lever *q*, rod *t* and its stud *u*, or equivalent mechanism, whereby the traversing plates are rendered the means of arresting their own motion.

3. The combination of a stationary bed, D, having annular, or partly annular and partly straight, ways and grooves, with a revolving rack, A, and plates B, adapted to the grooves and to the rack, as herein set forth.

4. The process of printing from an engraved plate by the application thereto of a sheet of dry paper, and above the latter a sheet of absorbent material from which moisture is transmitted to the paper on the application of pressure, as set forth.

139,393.—*Stereotype-Plate Holder.*—CHARLES HURST, Philadelphia, Pa. Application filed May 2, 1873.

A stereotype-plate holder made of wood covered with a metallic casing.

Claim.—1. The block, composed of the cast metal casing D and the wooden core A B C, constructed substantially as and for the purpose described.

2. The sleeves I I, in combination with the block composed of the metal D and wood A B C, substantially as described and set forth.

139,394.—*Street-Lamp.*—CHARLES F. JACOBSEN and ALOIS BURGER, New York, N. Y., said BURGER assignor to said JACOBSEN. Application filed March 29, 1873.

The conical globe, made in sections or in one piece, is held between two plates, to one of which the ventilating top is attached, and the other serving to attach the lantern to the post. When the globe is made of a single piece the rods are so bent that by taking off the top plate they may be turned in parallel directions, thus allowing the globe to be removed.

Claim.—1. A street lamp consisting of an inverted truncated cone of glass, either solid or formed in pieces, as set forth, surmounted by a dome-shaped top, having a ventilating-chimney, the several parts being supported and held in place by rings and rods formed and connected in the manner described and represented.

2. In a street-lamp a frame for supporting a truncated cone of glass formed in one piece, said frame consisting of upper and lower metallic rings united by rods placed inside of the glass cone, and bent as described, so that when turned in the manner stated they will allow of the ready removal of the cone.

139,395.—*Harvester-Dropper.*—NILS JOHNSON, Newburg, Minn. Application filed April 11, 1873.

A lever, connected at one end with a hinged dropping platform, has its other end bearing against the periphery of a sectoral disk revolving on an independent axis. The lever is released once at each revolution of the disk, and thus allows the platform to drop the gavels.

Claim.—The relative arrangement of the dropper A, link D, lever E, and revolving sectoral disk F, turning on an independent axis, all the parts being combined and operating substantially as and for the purpose specified.

139,396.—*Sleigh-Runner.*—JACOB W. KARN and EUGENE W. KARN, Watkins, N. Y. Application filed April 9, 1873.

Each runner, with its braces and top rail, is made in one piece by bending a single bar of iron into the proper shape.

Claim.—In a sled or sleigh the top rail A, shoe B, and intermediate braces or supports C, all formed of a single continuous piece of metal, substantially as and for the purpose set forth.

139,397.—*Middlings-Purifier.*—NICHOLAS LACROIX, Milwaukee, Wis. Application filed April 12, 1873.

Feed-board attached to shaking-frame. Bolt-cloth vibrated both longitudinally and vertically; air-draft regulated by overlapping valves in inclined sides of case below cloth.

Claim.—1. In a middlings-purifier, the inclined board or feeder b^2 attached to and operating with the shaker *c*, substantially as and for the purposes shown.

2. The means of regulating the tension of the bolt-cloth c^1 lengthwise, viz., the bar-plate or rod c^4, and screw attachments c^3, substantially as set forth.

3. In a middlings-purifier, the combination of the series of bars or rods c^3 provided with screw-threads for regulating the tension of the bolt-cloth c^1 transversely with the reciprocating shaker, substantially as and for the purposes described.

4. The conveyer-case *n*, constructed with inclined overlapping surfaces n^2 and openings n^3, substantially as and for the purposes set forth.

5. In a conveyer-case, the combination of the inclined overlapping surfaces n^2, openings n^3, trough n^4, opening *o*, elongated opening *p*, and sliding shutter or valve p^1, substantially as set forth.

6. A middlings-purifier having the exhaust-chamber *j*, fan k^1, shaker *c* vibrating upon hangers *d*, and a reciprocating wiper, *g*, actuated by a double-threaded screw, *i*, constructed and operating substantially as and for the purposes described.

139,398.—*Lamp-Extinguisher.*—RALPH LANGE, Baltimore, Md. Application filed April 14, 1873.

An auxiliary tube slides upon the wick-tube. It bears a light spring-valve to close the inclining top thereof, a finger-piece, and is weighted at its lower extremity in such manner that when the lamp is inclining the tube rises, allowing the valve to act in extinguishing the light. Notches are cut in its frame, into which the finger-piece may be locked.

Claim.—1. The combination of a weighted extinguisher-tube and a spring-valve to close the same, substantially as set forth.

2. The combination of a weighted extinguisher-tube, a valve to close the same, and a finger-piece for operating the extinguisher-tube, substantially as set forth.

3. The combination of a sliding extinguisher-tube, a valve to close the same, and a finger-piece for operating the extinguisher-tube, and the locking device for securing the extinguisher in either position, substantially as described.

139,399.—*Spark Arrester.*—EDWARD LANNAY, Lima, Ohio. Application filed April 1, 1873.

The upper part of the stack-shell is bent inward and downward, forming an annular chamber, which deflects the sparks down between the shell and a screen. An inverted cone, flanged at the top, is suspended in the stack to deflect sparks through the screen.

Claim.—The described arrangement of flanged conical shell A A' A'' B *b*, slatted screen C, chamber D, and axial deflector F *f*, for the purpose set forth.

139,400.—*Apparatus for Drying Sugar, Salt, &c.*—DANIEL LEE, Boston, Mass. Application filed May 6, 1873.

The steam-pipes and heads have no fixed connection with the cylinder, but revolve centrally within it, one axis and the steam-inlet passing centrally through the head of the cylinder.

Claim.—1. In combination with the rotary drum *a*, the series of steam-pipes *f* connecting the two heads *c* having rotation independently of the rotation of the drum, substantially as described.

2. In combination with the heater-pipes *g*, the lower head *c* acting as a receiver of the condense-water, substantially as described.

139,401.—*Apparatus for Drying Sugar, Salt, &c.*—DANIEL LEE, Boston, Mass. Application filed April 16, 1873.

Within a horizontally-revolving cylinder, open at one end, and having an air-escape pipe provided with a steam-jet at the other, a series of steam-pipes extend from steam-heads fixed to and moving with the cylinder. The steam inlet and exit pipes have stuffing-boxes. The sugar is admitted at the highest closed end, and is fed forward, falling from shell to pipes and from pipes to shell, the moisture being carried off by a current of air induced by the steam-jet and heated by the pipes.

Claim.—1. The rotary cylinder or shell *a* having extending through it the series of steam-pipes *k*, fixed with relation to the shell, and arranged and operating substantially as shown and described.

2. In combination with the shell *a* and pipes *k*, the air-escape pipe *g* having the controlling steam-jet pipe *h* connected with it, substantially as shown and described.

139,402.—*Bleaching Resin.*—ARCHIBALD K. LEE, Galveston, Texas. Application filed May 15, 1873.

Black resin, broken in small lumps, or pulverized, or reduced to a fine powder, and placed in a heated vessel, and while under agitation, is subjected to direct action of jets of steam, either with or without the fumes of sulphur or chlorine. The resin thus treated is passed through a strainer and run into a reservoir or other receptacle.

Claim.—1. The herein-described process of reducing the resin to small lumps, or pulverizing the same to powder, to facilitate the operation of bleaching the same by the direct action of steam and heat, substantially as and for the purpose specified.

2. The process herein described of bleaching resin by the direct action of steam and heat, either with or without the fumes of sulphur or chlorine, while the mass of resin is under agitation, or is being so stirred as to insure its positive and continued disintegration, substantially as set forth.

3. The herein-described processes of bleaching, clarifying, and refining resin—first, by reducing it to a powder or small lumps and then bleaching by the direct action of steam and heat while the mass is under agitation; and then, in a suitable vessel, freeing the liquid resin from the water incorporated therewith through its evaporation, substantially as and for the purpose specified.

139,403.—*Harness-Saddle Pad.*—HENRY LEREW, Panora, Iowa. Application filed March 1, 1873.

Claim.—A harness or saddle pad consisting of the usual leathers, made convex in the center and trimmed down to a thin edge faced with a zinc pad-plate, made concave to receive said leathers, and attached by having its edge turned over their edges, substantially as shown and described.

139,404.—*Curtain-Cord Fastener.*—HARVEY LULL, Hoboken, N. J. Application filed April 15, 1873.

The slide, bearing a cord-knob, has spring-holding fingers that pass through the mortise of the rack and receive a folded spring acting within the rack to press the pawl-tooth into the rack-teeth to hold the same at any position.

Claim.—The folded spring *e* applied between the fingers *e e* that project from the plate of the cord-knob through the slot in the slide, in combination with the pawl-tooth *l* and ratchet-teeth *c*, substantially as specified.

139,405.—*Umbrella-Tip Retainer.*—COMEGYS C. LUSBY and WILLIAM W. WINTER, Philadelphia, Pa. Application filed March 21, 1873.

An elastic cup on the handle for closing over the tips of umbrella and parasol ribs.

Claim.—1. The umbrella-tip retainer having the stiff collar *a*, thin elastic body a^2, and spring-band a^1, constructed substantially as described, and applied to the umbrella or parasol handle in such manner that it may be sprung back from the tips, but not turned inside out or reversed, substantially as specified.

2. The elastic umbrella or parasol tip-retainer having the metallic band a^3 applied to the outer surface of the spring-band a^1, substantially as shown and described, and for the purpose specified.

139,406.—*Churn-Dasher.*—GEORGE W. MCCORMICK, St. Francis county, Ark. Application filed August 20, 1872.

Cross-bar of dasher has air-spaces, and terminates in segmental-shaped ends, which are recessed and perforated for the passage of air. Hinged and perforated flaps work between the end pieces.

Claim.—A churn-dasher, consisting of the recessed cross-bar provided with perforated segmental-shaped ends and the hinged and perforated flaps, substantially as specified.

139,407.—*Lubricator.*—ELIJAH MCCOY, Ypsilanti, Mich., assignor of one-half his right to SULLIVAN M. CUTCHEON and EDWD. P. ALLEN, same place. Application filed April 2, 1873.

Within the upper end of the central tube, extending up into the cup, is a valve, the stem of which passes through and is guided by a bridge. When steam is on, it presses the valve closely against the regulator screw-cap, closing the aperture. When steam is exhausted, the valve drops to the bridge, and allows oil to escape through the tube to the steam-chest. In the side of the cup, near the top, is an opening, in which are placed two pieces of glass, separated so as to leave a chamber between them, to prevent breaking from sudden change of temperature.

Claim.—1. The slotted central tube C, in combination with the bridge *d* having central opening and wings *e e* fitting in the slotted tube, substantially as and for the purpose specified.

2. The central slotted tube C and bridge *d*, constructed as described, in combination with the valve *b*, substantially as and for the purpose herein described.

3. The central slotted tube C and bridge *d*, in combination with the valve *b* and screw-cap D with opening *a*, all constructed and arranged as and for the purpose set forth.

4. The chamber *i*, formed near the top of the cup A by the two pieces of glass *h h* placed in such position as to form the chamber *i* between, substantially as and for the purpose specified.

139,408.—*Bracket for Shelving.*—JOE V. MEIGS, Lowell, Mass. Application filed April 1, 1873.

The bracket is constructed with a projecting support, and connected with the upright by a clasp fitted to its flanged edge, and adjustable to conform to required distances between the shelves, and is supported by its brace below it, having on its end a projection fitted to a ratchet to hold in position.

Claim.—The combination of a bracket-strip having notches, guides, and a detent rack, and a movable bracket having a pawl and clasping-jaws, these members being constructed and operating in combination, substantially as set forth.

139,409.—*Machine for Planing Stone.*—ANDREWS T. MERRIMAN, Chicago, Ill. Application filed April 30, 1873.

Two upright tool-supporting frames are arranged upon a carriage which moves in front of a platform, upon which the stone is supported. The tools carried in the frames are arranged to cut in opposite directions, alternately, from the end toward and to the center, motion being imparted to the carriage upon which they are supported by a screw, which is operated by means of a train of wheels, which is arranged in such a manner as to revolve the screw in either direction, as may be desired.

Claim.—1. The stone-planing machine, consisting of two or two series of cutting-tools, moving in the same plane, and arranged to cut from the corners, alternately, in opposite directions to the center, substantially as specified.

2. The combination of the movable frame M, carrying the friction-wheels L L', geared to revolve in opposite directions, and the large friction-wheel K, substantially as specified.

3. The combination and arrangement of the sliding carriage D, tools G G', screw J, wheel K, wheels L L', gearing P P', trunnioned frame M, weighted rock-shaft T, lever U, and segment *t*, substantially as specified.

139,410.—*Fire-Escape.*—IRA MERRITT, North Bridgewater, Mass., assignor to himself and WILLIAM A. SWEETSER, same place. Application filed May 6, 1873.

A forked lever-clamp is adapted for instant attachment to a window-opening, from which, as from a crane, is suspended a windlass controlled by a screw-brake carrying a rope, by which the person wishing to escape descends.

Claim.—1. The clamp, having the fork *a*, plate *b*, fork-lever *c* and hooked lever *h*, all constructed and arranged substantially as shown and described.

2. In connection with such clamp, the suspended case *m* containing the hook *n*, the shaft *p* and its winch *w*, the barrel *q*, the wheel *s*, brake *t*, spring *u*, and screw *r*, arranged and operating substantially as described.

139,411.—*Drawing-Board.*—HERMAN H. MEYER, Denver, Colorado Ter. Application filed February 17, 1873.

The front edge of the board and a hinged piece at the back have both a strip screwed on to clamp the paper edges. Set-screws then open the hinged back piece, and thus stretch the paper tight for use. It may be double-faced and both adjustable.

Claim.—1. The combination of the board furnished with a clamping-piece, C, the swinging stretch-piece E, likewise furnished with a clamping-strip and the thumb-screws G G, substantially as and for the purpose set forth.

2. The side strips B B, in combination with the boards A and J, the clamping-pieces and stretch-pieces, essentially as and for the purpose set forth.

139,412.—*Fly-Trap.*—ROBERT P. MILLER and WALTER IRWIN MILLER, Lineville Station, Pa. Application filed April 26, 1873.

A circular cap or cover perforated, with an inner case perforated, and an opening on its top for flies to pass into the outer cover or cap; both located upon a base or bottom with openings, which may be closed by a turn of the cover to secure the flies.

Claim.—The fly-trap, consisting of the base A having the inner flange *b* with openings *c*, the rotating case B having its lower edge notched at *c* to coincide with the openings *c*, its top, the passage tube *e*, and the perforated reservoir-cap D, constructed and arranged as specified.

139,413.—*Die for Swaging Carriage-Okps.*—ROBERT R. MILLER, Plantsville, Conn. Application filed December 3, 1872.

The die proper for the formation of the strap part is wholly in the lower block, and the surface of the other block being smooth, a free expansion of the metal to fill the dies is permitted, and any surplus is equally free to be forced out as fin, while the curvature of the blocks aids the movement of the metal from the middle toward the extremities.

Claim.—The swaging-dies A and F provided with the grooves D and *g*, and made respectively convex and concave longitudinally, substantially as and for the purpose specified.

139,414.—*Fire-Proof Safe.*—JOHN E. MULFORD, New York, N. Y. Application filed February 25, 1873.

The safe is surrounded with a frame-work of flanged bars, and the cells between the bars are filled with fire-resisting material.

Claim.—A safe or similar structure surrounded with a frame-work of flanged bars, disconnected at the corners to permit expansion and contraction, and holding a body of fire-resisting material which forms the exterior surface of the safe.

139,415.—*Fire-proof Building.*—JOHN E. MULFORD, New York, N. Y. Application filed February 25, 1873.

A fire-proof plastic composition is used, consisting of asbestus and calcined gypsum united by lime putty, which is held in place by studs of mushroom form attached to walls, girders, doors, or other parts of buildings which are to be protected.

Claim.—1. The fire-proof or fire-resisting composition herein described, adapted for application in the form of plaster to walls or structures of any description.

2. The flanged anchoring-studs C, employed in combination with a fire-proof plaster, substantially as herein specified.

139,416.—*Fire-Escape.*—JAMES O'BRIEN, New York, N. Y., assignor to himself and CHARLES D. LAMARCHE, same place. Application filed May 6, 1873.

A telescopic tube or chute for the conveyance of persons or goods in case of fire. It is mounted on wheels, and is adjustable to any required angle on trunnions by means of a rack and pinion and an adjusting-screw. It has a curved terminus to break the force of the arrival. Its lower extremity is furnished with a lid, and its upper opening with a handle to assist persons in entering.

Claim.—1. The fire-escape for the bodily downward conveyance of persons and goods, when composed of telescoping tubing whose lower section is made with an upward curvature, substantially as herein shown and described.

2. The handle *l* applied to the upper end of the telescopic tubing, which is intended for the bodily downward conveyance of persons, as described.

3. The adjusting-screw E and adjustable brace and rack F arranged on the truck A, in combination with the pivoted telescopic tubes C H I, as and for the purpose described.

4. The lid O applied to the bent lower end of the tube C of a fire-escape, as specified.

139,417.—*Reversible Rotary Cutter.*—EDWARD V. O'NEILL, Philadelphia, Pa., assignor to himself, JAMES KELLY, and ROBERT PILKINGTON, same place. Application filed February 27, 1873.

The cutting-blades are moved radially for use or otherwise by the partial rotation of the hub, and held in position by the set-screw.

Claim.—1. A reversible rotary cutter, in which two sets of blades are arranged radially, and are combined with operating devices, as described, so that one set of blades is retracted when the other is extended, as set forth.

2. In a rotary cutter, the combination, substantially as described, of two sets of adjustable blades, A and A′ with an adjustable hub, B, formed with recesses and projections *a* and *b*, adapted to the inner ends of the said blades.

139,418.—*Flood-Fence.*—AUSTIN ORVIS, Ellington, Iowa. Application filed November 14, 1872.

The lower parts of the posts are stationary, the upper parts pivoted in them so as to bend down stream with the current, extensible bars pivoted on the front or under sides of the posts, and pivoted stakes on their inner sides serving to hold the fence in an inclined position while the flood is passing over.

Claim.—1. The posts A jointed at *a′*, the pivoted bars C C, sections A^1 A^2, and stakes D D, combined to form a flood-fence, as described.

2. The bars C C pivoted to sides of upper sections A^2, and locking in the grooves *a a* of lower sections A^1, as and for the purpose set forth.

139,419.—*Desk and Book-Case.*—JOHN A. PAYNE, New Orleans, La. Application filed May 3, 1873.

The revolving desk, table, and book-case are mounted on an upright pivot and on a horizontal frame or plate, which rests on vertical racks or gear-wheels, by which the desks and book-case may be elevated or lowered at pleasure.

Claim.—The combination of the standard-frame D, shafts F, wheels G, H, and K, racks L, extensible pivot-tube I P R, and frame M with the reading-desk O, writing-desk N, and book-case Q, substantially as specified.

139,420.—*Combined Trunk and Wardrobe.*—JOHN A. PAYNE, New Orleans, La. Application filed April 19, 1873.

Extensible posts, sliding telescopically within each other, are secured in the corners of a trunk, and support a frame to which curtains are attached, thus forming a wardrobe when the trunk is open.

Claim.—The combination, with a trunk, of the extensible posts and wardrobe-frame, substantially as specified.

139,421.—*Shuttle for Sewing-Machines.*—GEORGE REHFUSS, Philadelphia, Pa., assignor to THE AMERICAN BUTTON-HOLE OVERSEAMING AND SEWING-MACHINE COMPANY, of same place. Application filed March 11, 1873.

The lip on the hinged-plate covers the outer side of the recess in which the thread is laid, and allows the needle-thread to slip freely over the shuttle. The elliptic tension-spring bears against the thread between it and the partition, and the spring is adjusted by the nut on the spindle.

Claim.—1. The hinged plate *m* adapted to cover the side opening of the shuttle and confine the bobbin, when provided with the lip *c* to overlap and partly close the recess *b* in the shuttle-case, as specified.

2. The elliptic tension-spring D, constructed substantially as described, and adapted for attachment to a shuttle, as set forth.

3. The shuttle-case having a recessed partition, *d*, and a spring, D, constructed substantially as described, arranged and operating in connection with the partition, as described.

4. The combination, with the spring D, of the screw-spindle *i* and nut *h*, or equivalent devices, for regulating the pressure of the spring against the partition *d*.

139,422.—*Breech-Loading Fire-Arm.*—WESTLEY RICHARDS, Birmingham, England. Application filed May 2, 1873.

Claim.—1. The combination herein described, with the vertically sliding breech-block and hand-lever linked to the same, of the vibrating hammer and tumbler mounted on the axis of the hand-lever, and the vibratory extractor, said parts being constructed and arranged together for operation, substantially as shown and set forth.

2. In combination with the hand-lever provided with a lip on its horizontal arm, as described, the cranked lever-bolt for fastening said hand-lever under the trigger-guard, substantially as shown and set forth.

139,423.—*Ruche-Holder.*—JAMES V. ROCKWELL, New York, N. Y. Application filed March 27, 1873.

A drum for holding ruches and other like trimmings, having an opening at either end for putting in a surplus quantity of the goods.

Claim.—The drum A provided with projecting flanges *a a*, and perforated at one or both ends to receive a filling and an outer layer of ruches or other fine goods, substantially as described.

139,424.—*Corset-Fastening.*—GEORGE OTTO SCHNELLER, Ansonia, Conn. Application filed November 22, 1872.

The eye has a lateral movement by swinging upon a single rivet, and has a lip overlapping the steel to restrict its movement. The metal caps to the steels are secured by being pressed into indentations upon the ends of the steels. Metal clamps secure the binding and fabric at the edges of the spring ends.

Claim.—1. The loop *e* pivoted on the corset-spring, and provided with the overlapping lip A to limit its motion, and with an eye to engage the button *f*, as herein shown and described.

2. The soft metal caps *i i* secured in position upon the ends of the corset-springs A A, by means of the curved seats or recesses *j j*, formed upon the latter, as herein shown for the purpose specified.

3. The metallic clamps *m m*, covering the edge and a portion of each side of the corset-springs A, and secured thereon by means of indentations or compression, for the purpose of securing in position the interposed binding *l* of the covering *k*, as herein shown and described.

139,425.—*Game-Table.*—SIEGFRIED S. SCHINDLER, West Meriden, Conn. Application filed February 21, 1873.

The game-board, which can be played on either side, is pivoted to swing through an entire circle, and is adjustable vertically as a fire-screen, or at an angle to serve as a music and reading desk.

Claim.—The herein-described game-table, consisting of the base A, the hollow pedestal B, adjustable rod C carrying the frame D E E, and with the table F pivoted in the said frame for adjustment to different positions, substantially as described.

139,426.—*Saw.*—SOCRATES SCHOLFIELD, Providence, R. I. Application filed November 25, 1872.

Two alternately-reciprocating saws are arranged side by side and operate in the same saw-kerf.

Claim.—1. The combination, substantially as described, of two saws arranged side by side for operation in the same kerf.

2. The combination of the saws A A′ with a holding-guide, B, substantially as described.

3. The combination of the saws A A′ with a holding-guide, B, shaft E, opposite cranks C C′, connecting-rods D D′, substantially as described.

139,427.—*Twine-Cutter.*—FREDERICK J. SEYMOUR, Wolcottville, Conn., assignor to TURNER, SEYMOUR and JUDDS, same place. Application filed April 8, 1873.

The cutter is made of a single piece of metal curved upon itself. One end is furnished with a stop to limit its motion, and the other is riveted upon the side of a metal twine-holder just below a slot, into which the edge of the blade projects.

Claim.—1. The blade *d*, with a stop, *e*, at one end, and the spring *f* extending from the other end and returning at the back of the blade, and bent and attached to the plate, the blade, stop, and spring being made of a metallic wire or strip, as set forth.

2. A metal twine-holder having a slot in the same, in combination with the twine-cutting blade secured to such holder, and having the cutting-edge within such slot, as set forth.

139,428.—*Refrigerator.*—MATHEW SHAW, Lawrence, Kan. Application filed March 25, 1873.

The provision-chamber connects with flues within the walls and between the lids of the refrigerator for carrying off the foul air.

Claim.—The arrangement of the flues or passages *b b* within the walls of a refrigerator, connecting the interior of the same with the chamber *a* between the lids, in combination with the outlets *i i* from said chamber, as shown and described.

139,429.—*Seam for Leather-Work.*—SAMUEL W. SHOREY, Boston, Mass. Application filed November 2, 1872.

Claim.—A seam for leather-work, consisting of the series of single nails having adjacent points held by twisting them together, substantially as described.

139,430.—*Hasp-Lock.*—ALFRED B. SMITH, Memphis, Mich. Application filed April 11, 1873.

A turning locking-plate is arranged upon the key-post in rear of the spring-bolt, and is held in the locked or unlocked position by a spring which causes projections on the key-post to engage in notches or recesses in the locking-plate.

Claim.—The combination of the turning, locking, and unlocking plate H, having the notches *b* therein, with the locking-pins *c* of the key-post I, and the spring *d*, substantially in the manner and for the purpose described.

139,431.—*Egg-Carrier.*—SETH H. SMITH, North Adams, Mich., assignor of one half his right to W. H. WILLBER, same place. Application filed March 12, 1873.

An egg-carrier formed of rectangular strips of pasteboard, having straight slots alternately arranged on each edge, and folded strips cut and woven into the slots, forming half-pockets, alternately arranged on the upper and under side of the tray.

Claim.—The combination of the flat strips B B with notches *b b*, alternating on both edges as shown, and the bent strips C C cut and fitting into said notches, as shown, and forming half-pockets, all substantially as set forth.

139,432.—*Trace-Fastening.*—FRANCIS M. SNIVELY, Bellaire, Ohio. Application filed February 26, 1873.

The cross-head *d* is inserted in the groove C until it reaches the socket *b*, when it is swung round at right angles to the whiffletree.

Claim.—The socket *a* for the end of the whiffletree, having the two slots *b c* running at right angles to each other, in combination with the cross-head *d*, substantially as specified.

139,433.—*Cooking Utensil.*—EDWIN J. SPRAGUE, Youngstown, Ohio. Application filed March 22, 1873.

On the periphery of the inner pot and extending part way down are several ribs. These are adapted to pass through corresponding slots in the cover of the larger vessel, or, when the inner vessel is raised up and turned so that said ribs are free, to sustain it upon the cover.

Claim.—In a cooking-vessel, such as described, an inner vessel with vertical ribs upon its periphery passing through corresponding notches in the cap-plate of the outer vessel, so that the inner one may rest thereon in the manner and for the purpose described.

139,434.—*Billiard-Cushion.*—WILLIAM ST. MARTIN, Cincinnati, Ohio. Application filed May 23, 1873.

For regulating the tension of a wire, cord, tape, or ribbon, arranged in the cushion, and compensating for the varying lengths of such wire or ribbons, &c., induced by different degrees of heat and cold.

Claim.—1. The mitered corner, made of brass or other suitable material, substantially as and for the purpose set forth.

2. The combination of the metallic ribbon with the compensating-spring, whereby the tension of the ribbon is preserved under the varying conditions to which it is subjected.

3. The mitered corner B, in combination with the arm F and nut G, or their equivalents, for straining a wire, cord, tape, or ribbon, substantially as and for the purpose set forth.

4. The mitered corner B, in combination with the spring K, arm F, and nut G, substantially as and for the purpose set forth.

139,435.—*Lid-Supporter for Trunks.*—JOSEPH STOTT, Norwich, Conn. Application filed January 8, 1873.

Claim.—The lid-supporter herein described, consisting of the knee-jointed bars D C, when the bar C has the slot E made in its lower end, so as to allow the slotted bar to slide upon the screw I to prevent the knee-joint being caught on its center, and to facilitate its attachment for use, substantially as herein set forth.

139,436.—*Insulator for Telegraph-Lines.*—ISAAC I. TATOM, West Point, Ga. Application filed December 7, 1872.

The cylindrical glass insulator, divided so as to inclose the telegraph wire, is secured in a recessed hinged clamp, provided at its outer end with a pivoted latch for locking the clamping-jaws together, and at its inner end with a screw-thread for fastening the whole to the pole.

Claim.—The insulator having the frame B provided at its lower end with the threaded shank D, and its upper end having the offset *a′* and shoulder *b*, hinged block *c*, with the shouldered latch *e*, all constructed and operating in the manner shown and described.

139,437.—*Button-Hole Cutter.*—CHARLES F. TEBBETS and GRANVILLE NUTTING, Fitchburg, Mass., assignors to THE SHOE-MACHINERY MANUFACTURING COMPANY OF CONNECTICUT. Application filed April 16, 1873.

Claim.—A button-hole punch mechanism, consisting of the stationary slotted bed and the vertically-acting blade *d* and punch *e*, moving relatively to the blade and its movement, and combined and arranged to operate therewith, substantially as shown and described.

139,438.—*Carriage-Curtain Fastener.*—NATHANIEL M. TERRY, Lyme, Conn. Application filed May 10, 1873.

☞ When the curtain is to be attached, the button-head is turned at right angles to the studs. The button-hole is then passed over the head, which, upon being forced back into position, is held there by the tension of the curtain.

Claim.—The recessed head A, mounted on and pivoted to the stud or standard B, substantially as and for the purposes specified.

139,439.—*Valve-Gear for Direct-Acting Steam-Engines.*—JOHN TESSEYMAN and EDMUND I. HOWARD, Dayton, Ohio. Application filed January 4, 1873.

A reciprocating cross-head is provided within one of its vertical sides with two substantially horizontal grooves connected at their ends, and diverge vertically at their centers to a distance equal to the throw of the valve, and through suitable mechanism impart motion to said valve. At each end of said grooves is pivoted a spring cut-off for the purpose of changing the course of the wrist-pin that travels therein.

Claim.—1. In a direct-acting engine, a reciprocating cross-head provided with two longitudinal grooves, intersecting at their ends and diverging at their centers, and through suitable mechanism connected with and imparting motion to the steam-valve, substantially as and for the purpose specified.

2. In combination with the grooves H within the plate G, the pivoted cut-offs *h* and springs I, substantially as and for the purpose shown.

3. The valve-gearing described, as a whole, consisting of the reciprocating cross-head E, provided with the groove H, the rock-shaft L and L′, and the valve-rod K, when said parts are constructed and combined substantially as and for the purpose set forth.

139,440.—*Portable Burglar-Alarm.*—JAMES H. TEORE, St. Louis, Mo. Application filed March 12, 1873.

A small portable bell attached to a base, and containing a spring alarm-gear within it, is provided with a spurred hinged bar, adjusted to be set under the edge of a door, so that any attempt at opening the door will, by depressing the bar, release a detent and sound the alarm. The hinged bar is arranged to fold up under the alarm-bell when not in use.

Claim.—In combination with an alarm-bell, the bar G, hinged to the case of the bell, and provided with teeth *a a* and holes *i i*, and the bar G′, hinged to the outer end of the bar G and provided with teeth *b b*, all constructed and arranged as described, so as to be folded within the case when the alarm is not in use, and operate upon the detent of the bell when in use, as herein set forth.

139,441.—*Machine for Cutting Out Pegs.*—JOSEPH D. VINNEDGE, Indianapolis, Ind. Application filed April 1, 1873.

Cutters are attached to the journals of cog-wheels upon the outer ends of horizontal arms, and operated by suitable bevel-wheel gearing. Arms supported by the upright post or standard.

Claim.—1. The arrangement of the double cutters A A′, attached to the opposite ends of the horizontal arms C C′, operated by the drum-shaft F, bevel-wheel O, and the incased gearing S S S S, substantially as shown and described.

2. In a peg-cutting machine, the frame, consisting of the upright post D, horizontal arms C C′, with the housed gearing-cases B B′ attached to the outer ends of said arms, constructed and arranged as specified.

139,442.—*Machine for Staking, Glassing, and Perching Skins.*—WILLIAM A. WATSON, Beverly, Mass. Application filed March 3, 1873.

The skin is forced over the edges of the stakes by the beam, which is provided with vertical reciprocating movement.

Claim.—The reciprocating beam *k*, in combination with stakes *l m*, substantially as and for the purposes specified.

139,443.—*Tool for Inserting and Withdrawing Faucets.*—KARL A. WATTENDORF, New York, N. Y. Application filed April 24, 1873.

A slotted frame provided with several holes for the fulcrum-pin is attached to the wall or other suitable place. To this is attached, by the fulcrum-pin, a lever provided with a hinged cap-piece. The free end of the lever is forked and provided on the under side with a projection, which serves as a fulcrum when withdrawing a cock, the lever being detached from the frame for that purpose.

Claim.—The lever B, capable of being hinged at one end to a suitable frame, and having its other end, D, forked and provided with a hinged cap-piece, C, and a rounded projection, *m*, at the under side near the forked end D, substantially as and for the purpose hereinbefore set forth.

139,444.—*Sewing-Machine.*—GEORGE WEBSTER, Jr., and JOHN F. WEBSTER, Hamilton City, Canada. Application filed February 27, 1873.

The horizontal lever, pivoted to the under side of the bed-plate, and vibrated through the pivoted upright lever and rod, is at its outer end connected with, and it reciprocates, the feeding-bar horizontally. A pin on the shuttle-carrier raises and lowers the feed, and the lower side of the feed-bar, near its connection with its actuating-lever, is supported on an eccentric cam, by which the vertical position or height of the bar when feeding is determined.

Claim.—1. A cam, *c*, on needle-shaft, a pivot-lever, c^1, a rod, c^2, and a Lever, L, combined with the feed-bar in a sewing-machine, as and for the purpose described.

2. The combination, with mechanism c c^1 c^2 and lever L that moves the feed-bar H, of the screw M, applied through the arm N, and to the part c^1, to regulate the extent of movement of said bar, as set forth.

3. The combination, with the feed-bar H, of the subjacent adjustable cam I, as described, for regulating the vertical position of the feed-bar.

139,445.—*Vapor-Generator.*—WILLIAM WELLS, Salem, Mass. Application filed March 26, 1873.

A vessel containing bisulphide of carbon is concentrically arranged within an upright boiler and surrounded with water, by the heat of which vapor is generated. Circulation of the water is kept up by means of a winged wheel revolving in the water within the boiler.

Claim.—The vessels A B, arranged one within the other, in combination with the revolving shaft L and partitions *a*, with or without the pipes F and G, substantially as described, for the purpose specified.

139,446.—*Carrier for Excavators.*—JOSEPH WILLIAMS, Hemmingford, Canada. Application filed February 3, 1873.

The leaves of the aprons are closely fitted together at the joints, in the manner claimed, to prevent the earth from falling through, and the pieces J and K prevent the earth from falling on the track on which the apron travels.

Claim.—In excavating-machines, the construction of the endless apron of leaves E having close-fitting knuckle-joints united by pintles or rods F, and provided with overlapping end pieces composed of side pieces J and quadrant-shaped pieces K, as and for the purposes set forth.

139,447.—*Stop-Motion for Drawing-Frames.*—PLINY J. WRIGHT and JAMES THOMPSON, Holyoke, Mass. Application filed January 21, 1873.

A break in the material passing through the trumpet or the overflow of the can will cause the weighted end of the lever H to be depressed so as to strike the rear end of the loop on the lever Q, and cause its hook to fall and engage a wheel to stop the motion of the machine. Lumps endeavoring to pass through the trumpet will cause the weighted end of said lever H, and consequently the inner end of lever Q, to be raised with a like result.

Claim.—1. The combination and relative arrangement, substantially as described, of the levers H, Q, and P, and trumpet L, to operate as set forth.

2. In combination with the levers H, Q, and P, the adjustable regulating-spring O.

3. In combination with levers H and Q the extension R, provided with roller *r*, or equivalent device, for receiving the upward pressure of the drawing in the can.

REISSUE PATENTS.

5,423.—*Wax-Thread Sewing-Machine.*—EDWIN E. BEAN, Abington, assignor, by mesne assignments, to THE SHOE MACHINERY MANUFACTURING COMPANY, Boston, Mass.—Patent No. 51,363, dated December 5, 1865. Application filed February 20, 1873.

The end of the rocking-shaft above the table is connected by a link with the awl conveying bar, and a cam on the same shaft engages a pivoted latch secured to the presser-foot bar and raises it. A crank-pin on the end of the lower rotating shaft travels in a slot in a pivoted arm which has a pin that enters a groove in a block attached to and which moves the needle-bar, and the cast-off is operated by the projection on the needle-bar. The upper and lower shafts are connected by a link.

Claim.—1. The shaft above the table, in combination with the shaft below the table, and with intermediate connecting devices, operating substantially as described, whereby the two shafts impart the respective movements to the awl and presser-foot above the table, and to the needle and cast-off below the table.

2. The shaft above the table and the presser-foot and thread-guide combined, substantially as described, whereby the shaft imparts motion, as described, to the presser-foot and thread-guide.

5,424.—*Machinery for Trimming the Heels of Boots and Shoes.*—CHARLES H. HELMS, Poughkeepsie, N. Y., assignor, by mesne assignments, to JAMES W. BROOKS, trustee.—Patent No. 31,666, dated March 12, 1861; reissue No. 1,740, dated August 16, 1864. Application filed April 25, 1873.

The boot or shoe is jacked in a vertical frame pivoted to and sliding upon the face of the standard which supports the center shaft. A pattern-plate attached to the heel of the boot or shoe, impinging on a rotating guide attached to the center shaft, limits the action of the cutter in shaping and trimming the heel-blank. The sliding frame is held in position by means of a suitable spring.

Claim.—1. In a heel-trimming machine, the combination, substantially as described, of a rotary-cutter or cutter-stock, and a vertical jack or frame for holding the boot or shoe to be heel-trimmed.

2. The rotary cutter, the vertical jack-frame, and a pattern-plate or its equivalent, combined to operate substantially as described.

3. In combination with the rotary cutter or cutter-stock, fixed or turning on a horizontal shaft supported in a suitable bearing, a sliding jack-frame, substantially as described, that holds the heel-edge up to the cutter against the stress of a spring, and that enables the shoe to be drawn down or controlled in position by the operator by pressure upon the treadle.

4. In combination with the pattern-plate *l*, a roll or circular projection upon the cutter-shaft, substantially as described, against which the pattern-edge bears.

5. In combination with the rotary cutter and the boot or shoe holding mechanism, a guide for running in the rand-crease and a guide, substantially as described, for running upon the counter.

5,425.—*Life-Preserving Stool.*—HENRY T. PRATT, New York, N. Y. Patent No. 100,501, dated March 15, 1870. Application filed September 17, 1872.

Claim.—1. A life-preserver stool having an air-chamber with a tough incorrodible wall of paper material, substantially as before set forth, the same being a new article of manufacture.

2. The combination of the life-preserver stool with the handles projecting beyond the peripheries of the seat and base, substantially as before set forth.

3. The combination of the wooden heads of the life-preserver stool with paper bands for strengthening the same, substantially as before set forth.

5,426.—*Sash-Holder for Carriage-Windows.*—SILAS. E. TOTTEN, Jr., New York, N. Y., assignor to WINFIELD BLODGOOD.—Patent No. 136,793, dated March 11, 1873. Application filed April 25, 1873.

In order to prevent the rattling of the segmental glass windows of a coach-front, a sliding stop is arranged upon a bracket on the sill, and held at any required position against the glass by a set-screw which passes through a slot in the body of the stop.

Claim.—A sliding stop, C, moving on a bracket, E, in combination with a set-screw, D, with or without an elastic pad, F, substantially as described, for the object specified.

5,427.—*Tucker for Sewing-Machine.*—JOSEPH H. BEAN, Cincinnati, Ohio, assignor to FRANCIS W. BROWN, same place.—Patent No. 132,235, dated October 15, 1872. Application filed April 11, 1873.

The tuck, being sewed, is guided by the folding hook-plate, and the tuck previously sewed is guided by the sliding hook-guide, and the plate and guide are adjustable to accommodate tucks and spaces of the desired widths.

Claim.—1. The adjustable folding hook-plate C and sliding hook-guide *b*, in combination with the slotted main plate A of the tucker, substantially as herein set forth.

2. The combination of the hook-plates B C with the plate A and set-screw D, the plates B C both being held in place upon the plate A by the screw D, as described.

3. The adjustable plate C having the hook *c* and gage-arm *c'* so constructed that the former may be arranged in rear and the latter upon one side of the line of the needle, whereby the narrowest tucks can be made, substantially as described.

4. The combination of the adjustable shield E with the hook-plate C, as described.

5. The tucker described, consisting of the main plate A, hook-plates B C, set-screw D, and shield E, constructed and operating substantially as described.

5,428.—*Harvester.*—CHARLES CROOK, New Hope, Pa., assignor to MOSES G. HUBBARD.—Patent No. 17,305, dated May 5, 1857; reissue No. 548, dated May 4, 1858; reissue No. 3,393, dated April 20, 1869; extended seven years.—Division A. Application filed February 20, 1873.

The driving-wheel is provided with changeable gearing to drive the cutters at different rates of speed. The cutting apparatus is free to rise and fall relatively to the main frame.

Claim.—1. Two driving-gears of unequal size or diameters for changing the rapidity of vibration of the cutters.

2. A concentric arrangement of two driving-gears of unequal size for changing the rapidity of vibration of the cutters.

3. The combination of changeable gearing permitting a reduction of the speed of the cutters for reaping, with the cutting apparatus of a combined reaping and mowing machine.

4. A combined reaping and mowing machine, provided with cutting apparatus which is free to rise and fall relatively to the main frame in mowing, and which can be adjusted to any desired height for reaping, and changeable gearing, permitting a change in the speed of the cutters, for purposes and substantially as set forth.

5,429.—*Harvester.*—CHARLES CROOK, New Hope, Pa., assignor to MOSES G. HUBBARD.—Patent No. 17,305, dated May 5, 1857; reissue No. 548, dated May 4, 1858; reissue No. 3,393, dated April 20, 1869; extended seven years.—Division B. Application filed February 20 1873.

The rear brace of the platform-frame extends across and is journaled to the rear end of the main frame, so that the cutting apparatus can be adjusted vertically.

Claim.—The rear sill of the cutter-frame extended across the rear of the main frame, and suspended thereto in brackets or bearings which permit the adjustment of the different heights of cut, substantially as described.

INDEX OF INVENTIONS PATENTED MAY 27, 1873.

[The numbers in parentheses denote the classification of patents.]

Alarm, automatic fire, (24,) H. L. Brown 139,292
Alarm, portable burglar, (24,) J. H. Thorp 139,440
Amalgams, separating quicksilver from, (99,) M. B. Howard 139,314
Bar and hook, clevis, (114,) R. Gibbs 139,381
Bedstead, wardrobe, (62,) Hunter and Van Sickle 139,316
Billiard cushion, (143,) W. St. Martin 139,434
Bleaching liquor, manufacture of, (11,) H. Deacon 139,239
Bleaching resin, (107,) A. K. Lee 139,402
Boiler, wash, (136,) J. Adams 139,349
Boiler, wash, (136,) J. W. Deming 139,301
Book rest, (146,) L. Tarring 139,341
Boot, (16,) I. Hall 139,385
Boot, moccasin, (16,) E. A. Buck 139,234
Boot and shoe bottoms, machine for molding, (16,) S. W. Baldwin 139,354
Boot and shoe heel blanks, machine for manufacturing, (16,) C. W. Glidden 139,382
Boot and shoe heels, machinery for trimming, (16,) C. H. Helms, (reissue,) 5,424
Bottle wrapper, (1,) A. E. Francis 139,308
Brace, shoulder, (38,) N. C. Burnap 139,366
Bracelet, (66,) Grant and Cook 139,311
Bracelet joints, manufacture of, (23,) J. B. Black 139,361
Bracket, shelving, (62,) J. V. Meige 139,408
Buckle, harness, (32,) C. C. Lee 139,253
Building, fire proof, (4,) J. E. Mulford 139,415
Burner, gas, (64,) B. Andrese 139,352
Button hole cutter, (38,) Tebbets and Nutting 139,437
Can, oil, (87,) H. Keller 139,318
Car axle box, (122,) H. E. Marchand 139,322
Car axle, railway, (122,) R. N. Allen 139,226
Car, dumping, (31,) T. Bootsmann 139,362
Car hanging signal cord, railroad, (121,) J. F. Rice 139,262
Car, railway freight, (121,) R. H. Gordon, Sr 139,243
Car ventilator and dust screen, pocket, (106,) J. B. Timberlake 139,278
Card rack, (54,) Danforth and Winchester 139,298
Carriage clips, die for swaging, (31,) B. R. Miller 139,413
Carriage curtain fastener, (31,) N. M. Terry 139,438
Carriage protector, (31,) G. B. Brown 139,364
Carriage spring, (31,) T. Margatroyd 139,325
Carriage spring, (31,) T. H. Wood 139,348
Carriage window sash holder, (24,) S. E. Totten, Jr., (reissue,) 5,426
Cask, beer, (19,) M. Seitz 139,334
Churn dasher, (45,) G. W. McCormick 139,406

Churn, rotary, (45,) G. Walker 139,345
Cigar machine, (100,) H. E. Tylander 139,280
Coffee roaster, (154,) G. W. Dobson 139,377
Coloring metal, (107,) J. Kintz 139,319
Cooking utensil, (154,) E. J. Sprague 139,433
Cooler, beer, (19,) J. Gimlich 139,310
Corset fastening, (80,) G. O. Schneller 139,494
Cradle, self-rocking, (62,) C. Holtz 139,247
Cultivator, (43,) P. Long 139,320
Curtain cord fastener, (62,) J. P. Arnold 139,228
Curtain cord fastener, (62,) H. Lull 139,404
Cutter, reversible rotary, (174,) E. V. O'Neill 139,417
Desk and book case, (62,) J. A. Payne 139,419
Dovetailing machine, (173,) A. Davis 139,299
Drawing board, (54,) H H. Meyer 139,411
Drawing, device for teaching, (54,) A. C. Covell 139,237
Drawing frames, stop motion for, (142,) Wrigh and Thompson 139,447
Egg carrier, (116,) S. H. Smith 139,431
Engine and saw mill combined, reciprocating steam, (130,) L. Brown 139,233
Engine piston valve, steam, (152,) A. Baumann 139,357
Engine, reciprocating steam, (150,) Nicoll and Hollman 139,258
Engine valve gear, direct acting steam, (159,) Tesseyman and Howard 139,439
Envelope opener, (146,) G. S. Hastings, Jr 139,312
Excavator carrier, (51,) J. Williams 139,446
Eye glass, (157,) A. D. Ansell 139,353
Faucets, tool for inserting and withdrawing, (40,) K. A. Wattendorf 139,443
Fence, flood, (52,) A. Orvis 139,418
Fire arm, breech loading, (18,) A. Marelli 139,323
Fire arm, breech loading, (18,) W. Richards 139,422
Fire escape, (79,) J. O'Brien 139,416
Fire-escape, (79,) I. Merritt 139,410
Fire extinguisher, (35,) J. B. Stillson 139,275
Floor clamp, (30,) J. G. Rogers 139,265
Friction mechanism for yarn beams, (95,) H. Chilson 139,236
Fuel and burning the same, artificial, (61,) A. Berney 139,288
Furnace alarm apparatus, blast, (85,) E. Davis 139,300
Furnace door and bit, puddling and boiling, (185,) J. G. Haberfield 139,244
Gaiter, (16,) W. Love 139,331
Game table, (143,) S. S. Schindler 139,425
Gate, nursery, (62,) J. W. Bonghton 139,232
Generator, vapor, (148,) W. Wells 139,445
Grain cleaner, (159,) S. Moore 139,257
Grain, nuts, &c., machine for cleaning, (159,) J. Johnson 139,248
Gutter, metallic, (126,) T. McClunie 139,224
Harness saddle pad, (72,) H. Lerew 139,403
Harrow, (73,) J. F. Gazley 139,309
Harvester, (74,) C. Crook, (reissue,) 5,428
Harvester, (74,) C. Crook, (reissue,) 5,429
Harvester, (74,) J. F. Salberling 139,268
Harvester, corn, (75,) J. and W. Carrothers 139,367
Harvester dropper, (74,) N. Johnson 139,395
Hatchway, (79,) Follett and Brummel 139,307
Heel breasting machine, (16,) V. K. Spear 139,273
Heel stiffener, (16,) L. C. Crowell 139,238
Hinge, (24,) H. D. Bradley 139,290
Hook for hanging flower pots, &c., (24,) I. A. Lovejoy 139,254
Hoop dressing machine, (40,) S. L. Heywood 139,387
Horseshoe nails, machine for making, (103,) E. W. Kelley 139,250
Horseshoe nails, machine for finishing, (103,) R. Ross 139,331
Horseshoe nails, machine for swaging and trimming the points of, (66,) R. Ross 139,332
Hub band for vehicle wheels, (31,) G. H. Johnson 139,317
Inkstand, (146,) W. Read, Jr 139,261
Insect destroyer, (63,) S. W. Thomas 139,277
Iron, manufacturing rolled, (125,) G. W. Billings 139,359
Iron, steel, &c., compound for treating, (85,) Skinner and Goodson 139,335
Journal box, (87,) J. A. Althouse 139,287
Lamp extinguisher, (90,) R. Lange 139,398
Lamp lighting apparatus, (90,) M. A. Lynch 139,255
Lamp, street, (90,) Jacobsen and Burger 139,394
Last and shoe holder, (16,) B. J. Tayman 139,343
Leather cutting tool, (92,) J. Demarest 139,240
Leather work, seam for, (72,) S. W. Shorey 139,429
Lock, heap, (93,) A. B. Smith 139,430
Loom filling fork, (95,) J. H. Knowles 139,251
Loom for weaving piled fabrics, (95,) E. Pickford 139,388
Loom shuttle box mechanism, (95,) R. B. Goodyear 139,384
Lubricator, (87,) H. V. Aiken 139,225
Lubricator, (87,) E. McCoy 139,407
Machinery, preventing rapping noise in, (87,) G. Ames 139,227

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep. In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures. The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1865; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c.	5	Manures	96
Baking	6	Mathematical instruments	97
Baling-presses	7	Medical compounds	98
Baths, closets, &c.	8	Metallurgic processes	99

COMMISSIONER'S DECISIONS.

HORACE BEACH.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Horace Beach for an alleged* IMPROVEMENT IN STOVE-PLATES, *filed December* 23, 1872.—*Decided May* 23, 1873.]

It is not enough that an article of manufacture is new, in the ordinary sense, to render it patentable; it must possess novelty, as the word is understood in the statute, and give evidence of the exercise of invention.

The case of Charles A. Moore (*Commissioner's Decisions*, 1871, p. 249,) commented on and explained.

THACHER, *Acting Commissioner:*

The alleged invention consists in ornamenting sheet-iron for stoves or other articles by etching thereon any ornamental design. The claim is as follows:

"As a new article of manufacture, sheet-iron plates for stoves, upon which figures or configurations of any desired kind have been etched, substantially as and for the purposes herein set forth."

It was urged in argument at the hearing of this appeal that the process itself is new, but no intimation of this appears in the specification or claim. The Examiner cites as references, anticipating the invention claimed, numerous instances of the application of the well-known process of etching, among which are included metallic articles, such as blades of swords, razors, &c. While admitting the correctness of the Examiner's statement, applicant insists that the article manufactured and put upon the market by him is new, as such, and is therefore patentable under the decision of the Commissioner in the case of Charles A. Moore, (*Commissioner's Decisions*, 1871, p. 249.)

Applicant has evidently mistaken the test of novelty which is suggested in the decision referred to above. Since its publication it has been frequently urged that, if an article of manufacture is new in the sense of never having been produced before, it comes within the requirements set forth as necessary in the decision of Moore's appeal.

This interpretation of the decision is erroneous. The third requirement mentioned therein demands that an article of manufacture, to be patentable, shall differ from other articles of the class to which it belongs "*in essential points.*" From this it is understood that the invention must exhibit novelty in the sense in which this word is used in the patent law—that is, there must be evidence of invention to establish patentable novelty in an article of manufacture just the same as in any other alleged invention that is held to warrant the grant of a patent. In the present instance the alleged invention does not offer such evidence of invention as will entitle applicant to a patent therefor. Nothing is claimed for the process. Articles of iron or steel have been ornamented before by the process of etching. This application, therefore, presents a very clear instance of "double use," and is totally devoid of such essential features of novelty as would render it patentable.

The decision of the Examiners-in-Chief is affirmed.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,635.—*Construction of Sheet-Metal Coffins.*—Granted to ISAAC C. SHULER, July 5, 1850. Hearing June 18, 1873.

24,654.—*Pin-Sticking Machines.*—Granted to JOSEPH W. NARAMORE, July 5, 1850. Hearing June 18, 1873.

24,664.—*Elastic Railroad Frogs.*—Granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1850. Hearing June 18, 1873.

24,665.—*Protecting Surfaces of Articles of Iron.*—Granted to THADDEUS SELLECK, July 5, 1850. Hearing June 18, 1873.

24,668.—*Picker-Motion for Power-Looms.*—Granted to WILLIAM STRAMM, July 5, 1850. Hearing June 18, 1873.

24,685.—*Alarm Attachment for Tills.*—Granted to EDWIN B. WHITE, July 5, 1850. Hearing June 18, 1873.

24,688.—*Machines for Boring and Mortising Blind Slats.*—Granted to LEONARD WORCESTER, July 5, 1850. Hearing June 18, 1873.

24,689.—*Corrugating Sheet Metal.*—Granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859. Hearing June 18, 1873.

24,709.—*Harvesters.*—Granted to LEWIS and JACOB MILLER, July 5, 1859. Hearing June 18, 1873.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WICKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OLIN TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brakes.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STUART VANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,158.—*Carding Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JANKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHILA B WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 28, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing,* granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,309.—*Nail Machines,* granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,343.—*Stoves.*—Granted to EDWARD M. MANIGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins,* granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,473.—*Scales,* granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars,* granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1850. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,304.—*Improved Machine for Moving Iron at the Rolls,* granted to CHARLES HEWITT, June 7, 1859.

Claim.—The movable floors, platforms, or supports A B for moving iron or other metal at the rolls while in process of manufacture, constructed and operated as herein described, or otherwise substantially the same.

DISCLAIMERS FILED.

90,973.—CALVIN C. UDELL, Chicago, Ill.—*Improvement in Step-Ladders,* dated March 22, 1870. Disclaims:

"The stiles U, formed of single pieces of material, slotted out at their central parts, and so sprung outward as to form segments T T, as set forth."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 3, 1873.]

6,694.—*Hat and Coat Hook.*—ALBERT D. JUDD, New Haven, Conn. Application filed May 20, 1873.

6,695.—*Striped Fabric.*—CHARLES H. LANDENBERGER, Philadelphia, Pa. Application filed May 17, 1873.

6,696.—*Nubia.*—JAMES PHIPPS, Philadelphia, Pa., assignor to MARTIN LANDENBERGER & Co., same place. Application filed May 8, 1873.

6,697.—*Heating-Stove.*—JACOB BEESLEY, Philadelphia, Pa., assignor to SAMUAL SMITH, same place. Application filed May 24, 1873.

6,698.—*Watch-Hands.*—BADWELL A. GOODELL, Waltham, Mass. Application filed May 24, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date June 3, 1873.]

1,286.—*Petroleum.*—BROWN BROTHERS, Erie, Pa. Application filed May 14, 1873.

1,287.—*Watches.*—COURVOISIER, WILCOX & Co., New York, N. Y. Application filed May 9, 1873.

1,288.—*Shirts.*—WARREN A. FARR & Co., Boston, Mass. Application filed May 16, 1873.

1,289.—*Seats for Chairs, Settees, and Cars.*—GARDNER MANUFACTURING COMPANY, Glen Gardner, N. J., and New York, N. Y. Application filed May 29, 1873.

1,290.—*Tooth-Brushes.*—SAMUEL L. MINTZER, Philadelphia, Pa. Application filed May 6, 1873.

1,291.—*Soap.*—JESSE OAKLEY & Co., New York, and Newburg, N. Y. Application filed May 23, 1873.

1,292.—*Whisky.*—WALSH, BROOKS & KELLOGG, Cincinnati, Ohio, and Covington, Ky. Application filed May 27, 1873.

1,293.—*Whisky.*—WALSH, BROOKS & KELLOGG, Cincinnati, Ohio, and Covington, Ky. Application filed May 27, 1873.

1,294.—*Whisky.*—WALSH, BROOKS & KELLOGG, Cincinnati, Ohio, and Covington, Ky. Application filed May 27, 1873.

1,295.—*Grinding-Mills.*—ALEXANDER W. WINALL, Cincinnati, Ohio. Application filed May 20, 1873.

1,296.—*Medicine.*—CASPER C. ZIMMERMAN, Shoemakersville, Pa. Application filed May 6, 1873.

1,297.—*Whisky.*—JOHN T. M. ORENDORF, Baltimore, Md. Application filed May 26, 1873.

1,298.—*Beverage.*—SAMUEL F. STOWE, Providence, R. I. Application filed May 26, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date June 3, 1873.]

ORIGINAL PATENTS.

139,448.—*Steam-Engine.*—GEORGE H. BABCOCK, Plainfield, N. J., and STEPHEN WILCOX, Brooklyn, N. Y. Application filed November 7, 1872.

A universal-joint bearing on the main shaft, with a universal-joint bearing on the crank, is combined with a cross-head provided with circular bearings so as to form an engine adapted to work perfectly when out of line in any direction. Also has a spherical eccentric with the universal-joint bearing. The spherical boxes of the connecting-rod are combined with cheek-pieces.

Claim.—1. The boxes or brasses I I, forming a cylinder at right angles to the crank-pin, fitted upon the same and inclosed within cheeks g^1 g^2 formed and adjusted in the connecting-rod G, as and for the purposes specified.

2. The combination of the universal-joint bearing on the main shaft B, with the universal-joint bearing on the crank, and with the turnable cross-head bearing *e*, so as to form a complete engine, adapted to work perfectly when out of line in any and all directions, as specified.

3. The combination of a spherical eccentric with the universal-joint bearing on the main shaft B and the universal-joint bearing on the crank-pin, substantially as and for the purposes specified.

139,449.—*Retort-Furnace for Separating Zinc from Gold, Silver, &c.*—EDWARD BALBACH, Jr., Newark, N. J. Application filed May 3, 1873.

Improvement on patents 64,934 and 108,695.

Claim.—1. An oscillating retort-furnace, provided with a hinge, D, at its rear end, upon which it oscillates, and a vent, B, in its top for discharging the products of combustion into the chimney of the furnace, substantially as described, for the purposes set forth.

2. The combination of a hinged discharge-pipe or flue, G, with an oscillating retort-furnace, substantially as and for the purposes described.

139,450.—*Carriage-Top.*—GEORG BOCKSTALLER, Chicago, Ill., assignor of one-half his right to CARL BEER, same place. Application filed October 29, 1872.

The loops are secured to the under side of the top, and the ends of the expanders are passed through them, thereby stretching the top smooth in all directions.

Claim.—A folding top, A, secured to the standards D by means of the loops B E, and expanders C, substantially in the manner and for the purposes set forth.

139,451.—*Construction of Buildings.*—HEZEKIAH H. BRYANT, Boston, Mass. Application filed December 6, 1872.

The flooring-joists are covered with rough boarding, over which is spread a water-proof layer. Furring-strips are laid on this layer, and the spaces between the strips filled with non-combustible material. The ordinary flooring is then laid, resting on the strips and non-combustible material. Furring-strips are secured to the lower edges of the joists at right angles thereto, and a metallic ceiling is nailed to the strips. A liquid coating of fire-proof and water-proof cement is then poured in between the strips to make the joints tight, leaving spaces between the cement and the edges of the joists for the circulation of water or steam. Furring-strips and laths are attached to the lower side of the metallic ceiling to receive plaster.

Claim.—1. The combination of a water-tight shed or substructure provided to the floor of a building, with a metal ceiling, substantially as or for the purposes set forth.

2. The combination of a metal ceiling rendered substantially water-tight, with the joists of a building, wherein the spaces between the joists are kept in communication with each other, substantially as and for the purpose shown and specified.

3. The combination of a water-tight deck, with a superposed layer or coating of non-combustible material and the ordinary floor of a building, substantially as and for the purposes specified.

4. The combination with a metal ceiling of the furring-strips and laths to receive plaster, substantially as shown and described.

139,452.—*Charging and Tamping Platforms for Submarine Blasting.*—JAMES BUSSON, Yates City, Ill., assignor of one-half of his right to HENRY WHITAKER, New York, N. Y. Application filed June 29, 1872.

A temporary cap or cover of large dimensions for the charge to be exploded, which will confine the force of the explosion to the rock; said cap to be submerged by its weight and raised again by a derrick or otherwise.

Claim.—1. In combination with platform A, rim B, substantially as described and shown, and for the purposes intended.

2. In combination with platform A, ribs or braces J J, substantially as described and shown and for the purposes specified.

3. In combination with platform A and rim B, stay F, substantially as shown, and for the purpose specified.

4. In combination with platform A, plate P, and tube *r*, substantially for the purpose set forth.

5. In combination with platform A and braces or stays F, stirrups K K, substantially for the purpose set forth.

139,453.—*Ice-Cream Freezer.*—HOMER B. CAMPBELL, Racine, Wis. Application filed May 3, 1873.

By the first combination the dasher remains stationary, while the cream-can is caused to revolve rapidly and by turns in opposite directions. By the second combination both the dasher and cream can revolve, but in opposite directions and with a reversible motion. The dasher is cast so as to have sharp or knife edges in two directions to facilitate scraping and trituration.

Claim.—1. The frame E having the uprights *a a*, transverse bar *a'*, lever D, and bevel-wheel or segmental rack C', in combination with the pinion *y*, cream-can B', and stationary dasher-shaft *c*, all arranged and operating substantially as and for the purpose shown and described.

2. The frame E having the uprights *a a*, transverse bar *a'*, lever D, and two bevel-wheels or segmental racks, C and C', one of a smaller diameter than the other, with or without the guides *f* or their equivalent, in combination with the pinions *x* and *y*, cream-can B', and rotating dasher-shaft *c*, all arranged and operating substantially as and for the purpose shown and described.

3. The dasher, consisting of the central shaft *c*, scraper *d*, and slotted parallelogram *g*, arranged, constructed, and operating substantially as and for the purpose shown and described.

139,454.—*Parlor-Bedstead.*—FRANCIS E. COFFIN, Boston, assignor of one-half his right to WILLIAM R. HOYT, Chelsea, Mass. Application filed March 13, 1873.

The toilet-case on the top of the bed-frame is combined with a hinged shelf, which serves as a receptacle for toilet articles, and when the bed-frame is turned down, said shelf serves as a support for the frame. The two parts of the folding bed-frame are connected by a double hinge with socket-joints and stops.

Claim.—1. The combination of the toilet-case C, provided with shelves and doors having mirrors M N, with the top R and hinged shelf B, supports *b* and *i*, said hinged shelf forming a portion of the top of the case A, and a support for the part D when turned down, when constructed and arranged to operate in combination with each other, substantially in the manner shown and described, as and for the purposes set forth.

2. The combination of the socket-joints composed of pieces F F' and G G', and provided with end bearings H H' and stops P P' upon the connecting-piece S, with folding side pieces D and E of a turn-out or folding parlor-bed, substantially in the manner described, as and for the purposes set forth.

139,455.—*Manufacturing Picks.*—DANIEL COLLINS, Newark, N. J. Application filed February 14, 1873.

The blank is clamped and swaged by two laterally-sliding dies operated by vertically-reciprocating wedges; the socket is then formed by a descending punch, which is prevented from carrying the blank upward in its ascent by means of a stripper-plate arranged upon the dies.

Claim.—The combination of the reciprocating pieces H, sliding in the recesses formed in the blocks G, sliding wedge-shaped frames F, stripper-plate *e* and piercing tool P, all constructed and arranged for operation substantially as and for the purpose specified.

139,456.—*Friction-Clutch Pulley.*—JOHN D. CROCKER, Norwich, Conn. Application filed March 31, 1873.

A flanged hub, on which a circular sliding wedge is applied for adjusting the clutch or clamping-jaws outwardly against the rim of the pulley for clutching the latter to its shaft; independently adjustable clutching or clamping jaws which are acted on by springs.

Claim.—The pivoted levers C, which are formed with clutching extensions, and are withdrawn from contact with the pulley by springs *s*, in combination with the flanged pulley A, the flange B, hub *a*, and sliding turning-wedge G, substantially in the manner and for the purpose described.

139,457.—*Machine for Cutting Matches.*—PERLEY D. CUMMINGS, MANASSEH SMITH, and JAMES C. JORDAN, Portland, Me.; said CUMMINGS assignor to said SMITH and JORDAN. Application filed March 14, 1873.

Match-card blanks are split by rotary sectional blades and placed alternately, heads and butts, just far enough past each other to allow their being dipped without sticking, requiring no intermediate layers of other material to separate them.

Claim.—1. The combination of the hoppers *a a'*, plungers *c c'* in the mash *e*, with the spring-plunger *m'*, as herein set forth.

2. The combination of the knives *d d'*, plungers *c c'*, spring-plunger *m'*, and the trough *b*, as herein set forth.

3. The slotted hoppers *a a'*, in combination with the carriages D, levers C, tracks E, fingers B, to operate as and for the purpose herein described.

4. The method of slitting match-cards and stacking them in positions ready for dipping at one and the same operation, and in one and the same machine, as herein set forth.

5. The combination of the slotted hoppers *a a'* with the feeding devices herein described, plungers *c c'*, knives *d d'*, spring-plunger *m'*, and trough *b*, as herein set forth.

6. The combination of the gear *n* on the main shaft *g* with the gear *o* on the shaft *p*, pinion *r*, bevel-gear *s* on the shaft *t*, cam *u*, and projections *v* on the vertical shafts *w w'*, as and for the purpose herein set forth.

7. The combination of the gear *n*, the main shaft *g* with the gear *o* on the shaft *p*, pinion *r*, bevel-gear *s* on the shaft *t*, with the cam *x*, and projections *v* on the vertical shaft *w w'*, as and for the purposes herein set forth.

8. The combination of the gear *n* on the main shaft *g* with the gear *o* on the shaft *p*, pinion *r*, bevel-gear *s* on the shaft *t*, cam or projection *y*, and the projections *v*, and the spring *y'*, as and for the purposes herein set forth.

9. The combination of the spring-plunger *m*, the stud *x*, the lever *q'*, cam *v'* having the elevations *o' p'*, and all as herein specified.

10. The guide K, with its points L, in combination with the stacking-trough *m'*, as and for the purpose herein set forth.

139,458.—*Door-Spring.*—DAVID DICK, New York, N. Y., assignor to BARBARA M. BARMORE, same place. Application filed April 15, 1873.

A cylinder containing a spiral spring is secured to the door-frame a little above and near the inner end of the door. A bracket fastened to the door near its top carries a flanged roller, in which works a lever extending out from and attached to the lower portion of the cylinder. In the construction of the cylinder an upper and lower cap and an inside tube are used, the upper end of the coiled-wire spring being inserted in a hole in the upper cap, while the lower end extends outward between the cylinder and the lower cap in the form of an arm, having its outward end bent downward to bear upon and hold the lever rigidly against the roller. There are also ratchet-teeth and notches to regulate tension of the spring, and the general construction serves to make the pressure on the door strongest when it is closed and lightest when open.

Claim.—The combination of the cylinder C, top cap C, spring D, arm *y*, lever H, and roller J, all constructed as described, and arranged on the door-frame and door in the position and for the purposes herein set forth.

139,459.—*Metallic Hose-Coupling.*—EDWARD S. ELMER, Hudson, N. Y. Application filed February 24, 1873.

Recessed locking-lugs are formed upon the interior of the coupling, so when the lugs on the socket part reach the recesses they are thrown into them and held there by the force of a spring-washer.

Claim.—1. The combination of the casing or female part A, having recessed locking-lugs *b b' b b'*, collared swivel B *a*, spring D, and male part C having locking-lugs *c c*, all constructed and operating substantially as and for the purpose specified.

2. The herein-described hose-coupling, composed of the parts A, B, C, and D, the inner end of the male part C, the bore of which is somewhat enlarged, being provided with a packing-ring, *e*, to encircle the extreme end of the swivel B when the parts are locked together, substantially as and for the purpose specified.

139,460.—*Trunk and Strap Fastener.*—JAMES FAIRMAN, New York, N. Y. Application filed March 15, 1873.

A roughened or serrated plate has flanges or lugs on two sides, and is adapted for attachment to a trunk. A screw with an enlarged head, and operated by a key, engages in a central hole in the plate and secures a slotted strap, which is passed between the lugs. A strap that is not slotted may be used by constructing the device with a plate extending across the top from one lug to the other. A headless screw, with its lower end flattened, is then passed through an aperture in this plate and clamps the strap.

Claim.—1. The screw C, constructed with an enlarged or overlapping head, in combination with plate A, so arranged that a strap passed between said parts may be clamped, substantially as and for the purpose set forth.

2. The frame H, in combination with headless screw D, the lower end of said screw being flat, and its upper end being flush with, or little below, the surface of the frame, both parts constructed and operating as set forth.

139,461.—*Revolving Fire-Arm.*—CHARLES FOEHL, Philadelphia, Pa. Application filed April 23, 1873.

A spring pawl attached to the hammer operates upon a ratchet on the end of the shaft upon which the cylinder is rigidly mounted, said shaft having its rear bearing in and extending through the recoil-plate, for the purpose of giving rotation to the cylinder.

Claim.—The spring-pawl *c''* in the hammer *c'*, constructed and arranged to operate upon the ratchet-wheel A, substantially as and for the purpose herein before set forth.

139,462.—*Building-Block.*—SAMUEL T. FOWLER, Brooklyn, N. Y. Application filed April 12, 1871.

The mortar forming the bond for the masonry is held in grooves near the center on all sides of the blocks. Grooves on the perpendicular ends each side of the mortar grooves, between it and each face, receive dry cement or plaster. Dry materials form a bed for the block and an absorbent for any moisture that might otherwise escape to soil the surface of the block.

Claim.—The grooves *b* for the reception of the dry cement, in combination with the mortar-grooves, for the purpose of constructing a wall of building-blocks with wet mortar and dry cement, in combination substantially as described.

139,463.—*Piston-Valve.*—GEORGE H. GIBBS, Nunda, N. Y. Application filed March 13, 1873.

The valve consists of two heads, composed each of a sectional ring tapering toward both ends, and an outer ring, which can be adjusted by two tapering washers fitting into the ends of the sectional taper ring, and made adjustable by nuts on the stem. The steam is admitted between the heads and through annular ports, and is exhausted through the outer open ends of the chest.

Claim.—The valve B, constructed, as described, of the sectional ring *a* tapering at both ends, washers *b b*, and split exterior ring *d*, in combination with the nuts *f f*, substantially as and for the purposes herein set forth.

139,464.—*Sheet-Metal Hinge.*—WILLIAM H. HART, New Britain, Conn. Application filed May 13, 1873.

In a sheet-metal hinge, those portions which have to be removed from the hub of one leaf to make room for the hub of the other are bent out, (instead of being cut out and wasted, as usual,) and form a rigid arm at right angles to the main leaf. This arm passes around the edge of the door and is secured thereto by screws, thus affording a very secure and permanent fastening for the hinge.

Claim.—As a new article of manufacture, the strap or T-hinge, herein shown and described, in which the portion or portions which have to be removed from the hub of one sheet-metal leaf, in order to make room for the hub of its fellow, are bent out instead of cut away, and form a rigid arm, B, standing at about right angles to the leaf, substantially as and for the purpose set forth.

139,465.—*Burial-Casket.*—HOSEA HENIKA and MYRON F. CARDER, Kalamazoo, Mich. Application filed April 15, 1873.

The top of the casket is made of two sections in the form of arcs of a circle. These two sections are attached to pivoted arms, and each rotates independently of the other, if desired.

Claim.—A casket, provided with a top or cover made in two sections, C C', pivoted to the lower portion of the case, and adapted to be independently raised and lowered in combination with supporting-catches *a a*, as described.

139,466.—*Device for Traversing Card and other Cylinders.*—FERDINAND HERBOTH, Newark, N. J. Application filed February 20, 1873.

The bearing has irregular or cam-shaped ends, against which the collars on the shaft bear.

Claim.—In a wool-carding or other similar machine, a shaft-bearing, A, constructed in the manner substantially as described, in combination with collars B B, or equivalent pins or studs, secured to a revolving shaft, C, whereby a reciprocating motion is given to the shaft C simultaneously with the revolution thereof, substantially as and for the purposes described and set forth.

139,467.—*Nut-Lock.*—ABRAHAM C. HULL, St. Louis, Mo., and JOHN S. BROWN, Mount Pleasant, D. C., assignors of one-third their right to ISAAC H. STURGEON, St. Louis, Mo. Application filed April 25, 1873.

The threaded aperture of the nut is made conical. The bolt is split at the end and spread.

Claim.—The combination of a split screw-bolt, A, and a nut, B, having a partially conical and partially cylindrical screw-threaded aperture, substantially as and for the purposes herein specified.

139,468.—*Explosive Compound, or Giant Powder.*—EGBERT JUDSON, San Francisco, Cal., assignor to THE GIANT POWDER COMPANY and ATLANTIC GIANT POWDER COMPANY, same place. Application filed May 13, 1873.

Claim.—The composition of matter, hereinbefore described, consisting of nitro-glycerine intimately mixed with pulverized infusorial earth, nitrate of soda, rosin, and sulphur, or their equivalents, substantially as described, as a new explosive compound.

139,469.—*Iron Post for Wire-Fences.*—DANIEL KAUFMAN, Boiling Springs, Pa. Application filed January 11, 1873.

The end view of the post presents the letter A, formed of angle-iron, the lower ends resting on shoes, cross-bars strengthening the post. Between the top cross-bar and the apex fits the only horizontal rail. Wires passing horizontally through the bars coil on rollers at the end of the section or panel, by which they are stretched.

Claim.—1. An improved fence-post, formed by the combination of the bent angle-iron bar A and cross-bars *a'* with each other, substantially as herein shown and described.

2. In combination with the angle-iron post, constructed as described, the adjustable wires E running through holes in the cross-bars *a*, and vertical bar G, which is notched at its upper end to receive the rail D, substantially as shown and described.

139,470.—*Apparatus for Cooling Rooms.*—ALEXANDER M. LESLEY, New York, N. Y. Application filed March 31, 1873.

Within an upright cupboard closed at the bottom by doors, and perforated at the top, an ice-box is hung by means of pulleys and counter-weights so as to be pushed up out of the way. Object—to lower the temperature and cause a circulation of air in the room.

Claim.—The combination of the closet A A' A'', having doors C C, and perforated at its top, with the ice-box E perforated at its upper part, having perforated partitions *b*, and movable up and down on the guides *d d* by means of the ropes and weights, all substantially as set forth.

139,471.—*Cultivator.*—JOHN P. MANNY, Rockford, Ill. Application filed March 21, 1872.

Claim.—1. The combination, in a cultivator, of the bifurcated tongue-frame, the vertically-adjustable draw-bars E pivoted to the horizontally-swinging pivoted brackets E', and the hinged connecting-rod *e*, all these members being constructed and operating substantially as set forth.

2. The combination of the swing-frame G *g*, drag-bars H, suspension-rods K, and radius-bars J, substantially as set forth.

3. The combination of the swing-frame G *g*, shields M, suspension-rods K, radius-bars J, and drag-bars H, substantially as set forth.

4. The combination of the swing-frame G *g*, radius-bars J, drag-bars H, suspension-rod K, and locking-treadle L, substantially as set forth.

5. The combination of the drag-bar H, cap *j*, radius-bar J, thimble j^2, and bolt j^3, substantially as set forth.

6. The combination of the drag-bar H, the friction-socket h^1, the conical hollow plug h^2, the eye-bolt h^3, and the standard *i*, all these parts being constructed and operating as set forth.

7. The combination of the drag-bar H, the crank-shaped standard *i*, the socket i^2, and the shovel I, these parts being constructed as set forth.

139,472.—*Button-Hole Cutter.*—WILLIAM C. MCGILL, Cincinnati, Ohio. Application filed May 1, 1873.

A triangular cutter is secured to the upper blade of the scissors, and a bar is attached to the lower blade and bent outward at right angles to said blade and then returned upon itself and bent parallel with the main shank. The upper side of the bar is a cutting-edge. The recess formed by the bar gages the distance of the button-hole from the edge of the cloth.

Claim.—In combination with the upper cutting-edge of a button-hole cutter, a lower shank bent at right angles, when arranged to operate substantially as herein shown and specified.

139,473.—*Windmill.*—WILLIAM D. NICHOLS, Batavia, Ill. Application filed April 21, 1873.

A stationary horizontal screw-gear wheel is mounted upon the tower which sustains the mill and upon the movable carriage which carries the two large wind-wheels; a cross-shaft bearing two small wind-wheels, one at each end, placed at right angles to the plane of the large wheels. Upon the said cross-shaft is a worm pinion-wheel which takes into the stationary screw-gear wheel and causes the entire carriage to revolve around said wheel when the wind acts upon the small wind-wheels.

Claim.—1. The combination, with a double-header mill, C C', of a stationary gear-wheel, A, and the two small wind-wheels, E E, borne upon a transverse shaft, D, which is furnished with a worm-pinion, G, all constructed and operating substantially as specified.

2. The combination of the transverse shaft D provided with two small wind-wheels, E E, the worm-pinion G, and stationary gear-wheel A, substantially as specified.

139,474.—*Brush.*—CHARLES W. PALMER, Cleveland, Ohio. Application filed May 5, 1873.

A brush, with one side covered with Brussels carpet, secured with wire-bands to the body; the other side covered with plush, except a portion of one end which has a mirror.

Claim.—The strip A, plush B, carpet C, mirror D, and wire-bands E E, all combined and arranged as described, and for the purpose set forth.

139,475.—*Envelope.*—CHARLES PINK and MARCUS SILVERBERG, Cairo, Ill. Application filed March 8, 1873.

Claim.—An envelope having its sides and ends secured together by means of an inner and an outer adhesive flap, and provided around its interior edge with a strengthening-cord, substantially as and for the purpose specified.

139,476.—*Machine for Tapping Pipe-Fittings.*—JOHN L. POPE, Cleveland, Ohio. Application filed December 12, 1872.

The plate on which the taps are arranged is attached to a circular carrier, which, as it revolves, causes the pinion on the back of the wheel gearing with the pinions on the mandrels to engage with a toothed segment situated on the lower side of the frame, which causes the mandrels to revolve in one direction to enter the taps, and another segment on the opposite upper side of the frame reverses the motion and withdraws the taps. A clamp holds the fitting while being operated upon, and is opened by a cam to drop the joint when finished. Seven systems, of three taps each, are attached to the carrier.

Claim.—1. The rotating carrier C, having, or provided with, a system of teeth, C', and pinion R, in combination with the segmental gears O and P, substantially as and for the purpose set forth.

2. The frame or bed A, constructed as described, in combination with the rotary carrier C and pinion D, as and for the purpose specified.

3. The gears N R and gears K in combination with taps G I H, as arranged, and operating in relation to, and in connection with, the rotary carrier, as and for the purpose substantially set forth.

4. The spindle or mandrel J, nut J', in combination with the feed-screw L, pinion R, and gear N, as arranged and operating substantially as set forth.

5. The cam F', lug E', spring *f*, and slide *i*, in combination with the arms or levers *d f* and jaw *a*, substantially as specified, for the purpose set forth.

6. The spindles J, gears K, driving-gears N R, in combination with the rotary carrier C and segmental gears O P, all constructed and arranged to operate in the manner as and for the purpose set forth.

7. The stationary feed-screw L, in combination with jam-nut M', spindle J, and nut J', as and for the purpose substantially described.

139,477.—*Bouquet-Holder.*—ALBERT F. RANSOM, Glen's Falls, N. Y. Application filed May 7, 1873.

A bouquet-holder constructed of two semi-cylinders, with a band placed near the top, to which a pin is attached, and provided with an eccentric head, by means of which the semi-cylinders are opened and closed.

Claim.—A bouquet-holder formed of the two semi-cylinders A and B, ring or band D, in combination with the pin F with eccentric head E, eye G, and opening C, substantially as and for the purpose hereinbefore set forth.

139,478.—*Cultivator.*—GEORGE R. RICHARDSON, Earlville, and JACOB BEBEL, Rockford, Ill. Application filed November 9, 1869.

The shovel-standards are swiveled to a rocking bail and controlled by handles which are pivoted to the lower part of said standards and suspended from the main frame by a swivel-link.

Claim.—1. The combination of the rocking bail D, pivoted on the tongue-timbers C, the inner shovel-standards E swiveled on the rocking-bail, outer shovel-standards E'', each pivoted to its respective inner standard at top, and connected with it by a link, *b*, near the bottom, and draft-rods *a* connecting each standard with the tongue-timbers, these members being constructed and operating substantially as set forth.

2. The combination of shovel-standards E, swiveled on a rocking-bail, D, with hand-levers G pivoted to the standards and suspended from the main frame by a swivel-link, H, these members being constructed and operating substantially as set forth.

139,479.—*Device for Leveling Millstones.*—WALTER RING, Owen county, Ind. Application filed September 9, 1872.

For setting the spindle perfectly true and leveling the burr-stone.

Claim.—1. In combination with the staff, the staff-block, consisting of two parts, c^1 and c^2, having a vertical and longitudinal adjustment, as herein shown and described.

2. The clutch-box F, provided with the annular collar *f*, eccentric *g*, chuck A, eccentric plate *h*, set-screw *i*, lugs *m* working in the eccentric apertures of the plate *h*, the spindle *o*, the upper clutch-box *p*, and the staff, all constructed and operating as described.

139,480.—*Machine for Corrugating Sheet Metals.*—FRANKLIN ROYS, East Berlin, Conn. Application filed March 6, 1873.

The corrugating-rolls are each supported at their centers, between the bearings, to prevent them from springing, by yoke-shaped adjustable pieces, which run in annular grooves formed in said rolls. In the rear of the rolls is a hinged curved table, which receives the plate as it comes from the rolls in such manner as to prevent it from bending up or down.

Claim.—1. The adjustable center-surface bearings as supports at center of the corrugating-rolls, substantially as set forth.

2. The adjustable hinged table, arranged and operating substantially as and for the purpose set forth.

139,481.—*Gas-Burner.*—DANIEL E. RYAN, Cincinnati, Ohio. Application filed November 5, 1872.

Claim.—A gas burner and pillar having a special or grasping surface of angular or equivalent form on its outer sides, constructed in the manner shown and described, and for the purpose set forth.

139,482.—*Wheel-Quartering Machine.*—WILLIAM SELLERS, Philadelphia, Pa. Application filed December 11, 1872.

The combinations are novel in that the devices for supporting and adjusting the boring-tools are outside of and not between the wheels; spindles or centers and not journal-bearings are used for centering the work; the boring-cylinders are on horizontal surfaces of the adjustable brackets, and not on inclined surfaces, in virtue of which they may be set nearer to the axial line of the work; and the devices for clamping the rims of the wheels support the weight of the work and thus relieve the centers of any strain.

Claim.—1. In a wheel-quartering machine, the combination of a centering-head having inclined slides, a horizontal base-plate bracket movable upon said slides, and boring mechanism mounted upon said bracket, the bracket being arranged substantially as hereinbefore set forth, so as to permit the adjustment of the boring mechanism to bore the crank-pin holes in the driving-wheels at different distances from their centers, and with either crank leading.

2. In a wheel-quartering machine, the combination of a centering-head, a bracket base-plate movable thereupon, boring mechanism mounted upon said bracket, and a centering-spindle mounted in a tubular support on the frame, under which spindle-support the bracket base-plate slides, substantially as set forth.

3. In a wheel-quartering machine, the combination of sliding heads, centering-spindles for accurately centering the wheels to be bored, and adjustable clamping-supports to sustain and hold the rims of the wheels while being bored, substantially as set forth.

4. In a wheel-quartering machine, the combination of centering-heads having symmetrical sides, spindle-supports mounted in the heads, and interchangeable boring mechanism, substantially as set forth, to adapt the machine to the boring of either right or left hand leading-cranks.

5. In a wheel-quartering machine, the combination of the vertically-adjustable supporting-bracket D, flanges for clamping the inner and outer faces of the rim of the wheel, and the clamping bolt and nut, by which all the parts are securely clamped upon the centering head and wheel, substantially as set forth.

139,483.—*Reed-Organ.*—ANDREAS J. SORENSEN, Erie, Pa., assignor to BURDETT ORGAN COMPANY, same place. Application filed March 14, 1873.

The music-rack is hinged at the top and has a chamber for music behind it.

Claim.—The reed-organ top, provided with the hinged door D, its frame-work E E, and having the music-receptacle in the rear of said door, substantially as described.

139,484.—*Fire-Escape.*—JOSEPH A. TALPEY, Somerville, assignor to JOHN HITCHCOCK, trustee, Boston, Mass. Application filed April 23, 1873.

An endless rope is carried over a serrated pulley inclosed in a metallic case, to the axle of which is attached a disk of a diameter considerably larger than the pulley. To the inner face of this disk are attached a number of frictional governor arms, which, by centrifugal action on the inner surface of the case, control the rotation of the pulley. A right-angled pivoted double-arm carries the two portions of the rope in its looped ends and holds them from entanglement during descent.

Claim.—1. In an apparatus for lowering goods, or to be used as a fire-escape, the drum F, provided with the arms *e*, arranged as and for the purposes set forth, the flange F′ and the disk G, in combination with a single rope, J, passing over said drum and held between said arms when the flange F′ and the disk G are of considerably larger diameter than the drum F, for the purpose of increasing the resistance to the revolution of the drum, substantially as described.

2. In combination with the drum F, provided with the arms *e*, and the rope J passing over said drum, and arranged to impart motion thereto in either direction, the friction-weights I I, mounted upon the inner face of the disk G and arranged to operate in conjunction with the casing C, to prevent accelerated motion in the descending object, substantially as described.

3. In combination with the drum F and the rope J, the elbow-lever A, arranged and operating substantially as described, for the purposes specified.

139,485.—*Latch for Coach-Doors.*—JOHN THIELEMANN, Newark, N. J. Application filed March 8, 1873.

A latch that can be opened from the inside of the coach, by simply pushing or pulling in one direction the handle of a lever on the inner side of the door.

Claim.—In a coach-door lock or latch, the bent levers B and C, journaled upon separate pins *a a*², and forming, by the contact of their short arms, one compound lever, in combination with the lock-bolt E, whereby the said bolt E is retracted in the manner substantially as described, for the purposes set forth.

139,486.—*Hand Canceling-Stamp.*—ERNEST H. THOMAS, Louisville, Ky. Application filed May 21, 1872.

Upon the depression of the central rod, the cylinder to which the stamp-holder is secured is rotated, and the arms in which the ink-distributing roller is journaled, are vibrated by bars connecting with the central rod and with the arms and cylinder respectively, the latter of which receives ink from a roller supplied by the fountain-roller. Spring-bearings permit the distributing-roller to follow the irregular periphery of the cylinder.

Claim.—The revolving cylinder C, with its stamp J, inking-rollers D D′, fountain F, and delivering-roller P, in combination with the frame B, the arms H H′, and links G G′, by which they are operated, spiral spring N, and stem L, by which the whole device is operated, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

139,487.—*Drill Gage.*—ALVAH C. TRAFTON, Worcester, Mass. Application filed March 10, 1873.

The device is constructed in one solid piece and will gage the bevel of the two sides, at the point, of a drill, equally, no matter what may be the diameter of the latter, and will also gage the point as regards its angles, and indicate when it is central.

Claim.—As a new article of manufacture, a drill-gage, constructed with a centering-trough, composed of two plates, A B, connected together at right angles, and a bevel-regulating gage, composed of two plates, C D, connected together and permanently affixed to the centering-trough A B, substantially as shown, and for the purposes described.

139,488.—*Step-Ladder Chair.*—HENRY WILLGOHS, New York, N. Y. Application filed May 15, 1873.

Two parts formed step-like and attached by links, so as to be adapted for a chair, a step-ladder, a couch, and a table.

Claim.—1. The parts A and C, having the forms as described, and connected by the links B B, so as to be capable of folding into the several positions described, for the purposes specified.

2. The folding-piece D, hinged to the part C, as shown, in combination with the parts A and links B B, and adapted to serve in broadening the step for the step-ladder, and lengthening the structure for a lounge, as herein specified.

139,489.—*Blast-Furnace.*—JOHN V. WOODHOUSE, Mine La Motte, Mo., assignor to himself, RADCLIFFE B. LOCKWOOD and WM. A. SCOTT, same place. Application filed May 1, 1873.

The furnace is made in three divisions: a detachable hearth, consisting of a sheet-iron carriage filled with brick and lining, in which the pot is formed; an intermediate section connected with the tuyeres, and in which the reduction takes place; and an upper portion or stack supported upon a bed and columns. The hearth supports the intermediate portion, and the two are raised into place by jack-screws. The several parts can be removed for repair.

Claim.—1. A detachable hearth or bottom or floor, as and for the purposes set forth.

2. The cupola or stack independent of the hearth, as and for the purposes set forth.

3. The furnaces in which the reduction takes place, formed independent or detachable from its stack or cupola, as set forth.

4. The combination of a detachable hearth, H, furnace F, and stack S or cupola, as and for the purpose set forth.

139,490.—*Flux for Solder.*—CHAS. E. YAGER, Hudson, N. Y. Application filed February 8, 1873.

Claim.—As a new article of manufacture, a dry granulated soldering salt or flux prepared by first dissolving zinc in muriatic acid, then expelling the acid by evaporation, and finally adding sal-ammoniac, substantially as specified.

139,491.—*Sun-Bonnet for Horses.*—JOHN ANDERSON, Brooklyn, N. Y. Application filed March 25, 1873.

Claim.—1. The new article of manufacture of an elevated sun-bonnet for horses, the body of which is composed of a suitable material having sufficient strength to retain its proper form or shape without the use of the wire or other frame heretofore employed, and strengthened at the edges, substantially as herein specified.

2. The combination, with the body A, of the fastening C D E F G for securing the bonnet to the bridle of the horse in an elevated position, substantially as herein specified.

139,492.—*Currency and Postage-Stamp Holder.*—SAMUEL V. BECKWITH, Brooklyn, N. Y., assignor to himself and T. B. CARPENTER, New Haven, Conn. Application filed January 17, 1873.

A cylinder carries a spring-clamp hinged to one end to hold currency rolled thereon, and a pair of spring-tongs clasping stamps which are inserted within it.

Claim.—As an article of manufacture, the herein-described currency and stamp holder, consisting of the cylinder A, the bar B hinged thereto, the spring *b*, head C, and springs E.

139,493.—*Invalid-Bedstead.*—ABNER BRAY, Chicopee, Mass. Application filed May 10, 1873.

The slats are jointed near the center. Upon the ends of the head-bar are pivoted toothed segments. Plates with retaining-flanges are attached to the rails, and a shaft with a toothed wheel is operated by a winch.

Claim.—The combination, in a spring-bed having the slats hinged or jointed at *d*, of the bar *c*, having the toothed segments *f f* pivoted thereto, with the plates A A provided with retaining-flanges *g*, and the shaft *m* provided with the toothed wheels *n n*, and operated by a winch, *t*, substantially as described.

139,494.—*Clothes-Washer.*—WILLIAM R. BROOKS, Phelps, N. Y. Application filed May 13, 1873.

This boiler attachment is constructed with a crowning false bottom with openings covered with slightly-raised wire over their center, with side pipes and a horizontal perforated tube containing a sliding valve by which the steam and water are regulated.

Claim.—The horizontal perforated tube C, containing the sliding valve or diaphragm D, when arranged upon perpendidular tubes, in connection with a false bottom, substantially as described, and for the purposes specified.

139,495.—*Machine for Skiving Leather.*—JOHN W. CHANDLER, East Corinth, Me. Application filed March 27, 1873.

The table is supported upon an inclined bed, both bed and table moving under a skiving-knife. The table may be adjusted in its inclination, that a long or short tapering cut may be effected, as required. The leather is held in place by a spring tension-roll.

Claim.—1. The combination of the table *b* and bed A with the lip *d* having notches or holes *e e* therein, and set-screw *f*, as specified.

2. The combination of the adjustable table *b*, knife *j*, and bed A with the adjustable spring tension-roll, as set forth.

3. The combination of the lips *f f* on each side of the table *b*, with the clamp *u*, as shown.

139,496.—*Measuring-Funnel.*—JOHN K. CONIC and DAVID H. SHAETZER, West Hempfield township, Lancaster county, Pa. Application filed March 29, 1873.

The rod or stem of the funnel-stopper is supported at its upper end by a cross-arm attached to a hooped handle or bail, which is connected with the sides of the measuring-vessel by removable pins, so that the whole may be conveniently detached from the vessel when desired.

Claim.—The detachable handle B, connected at *b* to the upper edge of the vessel A *a′* by a pin, P, in combination with the cross-brace C, rod F with its flange *c*, spring E, draw-ring D, and stopper G, all arranged and operated in the manner and for the purpose described.

139,497.—*Washing-Machine.*—PHILLIP G. DAHMER, New York, N. Y. Application filed May 15, 1873.

The washing-machine is constructed with a box in usual form, having within it two rotary brushes pivoted by journals through it. From the outside of the box is a thumb-screw operating upon a spiral spring and the journals by which the distance between the brushes is regulated. Over the brushes are two plain rolls. Between them the clothes are passed to the brushes with journals, one working in a slot for adjustment, having a reduced revolution, to hold the clothes for rubbing when in use by the brushes.

Claim.—The pair of rotary brushes E E′, one of which is adjustable relatively to its fellow, as described, and the pair of rollers G G′ rotating at a lower rate of speed, the whole combined and organized substantially as and for the purpose herein set forth.

139,498.—*Whip-Socket Attachment.*—ROBERT DODS, Southington, (Milldale Post Office,) Conn. Application filed April 17, 1873.

The whip-socket is formed with a fillet upon each end, into which the screws are secured.

Claim.—The combination of the straps C C, the washers D D, the screws E E, and fillets *a a* of the whip-socket B for fastening the whip-socket to the dash-board A, substantially as and for the purpose set forth.

139,499.—*Mechanical Movement.*—JAMES B. DOOLITTLE, Wallingford, Conn. Application filed April 3, 1873.

Two segments are arranged upon opposite sides of the crank-pin or eccentric, so that when the crank-pin revolves the said segments rock to and fro in the stirrup, imparting to the plunger, within which the stirrup is formed, a reciprocating movement corresponding to the throw of the crank-pin or eccentric.

Claim.—In combination with the crank-pin or eccentric F and frame D, the two segments H and H′ working within the said frame, so that the rotary movement of the shaft imparts a reciprocating movement to the frame, substantially as set forth.

139,500.—*Heel-Plate.*—HENRY L. DRAKE, Lynn, Mass. Application filed February 8, 1873.

The cutting-edge secures a clean cut upon the lower edge or lift of the heel.

Claim.—A top plate of a boot or shoe heeling machine formed with a cutting-edge, *a*, substantially as described and shown, and for the purposes specified.

139,501.—*Cutter for Meat and Vegetables.*—MARTIN L. EDWARDS, Salem, Ohio. Application filed March 8, 1873.

The lever, carrying the cutting-blade at one end, has a horizontal slot for the crank-pin to work in, and bell-crank at its pivoted end for operating a pawl which engages with a ratchet upon the cutting-block. The pivoted end of the knife-lever is adjustable in a slotted standard. The pawl and the bearings of the crank-wheel are also adjustable. The end of the lever operating the pawl is guided by a slotted arm.

Claim.—1. The knife-lever *i* having a horizontal slot for crank-pin *h* and arm *l*, in combination with slotted standard *j*, substantially as shown and described.

2. The combination of the slotted knife-lever *i*, slotted arm *l*, pawl *m*, and slotted guide *n* with the ratchet *v*, substantially as shown and described.

139,502.—*Kettle.*—WILLIAM J. EVANS and WILLIAM PERRY, New York, N. Y. Application filed April 4, 1873.

A cast or pressed metallic ring is riveted or fastened steam-tight to the top of the kettle for the cover to rest in and upon. The ring has ears to which the bail is attached.

Claim.—The metallic ring B with ears C C, in combination with the top A, substantially as and for the purpose hereinbefore set forth.

139,503.—*Case for Containing Indexes.*—CHARLES E. FELLOWS, Philadelphia, Pa. Application filed April 22, 1872.

The drawers are held within the case by springs at their rear ends, and are provided or not with folding spring-seated leaves or covers.

Claim.—1. The box A, provided with the retractile index-slides B, when constructed substantially as herein shown and described.

2. The double folding retractile index spring-slides B C, when constructed substantially as herein set forth.

139,504.—*Lamp-Post.*—LYMAN A. GOUCH, Yonkers, N. Y. Application filed October 1, 1872.

The post is made of three parts. The trunk beneath the ground is of usual form, its top being conical. The main section has two series of flanges of different diameters, those in the lower part being adapted to receive the upper end of the trunk, and those in the top to receive the lower conical end of the upper section. The parts are adjusted vertically and secured in place by iron wedges.

Claim.—A lamp-post composed of a separate main body, A, a separate upper part, B, and a separate trunk or lower part, C, when said parts or pieces are constructed to have a tapering fit, one within the other, by means of internal flanges in the main body and tapering extensions of the upper and lower parts, essentially as specified.

139,505.—*Hot-Air Furnace.*—WILLIAM O. GROVER, Boston, Mass. Application filed February 14, 1873.

The furnace is made in two entirely distinct parts. The fire-pot and ash-pit and grate can be readily dismembered and access had to the smoke and flame chambers.

Claim.—The air-tight chamber, composed of the metal plates riveted together, and having within it the removable fire-pot and ash-pit plates, the whole being constructed and arranged substantially as shown and described.

139,506.—*Ice-Creeper.*—ABRAM HEULINGS, Philadelphia, Pa. Application filed January 30, 1873.

The creeper is composed of the arms A and B, pivoted together and held open or shut by a spring. Arm B is secured to the shank of a boot or shoe, and arm A opens on the tread or sole, and by means of points or studs on its under side prevents slipping.

Claim.—A folding ice-creeper composed of the arm A, tops or points *b*, sole-plate B, jaws *c*, and the spring E, substantially as and for the purpose shown and described.

139,507.—*Drawing-Board.*—ALONZO HITCHCOCK, New York, N. Y. Application filed September 27, 1871.

The board revolves upon a central pivot. Upon the base, to the left, is a fixed scale, and with the T square and circles minutely subdivided, which are drawn upon the upper right and lower left corners of the board, angles may be drawn upon the paper, as desired.

Claim.—A revolving drawing-table, composed of the board A, the portable frame B, the fixed rest C, the catch A, and the graduated circle F F, one or both, all constructed, combined, and operating substantially as specified.

139,508.—*Work-Basket.*—THOMAS V. HOBBS, Chicago, Ill. Application filed November 11, 1872.

The basket is supported and rotates upon a standard. The basket-rim has pins for holding spools on the under side.

Claim.—1. A combined work-basket and spool-holder, when the basket is provided with pins to receive the spools, substantially as specified.

2. A combined rotary work-basket and spool-holder, when the basket is provided with pins to receive the spools, substantially as described.

139,509.—*Spark-Arrester.*—THOMAS D. KENDRICK, Boston, Mass. Application filed March 22, 1873.

An inverted conical chamber is provided with an annular space, through which water is projected in a sheet across the smoke-stack to extinguish the sparks passing therethrough.

Claim.—A vessel, *d*, provided with an annular or partial opening, *f*, through which a sheet of water is forced for the purpose of extinguishing sparks and cinders, the said vessel *d* being in communication with the water in the boiler by means of the pipe *i*, stop-cock or cut-off *k*, and rod *l*, as herein set forth and described.

139,510.—*Hoop-Skirt.*—GEORGE W. LOCKWOOD and ALBERT CARTER, New York, N. Y., assignors to C. C. CARPENTER & CO., same place. Application filed March 17, 1873.

A series of transverse wires rest on the back of the wearer to prevent the skirt being thrown forward. A series of central braces support the pannier of the skirt.

Claim.—1. The combination, with a pannier hoop-skirt, of a series of spring-braces, I, arranged and operating in the manner described.

2. In a hoop-skirt having a series of transverse wires A B, the vertical central connecting-tape J and spring-braces I, as and for the purpose specified.

139,511.—*Washing-Machine.*—MELVIN N. LOVELL, Erie, Pa. Application filed November 21, 1872.

Attached to the inside of a tub by cleats is the frame of the machine, in which work smooth and corrugated rollers, the upper one yielding by rods and springs over the journals.

Claim.—The combination of the pieces A, the uprights B, the top piece C, the journal-boxes I with projections K, rods L, and springs M, rollers D E, tub F, and pieces N O, as and for the purpose specified.

139,512.—*Turn-Table.*—CHARLES MACDONALD, Hoboken, and CARL O. H. FRITZSCHE, Paterson, N. J. Application filed March 29, 1873.

The radial arms are connected to the cap by the vertical rods, and their outer ends are supported by the tension-rods passing over the cap, so as to throw most of the weight upon the central bearing-surface and reduce the friction between the rails and track.

Claim.—The combination of radial arms C C and rods D D and E E, sustaining said arms upon a central friction-surface, substantially and for the purpose herein set forth.

139,513.—*Card-Case.*—HARRY H. MILLER and THOMAS BENNETT, St. Louis, Mo. Application filed April 9, 1873.

This case consists of a series of pockets which are partially open at the front to disclose their contents, and are strung together with strings or ribbons in such manner that they may all be drawn out to discover their open front, or may be slipped one upon another and be covered by suitable flaps to render the device convenient to carry in the pocket.

Claim.—A ticket or card case composed of a series of open-faced pockets, ribbons, or strings, by which they are strung together, and a cover for inclosing the same, essentially as and for the purpose set forth.

139,514.—*Gas-Governor and By-Pass.*—PETER MUNZINGER, Philadelphia, Pa. Application filed March 11, 1873.

When the pressure of gas becomes too great in the governor it raises the float A, which, by means of the rods *b b* and *c c*, and the levers E, depresses the float G, and thus forces water into the

chamber K so as to seal the end of cylinder O and stop the flow of gas. The valve U may be turned so that the floats are not operated and the flow of gas not interfered with.

Claim.—1. The float A, tank B, levers E, fulcrum F, floats G, tanks H, and the rods *b b c c*, for the purpose shown and described.

2. The floats G, tanks H, pipes M, and the conical chamber K, for the purpose shown and described.

3. The chamber K, in combination with the conical projection L, as shown.

4. The chamber J, composed of the concentric cylinders N O, the inlet and outlet nozzles P P', deflector R, horizontal division-plate R', deflectors S S', and the plate T, for the purpose shown and described.

5. The circular valve U, composed of the concentric cylinders U^1 U^2, radial partitions V^1 V^2, and the deflectors V^3 V^4, for the purpose shown and described.

6. The vertical slot W in the cylinder U^1, for the purpose shown and described.

7. The valve-chamber J, valve U, and conical chamber K, as and for the purpose shown and described.

139,515.—*Landau-Carriage Hook.*—OLIVER S. OSBORN, New Haven, Conn. Application filed April 30, 1873.

The hooked lever is pivoted to a plate secured on one section of a landau-carriage top, and this lever has an eccentric on the under side of its pivoted end; this eccentric forms a bearing for the hook proper. By means of the hooked lever and the eccentric the hook is thrust forward, and after it has caught the stud on the opposite section is drawn back and the two sections are brought into contact.

Claim.—In combination with the hook D attached to one part of the carriage-top, and a securing device, C, upon the other part, an eccentric, F, which forms a bearing for the hook D, and a lever, E, by means of which the said eccentric is made to cause the two points of attachment to approach or recede from each other, substantially as set forth.

139,516.—*Blind-Slat Staple.*—CHARLES H. PALMER, New York, N. Y. Application filed March 12, 1873.

This staple or hook has a long shank, which is screw-threaded to enter the slat, and a short pointed prong, which is forced into the slat, after the long one has been inserted, by a blow from a hammer, which prevents the staple from turning and working out of the slat.

Claim.—The blind-slat staple, substantially as described.

139,517.—*Cigar-Drying Mold.*—NEWTON W. PALMER, New York, N. Y. Application filed March 12, 1873.

The mold has hinged perforated jaws, between which the cigar-bunch is pressed and left to dry. The points of the jaws are extended for receiving a securing-ring, one point having a head for retaining the ring.

Claim.—A sheet-metal cigar-drying mold consisting of hinged jaws having staple C and projecting headed stem *d*, combined with the ring or link clasp *e*, as herein described and shown.

139,518.—*Railroad Tie.*—WATSON PECK and HENRY C. RICHMAN, Lombard, Ill. Application filed April 12, 1873.

A means of economizing timber in railroad ties by using as a rail-bed short blocks hollowed on the under side, and having a dovetailed channel on the upper side, into which a metallic flanged tie-strip is inserted and confined by a corresponding dovetailed block, to which the rail is spiked.

Claim.—The combination of the chairs A, constructed with or without recesses, with the connecting-plate E and blocks D, substantially and for the purpose described.

139,519.—*Billiard-Cue.*—HENVEY PLATTS, Ithaca, N. Y. Application filed March 24, 1873.

Relates to the manner of securing the tips to billiard-cues, and consists in securing a band of any suitable material around the end of the cue that will harmonize with the wood, so as to not injure the effect of the stroke; and in securing the tip to the end of the cue by means of rough or barbed points, projecting out from the end.

Claim.—In combination with a billiard-cue, the non-elastic band *c*, roughened points *i*, and tip, when constructed substantially as shown.

139,520.—*Pipe-Wrench.*—JOHN RIGG, Cleveland, Ohio. Application filed April 4, 1873.

The jaws are capable of adjustment to different-sized pipes. The griping surfaces are always parallel to each other.

Claim.—The herein-described wrench, consisting of the bar A having a disk, B, and a permanent jaw, C, the movable and adjustable jaw D having disk E with holes *e e*, the bar G having disk H and pins *i i*, and the bolt J, when constructed, combined, and arranged substantially as shown, and for the purpose set forth.

139,521.—*Thread Dressing and Winding Machine.*—JAMES SHORT, New Brunswick, N. J., assignor to himself and R. N. WOODWORTH, New York, N. Y. Application filed December 31, 1872.

The thread-beam or spool is mounted on, and easily removable from, the axle, which is squared centrally. Outside the flanges the axle is rounded to rest in the open bearings, and then outside the rounded bearing one end is again squared to enter a mortise in the driving-shaft. As the beam is filled the weighted roller rises, and when full, the pins which connect the weighted arms with the shaft are withdrawn, and the arms provided with the friction-rollers are turned back to permit the removal of the beam.

Claim.—1. The axle C of the thread-beam B, made with rounded bearing parts, and with squared end *d*, in combination with notched bearings in standards *a b*, and the driving-shaft D provided with mortise *e*, substantially as and for the purpose specified.

2. The arms F, carrying friction-rollers *f*, and fixed on the shaft E, in combination with the weighted arms H mounted loosely on the projecting ends of the shaft, and removable pins *g* for locking said parts together, in combination with the roller G and beam B, arranged as shown and described, for the purpose specified.

3. The combination with the spool B mounted on a removable spindle, the roller G placed above and resting on the spool and prevented from longitudinal movement by the flanges or disks of the spool, of the hinged arms F, provided with friction-rollers that bear on the body of the roller, and are retained against said rollers at all times by the weighted arms, as and for the purpose described.

139,522.—*Boiler-Furnace.*—AMOS B. SMITH, Geneva, N. Y. Application filed October 8, 1872.

A series of rakers, balanced by a weight and connected to the safety-valve lever, automatically rake the fire when the pressure falls by the fire becoming clogged with ashes. A coal-reservoir, arranged over the front of the boiler, is provided with chutes passing the fuel to grate, and the fuel becomes heated by outgoing products of combustion in the chimney. The boiler is a return-flue, by which the heat is passed alongside of the reservoir.

Claim.—1. The automatically-acting rakers *h*, constructed and operated substantially in the manner and for the purposes set forth.

2. The arrangement of the coal-reservoir L, provided with one or more chutes, M, in relation to the boiler A, smoke-flue G, and furnace B, substantially as and for the purposes herein shown and described.

139,523.—*Ore-Feeder for Grinding and Crushing Mills.*—CHARLES P. STANFORD, San Francisco, Cal. Application filed November 4, 1872.

An arrangement by which the feeding is accomplished automatically, by the lifting of the stamps stem instead of by the drop, as heretofore, thus supplying the ore at the instant the stamp is raised and out of the way.

Claim.—1. The toothed cylinder E, in combination with the chute D, substantially as and for the purpose above described.

2. The adjustable toothed cylinder E, in combination with the chute D, for the purpose described.

3. The adjustable toothed cylinder E, ratchet-wheel J, and pawl-carrier I with its pawl K, in combination with the rod L and stamp-stem B, substantially as and for the purpose above described.

4. The above-described or equivalent device for feeding ore to crushing-mills, when arranged to be operated by the lift of the stamps, as above described.

139,524.—*Back-Band Hook.*—JACOB STRAUS, St. Louis, Mo. Application filed March 3, 1873.

To increase the efficiency and ease of adjustment of the device employed for attaching traces to, and suspending the same from, the back-band of a harness.

Claim.—The combined buckle and hook described, in which the bars A A and B, and spurs *b* are so arranged as to enable the back-band strap when engaged therewith to occupy a straight line, substantially as and for the purpose specified.

139,525.—*Cutting Attachment for Sewing-Machines.*—JOHN E. WIGGIN, Stoneham, Mass., assignor to HUGH H. MAWHINNEY, same place. Application filed March 29, 1873.

Designed to cut fabrics in a line parallel with the seam being sewn. The stationary blade is secured to a plate provided with a needle-hole, and at such a distance from such hole as it is desired to cut the cloth from the line of stitching. The movable blade is connected with a rocking shaft supported in an adjustable frame, and the shaft is moved from an eccentric and by connections, as shown. The notched arm allows the operator to readily connect or disconnect the operating parts.

Claim.—1. The movable shear E, its shaft F and shaft-box G', adjustable and fixed to the table A by means as set forth, in combination with the stationary shear D and its perforated plate C, applied to the table in manner as explained.

2. The combination of the eccentric lever I, the stud *m*, screw *g*, nut *l*, spring *k*, slotted arm G, and notched arm H.

3. The combination of the shear-shaft F and the eccentric A of the driving-shaft with the eccentric lever I, the stud *m*, screw *g*, nut *l*, spring *k*, slotted arm G, and notched arm H, all constructed and arranged substantially in manner and to operate as specified.

139,526.—*Bag-Lock.*—HERMANN AHREND, Newark, N. J. Application filed April 25, 1873.

The flange on the knob is provided with a notch which, when brought in line with the post, allows the knob and spring-bolt to be pressed inward, and thus release the catch.

Claim.—The spring-bolt E, and flanged knob G, arranged to move in the same vertical line as described, in combination with the post H, for locking the frames A B, with or without the notched disk F, substantially as described.

139,527.—*Railway Car-Brake.*—JOHN S. ANDERSON, Flintville, Wis. Application filed January 25, 1873.

The wheels are journaled independently of each other on short axles, and are prevented from jumping the track by means of the half-elliptic spring which is secured to the under side of the car-body, and the ends of which bear upon the ends of the brake-bar.

Claim.—In an automatic car-brake, the combination of the independent wheels D D' journaled to the frame E, the pivoted truck-frame H, the transverse bars K K', the brake-bar A, and the flat spring B, all constructed and arranged as described, and operating in the manner set forth.

139,528.—*Offal-Drier.*—MATTHEW ANDERSON, Chicago, Ill. Application filed March 3, 1873.

For drying and deodorizing the offal of packing-houses. A jacketed steam-heated cylinder, in which the offal is inclosed, the said cylinder containing an agitator to stir the offal rapidly, and having air-pipes for discharging heated air throughout the mass at the same time, the air being heated in a coil surrounding the steam-jacket, and connecting with the shaft of the agitator, which is hollow and conducts the air, which is to be forced in by a pump or blower, to perforated tubes on the agitating-blades, from which it is distributed so as to circulate thoroughly through the substance to be dried, and then escapes through a pipe to carry off the odor to a fire, if preferred, where it may be burned.

Claim.—The pipe-coil M, applied, as described, around the steam-jacket D, the said coil being connected by suitable tubing with the inside of cylinder A to furnish a supply of air.

139,529.—*Car-Pusher.*—ALVA S. BAILEY, Paxton, Ill., assignor of one-half his right to EDWARD LITTLE, same place. Application filed April 19, 1873.

The main beam is provided at its lower end with a clutch for griping the rail when pressure is applied, and at its upper end with straps, through which a slide-lever is operated. This lever is provided at its upper end with a hook for engaging with the edge of the car, and with a rack upon its upper side, in which the gear upon the end of the hand-lever operates, so that by successive applications the car is moved forward on the track.

Claim.—A car-mover, consisting of beam C, slide D, hand-lever E, and clutch-plates G H I, combined, constructed, and arranged to operate as described.

139,530.—*Till-Alarm.*—JOHN F. BALDWIN, Nashua, N. H., assignor to himself and MILES ALARM TILL MANUFACTURING COMPANY, Providence R. I. Application filed March 19, 1873.

Two vertically-swinging plates, arranged one in front of the other, transversely within the drawer, and operated by pull-rods beneath, have notches in their peripheries, with removable closing pieces, which being shifted make different combinations of the open spaces. A pivoted spring-hook, attached to the under part of the counter, slips over and hangs in front of these plates, so that an open space in each plate, when properly set in line with the hook, permits the drawer to be opened, but when not in line cause a bell to be sounded.

Claim.—1. The combination of one or more swinging notched plates, B C, notch-closers K, a hook, D, and an alarm mechanism, substantially as specified.

2. The notched closers of the front plate or plates, provided with a notch, L, and the hook with a point, M, to operate in the manner described.

3. The rear plate, arranged to be pushed back by the hook against the push-pin N' of the trip-catch, substantially as specified.

4. The arrangements of the pull-rod O, bell-crank N, and the plates B C, substantially as specified.

139,531.—*Portable Water-Closet.*—THOMAS BARRETT, New York, N. Y. Application filed December 11, 1872.

The case of the closet is divided by a partition in two compartments, one forming a water-tank, in which is situated a pump, the piston-rod extending up through the top of the case, and provided with a handle to operate the pump and force the water through a pipe connected to a receiving-bowl arranged over a reservoir, the bottom of the bowl being closed by a trap-valve, balanced by a weight, so that it may be opened whenever the bowl is partially filled, and when empty close automatically.

Claim.—The pump D provided with a handle, *d*, and suspended within the tank B below the top of the case, in combination with each other and with the pipe *c*, bowl F, and tank G, substantially as described, for the object specified.

139,532.—*Bin for Preserving Sweet Potatoes, &c.*—HEDGEMON T. BAETE, Dyersburg, Tenn. Application filed June 27, 1872.

The moisture arising from the potatoes is condensed upon the cover, runs down into the gutters, and escapes.

Claim.—In a bin for preserving sweet potatoes, the inner open-top crib or bin A, with an outside surrounding gutter B, in combination with a cover, E, fitted to rest in said gutter and with a space, H, intervening between the cover and the straw-covered potatoes, as shown, and for the purpose described.

139,533.—*Toy.*—ALBERT R. BATCHELDER, Newburyport, Mass. Application filed March 22, 1873.

The balls are arranged to be rotated in opposite directions at the same time.

Claim.—The toy formed of the balls E E, flexible cords or strings *d d*, wire hooks D, revolving piece C, rod *a*, and handle A, all constructed and arranged as and for the purposes specified.

139,534.—*Folding Stereoscope.*—JAMES A. BAZIN, Canton, Mass. Application filed May 31, 1872.

The staff of a portable stereoscope is hinged so as to be held with the forward portion forming an obtuse angle with the rear or object portion, the eye-glasses swinging on the inclined forward portion, and having a lateral adjustment.

Claim.—1. In a folding stereoscope, a combination of the base A and the plate B hinged at an angle extending outward, with the lens-frame, Fig. 5, either hinged or fixed in a vertical position across the end of the plate B, as described, and for the purpose set forth.

2. In a folding stereoscope, the base A and plate B hinged at an angle extending outward, in combination with the lens-frame, Fig. 5, and adjustable glasses D D.

139,535.—*Manufacture of Cultivator-Teeth.*—JACOB BEBEL, Rockford, Ill. Application filed November 13, 1872.

The blades are cut from a strip of steel of the required width, the two edges of which are beveled, the point swaged, and the tooth slightly curved.

Claim.—1. The shovel steel, hereinbefore described, made in strips, with a beveled cutting-edge on each side, constituting a new article of manufacture.

2. The improvement in the art of making cultivator-teeth, hereinbefore set forth, by cutting the blanks from a strip formed with beveled edges, and then swaging and tempering the edges and points, and finishing the teeth in the manner described.

139,536.—*Mail-Bag Fastening.*—BRICE X. BLAIR, Huntingdon, Pa. Application filed December 19, 1872.

A bag-frame is constructed with a rod on one of its jaws and a rib on the other, on which two clamps are arranged to slide. The clamps meet in the center of the frame, and have eyes at their adjacent ends for the purpose of locking them together.

Claim.—1. The clamps B B, arranged to slide on rod C and rib *a* and hold the two jaws securely together, as set forth.

2. The slides B B, provided with eyes b^2 b^2 on their opposite adjacent ends, applied to a traveling-bag, mail-bag, or their equivalents, as and for the purpose described.

139,537.—*Soldering-Iron.*—GEORGE F. BLAISSE and JAMES BRANNEN, Philadelphia, Pa. Application filed March 20, 1873.

The clamp for holding the iron is provided with flanges and tightening-screws.

Claim.—In combination with the recessed iron E, the clamp D, having the arms d^2 connecting the collars d^1 and d^3, the latter being made in sections, and provided with screws d^4, substantially as specified.

139,538.—*Apparatus for Forcing Water by Direct Condensation of Air.*—JOHN M. BROOKE, Lexington, Va., assignor of one-half his right to THOMAS T. MUMFORD. Application filed January 6, 1873.

An arrangement of pipes, in connection with a double-acting air-pump and water-reservoirs, to permit the condensed air to be transferred alternately from one reservoir to the other, and the water to be expelled at each stroke of the piston of the air-pump.

Claim.—1. The two containing-vessels A and B, in combination with the double-acting air-pump, and the ports, valves, pipes, and cocks, by means of which condensed air is transferred, alternately, from one containing-vessel to the other, to expel the water therefrom at each stroke of the piston of the air-pump, substantially as described.

2. In combination with the containing-vessels A B, the air-pump, and induction and eduction pipes, valves, ports, and cocks, the floats *n* and *n'*, with the weights O and O', valves *f* and *f'*, cylinder *r*, piston *s*, rack *t* engaging with the toothed sectors on cocks Z and Z', and the connecting air-pipes *q* and *q'*, arranged to operate substantially as described.

3. In combination with the containing-vessels, air-pump, induction and eduction pipes, valves, and cocks, the float *n*, mass O, and counterpoise *d* for operating the valve *f*, substantially as described.

4. The combination of the containing-vessels, air-pump, pipes, valves, stop-cocks, and cylinder and piston, by which the stop-cocks are operated, all constructed, combined, and arranged to operate automatically, substantially as described.

139,539.—*Soldering-Machine.*—WILLIAM D. BROOKS, Baltimore, Md., assignor to MARY C. BROOKS and GEORGE D. BROOKS, same place. Application filed May 8, 1873.

The series of burners are arranged to extend obliquely downward from the gas-chamber for the purpose of soldering can-tops of different sizes by placing the cans nearer or farther from the jets of flame.

Claim.—The series of burners C attached obliquely to the gas receiving chamber B, as and for the purpose described.

139,540.—*Egg-Carrier.*—ABNER H. BRYANT, Chicago, Ill. Application filed April 12, 1873.

The strips of one series have slits extending from each edge toward the center, leaving a space undivided. The strips of the other series cross the first and interlace with them, the middle portion of each strip having a slit to receive the corresponding part of the cross-strip, and an irregular-notched slit extending to one edge for introducing and holding the same interlocked.

Claim.—In an egg-carrier interlacing strips, having slits arranged substantially as specified, so that the intersecting parts are interlocked in position.

139,541.—*Coal-Mining Machine.*—WARREN CASE, Troy, Ill. Application filed April 30, 1873.

Claim.—1. In combination with the saw K, clearers *n*, attached to the back of the saw, for the purposes herein set forth.

2. The combination of the shaft E, cog-wheel G *d*, elongated pinion *f*, movable shaft H, wheel I with projection *h*, post *i*, and spring *i*, all constructed and arranged substantially as and for the purposes herein set forth.

3. The combination, with the shaft E, cog-wheel G *d*, elongated pinion *f*, and movable shaft H, of the gears O *t*, shaft *v*, eccentric

w, lever P with box *x*, spring-arms *y y*, and post *k*, all constructed and arranged substantially as and for the purposes herein set forth.

4. The fly-wheel M arranged upon an independent shaft, L, standing at right angles with the driving-shaft H, and connected with it by the worm *s*, and pinion *p*, substantially as and for the purposes herein set forth.

5. The combination of the swinging frame S carrying the saws T T, the bail *i'*, spring *m'*, elbow-lever V, cord or chain *n'*, and windlass W, all substantially as and for the purposes herein set forth.

6. The saw T, constructed, as described, of the disks *s'*, teeth *p'*, and shoes *t'*, all substantially as herein set forth.

139,542.—*Printer's Chase.*—LOUIS G. CHAPUT, New York, N. Y. Application filed May 13, 1873.

Supplemental chases, having wedge-shaped furniture attached, are made of different sizes and provided with arms to fit into the main chase.

Claim.—The supplementary or inner chase B provided with arms C, arranged to interlock with the angles or sides of the main chase A, substantially as described.

139,543.—*School-Desk.*—JOHN W. CHILDS, Kansas City, Mo. Application filed April 22, 1873.

The desk-top has side braces, made of metal, each one having a perpendicular slot, and below said slot a double-curved slot, its two curves being connected together by a vertical part. To the side of the desk-frame is attached a pintle which works in the vertical slot, and a stop-pin which slides in the double-curved slot.

Claim.—The side brace E of the desk-top, having the slot *e* and curved slots e^1 e^2, constructed and combined with the pintle *a* and stop a^1, as and for the purpose described.

139,544.—*Method of Adjusting Circular Saws.*—SANFORD W. CLEMENS, Cleveland, Ohio. Application filed March 22, 1873.

An additional collar is placed upon the saw-arbor, having set-screws passing through it by which the saw is adjusted.

Claim.—The loose collar F, adjustable by a series of screws passing through a fixed collar, C, and the nut-binding device D E, combined with an end-threaded mandrel, B, as described, so that the saw may be made to work true, and prevented from wabbling, in the manner set forth.

139,545.—*Clothes-Wringer.*—DAVID M. COLE, Elgin, Ill. Application filed May 9, 1873.

On one end of the frame is pivoted, near its top, a lever extending down and connecting with the lower roll by a slot in the hub. On top of the lever are arms extending from the pivoted point above and below it, resting upon a plate connected with the journal of the lower roll, by which the gears are thrown into connection by the separation of the rolls in passing through them articles thicker and requiring more power to force them through.

Claim.—1. A clothes-wringing machine provided with gear-wheels adapted to be automatically thrown into and out of operation, substantially as described, for the purpose specified.

2. The gear-wheel I, constructed as described, and attached to the shaft of the lower wringing-roll by means of the recess and pin *j k*, so as to have a slight rotatory movement upon said shaft, substantially as described, for the purpose specified.

3. In combination with the wringing-rolls and gear-wheels, the shipping-lever and sliding cam-plate, substantially as described, for the purpose specified.

4. The guide-bracket O, in combination with the sliding cam-plate and the shipping-lever, substantially as described, for the purpose specified.

5. The shipping-lever, constructed with the arms *u u*, in combination with the irregular raised surface *v v*, substantially as described, for the purpose specified.

139,546.—*Corn-Row Marker.*—ADOLPHUS COOKE and DAVID W. CROSS, Brooklandville, Md. Application filed April 21, 1873.

The wheels are so arranged with reference to the markers that one of the wheels, travelling in a mark previously made, serves as a guide to the machine, and when turned to mark across the field in the reverse direction the sliding frame carrying the markers is moved over to the opposite side.

Claim.—1. In a row-marker which has its outer marking devices arranged to operate in the track of the wheels, the interior marker or markers, which are arranged to operate at row-space distance from the wheels, and the exterior markers, which are arranged to alternately operate simultaneously with the interior markers, and in the track of the wheels, in combination with a lifting-bar, which is common to all the markers, substantially as described, and for the purposes specified.

2. The combination, on the main frame and axle of a row-marker, of the several markers with the sliding frame, the lifting-bar, and its operative lever, substantially as described.

3. The retaining-bolt *d* arranged to engage with and retain a marker in an elevated position, in combination with the spade-lifting device, as and for the purposes specified.

139,547.—*Apparatus for Preserving Fruit.*—LE ROY C. COOLEY, New York, N. Y., assignor to AMANDA T. JONES, Clinton, Wis. Application filed March 1, 1873.

The fruit-cans are connected by means of small tubes, fitting air-tight, to a large central tube, and are ranged on either side of it, extending its whole length. This large tube has two other tubes, provided with suitable stop-cocks, which connect it with the air-pump and preserving-liquid.

Claim.—The apparatus herein described for conveying air and vapor from the preserving jars or vessels and conducting the liquid into said jars after exhaustion, without disconnecting, as specified and shown.

139,548.—*Apparatus for Assorting Nails.*—JOHN COYNE, Pittsburg, assignor to himself and ROBERT CRESSMAN, Etna, Pa. Application filed March 23, 1872.

Claim.—1. An improved nail separating and assorting apparatus, formed of the inclined side plates B B and the central angle and dividing plate A, arranged as shown and described to form longitudinal openings or slots E E, one on each side of the angle-plate, whereby the imperfect nails will be delivered through said openings into suitable receptacles, and the perfect nails will be delivered at the lower end of the apparatus, as specified.

2. The combination of inclined plates B, angle-plate A, and slotted traverse straps D with their set-screws, by means of which the said plates B are made adjustable, as shown and described, for the purpose specified.

3. In an apparatus for assorting and separating nails, the inclined plate or plates B, made adjustable laterally with respect to the plate forming the opposite side of the trough for reception of the nails, as shown and described, whereby the width of the longitudinal opening or openings E E may be varied according to the special work to be done, as set forth.

139,549.—*Compound Steam-Engine.*—WELLSLY W. CRANE, Auburn, N. Y. Application filed April 12, 1873.

A trunk-engine with the high-pressure steam on the trunk side of the piston, and the low-pressure steam exerting its force on the large side of the piston, to which steam is alternately admitted by a single valve. The exhaust steam is admitted by an auxiliary port to the condenser, which forms the bed-plate. The connecting-rod is hollow, and has a rod through its center for adjusting the journal-boxes when worn.

Claim.—1. The combination, in a trunk-engine, of the piston D, ports *a b*, exhaust-port *d*, valve C, and the condenser E placed under one head of the cylinder, all constructed substantially as and for the purpose set forth.

2. In combination with the piston and trunk of a trunk-engine, a hollow connecting-rod in combination with an internal tightening-rod, constructed as and for the purpose specified.

139,550.—*Compound Hose-Pipe.*—MARTIN CRONIN, Washington, D. C. Application filed December 14, 1872.

The lines of hose from several engines are connected to a compound hose-pipe having several branches at its base, in order to throw a stream of greater volume.

Claim.—The compound branch hose-pipe, composed of the main delivery-pipe A, and two or more entering-branches, B, provided with connections, substantially as described, whereby two or more streams of water, through separate lines of hose, may be combined in one, and delivered with increased volume and force, as and for the purposes specified.

139,551.—*Towel Rack and Boot-Jack Combined.*—CLEMENS DARNSTAEDT, Meriden, Conn. Application filed December 19, 1872.

The towel-rack is composed of four upright posts and a series of horizontal bars. Between two of the posts is rigidly secured a boot-jack, and to the bar over the boot-jack is secured a toe-brace. The bar is pivoted so that the toe-brace can be adjusted to the required position over the boot,

Claim.—A combined towel-rack and boot-jack, constructed substantially in the manner shown and described.

139,552.—*Fly-Protector.*—ISAIAH DAUGHERTY, Rocky Station Va. Application filed March 1, 1873.

A protector from flies and other insects constructed with a frame and covered top, with opening above its center covered with wire-cloth, or other open material, for the free circulation of air, mounted on casters for free movement, with a door for entering at its end.

Claim.—The fly-protector, formed by the combination, with a frame, A *b d e f*, supported on casters *a*, of the door B and wire-gauze sides, all as shown and described.

139,553.—*Flour-Mill.*—JEREMIAH DEAN, New Baltimore, N. Y. Application filed February 1, 1873.

Ribs, as constructed on bottom of lower runner-stone, carry the meal around to the discharge-orifice in the curb, and also prevent clogging of the runner.

Claim.—The straight ribs a^1 attached to the under side of the runner A, so as to be tangential to the shaft against which their inner ends abut, and having their outer ends a^2 extended beyond the edge of the shaft, and beveled, as shown and described.

139,554.—*Sawing-Machine.*—WILLIAM DETRICK and JACOB D. CULVER, Greencastle, Ind.; said CULVER assignor to said DETRICK. Application filed November 21, 1872.

The frame of the machine is cast in one piece, and the operative mechanism so constructed as to be reversed, converting it into a right or left hand machine, as may be desired.

Claim.—1. The combination of the frame A with the parts *a b d f*, cast in one piece, the fly-wheel B, reversible guide-bar G, slide D, saw E, and pitman F, all substantially as set forth.

2. The combination of the pivoted dog-bar I with reversible head J, and the pivoted brace K with loop *n*, arranged substantially as and for the purposes herein set forth.

139,555.—*Apparatus for Drying Powdrette.*—LEONIDAS DUVALL, Philadelphia, Pa., assignor of one-half his right to ALFRED T. CLARK, same place. Application filed April 18, 1873.

The excrement mixed with charcoal, being placed in the furnace-heated pan, is lifted, agitated, and moved forward by the hooked spirally-arranged beaters; the dried mass, escaping by an outlet in one end, falls upon a screen, which permits the finer matter to fall through the meshes into a trough, where it is pulverized by revolving blades, the bricks, &c., falling from the screen out of the apparatus.

Claim.—1. The combination and arrangement of the heating-pan A, revolving shaft F, and hook-shaped teeth G, substantially as and for the purposes set forth.

2. The sieve or screen K, arranged in relation to the drying-pan A and the breaking and grinding apparatus L, substantially as and for the purpose set forth.

3. The toothed blades N and the receiver M, in connection with a heating apparatus, for the purpose stated.

4. The pan A, beaters G, sieve K, and breaking and grinding apparatus L, combined and operating substantially as and for the purpose stated.

139,556.—*Apparatus for Separating, Concentrating, and Amalgamating Ores.*—HENRY H. EAMES, Gold Hill, N. C. Application filed April 10, 1873.

Several chutes are placed one above the other, and the lower end of each chute (except the bottom one) is just above the highest point of the one below it, with which it communicates by an opening. Each chute is oscillated horizontally by a cam on one of the shafts at either end of the apparatus, and has a ledge across its bottom to break and equalize the velocity of the current, and to serve as a dam for the mercury used. Each chute is made adjustable by a screw-bolt. When the machine is used as an amalgamator the second and third chutes from the top are lined with copper.

Claim.—1. The inclined zigzag plane formed of adjustable chutes or tables B, ledges *c* with or without copper lining or troughs, and supported in and by frame A, head-block C, and screw-bolt *c* having the "panning" movement, and constructed and operating substantially in the manner and for the purposes set forth.

2. The shafts E and cams D for giving a horizontally-oscillating movement to the chutes or tables B, constructed and operating substantially in the manner and for the purposes specified.

3. The adjustable screw-bolts *c* for adjusting the chutes or tables B to different degrees of inclination, constructed and operating substantially in the manner and for the purposes described.

139,557.—*Automatic Railroad-Car Brake.*—GEORGE ES-EARL, Boston, Mass., assignor to "THE AUTOMATIC CAR-BRAKE MANUFACTURING COMPANY," New York, N. Y. Application filed September 20, 1872.

The brake is applied to the wheels by a cord or chain wound upon a drum when thrown into connection with worm-gear on the axle by means of an electro-magnetic armature. Provision is made, by the automatic separation of the clutch carrying a catch, for locking the brake at a given tension without further winding up the chain.

Claim.—1. The combination of the worm 1, worm-wheel 6, shaft 9, clutch 11, and drum 14 with the chain 34, arranged to effect the automatic unclutching of the drum in the manner explained.

2. The spring-catch 18 and locking arm or button 19 combined with the notched flange 16 of the drum 14, to arrest the rotation of the latter, as explained.

3. The rock-shaft 23, with its arms 22 and 26, operating in combination with the armature-lever 28, and pawls 32, 33, as set forth.

4. The combination of the spring 29 with the weighted arm 26, and armature-lever 28, to receive increased tension after the forward movement of the lever, as explained.

5. The spring 24 and winding-chain 25, arranged as described to produce tension on the said spring by the winding of the brake-pulley in readiness for the restoration of the parts to their normal positions when the armature-lever is released.

139,558.—*Bobbin.*—ANTHONY L. EARLE, Valley Falls, R. I. Application filed May 10, 1873.

The re-enforcing rings are made of a composition of glue, glycerine, and sulphate of lead, or equivalent, so as to be unaffected by heat or oils, and yet so as to be capable of contracting and expanding with the wood of the bobbin, but prevent it splitting.

Claim.—A wooden bobbin, provided with one or more seamless re-enforcing rings or bands, composed of a glue compound possessing substantially the characteristics specified.

139,559.—*Stop-Cock.*—GEORGE W. EDDY, Waterford, N. Y. Application filed March 8, 1873.

Two disks with inclined slotted ears are pivoted to a cross-head which is operated by a double screw-rod. A cam is pivoted to each disk, and is operated by the head of the screw-rod, which forces said disks against the valve-seats.

Claim.—1. The right and left screw P P, the cross-head H, and the disks combined, constructed and operating together in the manner and for the purpose described.

2. The combination of disks C C having obliquely-slotted ears G G, with cross-head H having pivot-pins K K, as and for the purpose set forth.

3. The combination of cams M *d*, slotted cross-head H, and stem-disk N, as and for the purpose specified.

139,560.—*Stop-Mechanism in Looms.*—WILLIAM E. SON, Boston, Mass., assignor to THE AMERICAN STOP-MOTION COMPANY, same place. Application filed April 30, 1873.

To prevent the weft-threads connected with the idle shuttles from passing back onto the lay and interfering with the action of the weft-detector, a guard is attached to the lay consisting of two pieces with a narrow opening between them, so arranged that the threads in front of it cannot pass back through the opening, while the thread last thrown can pass out as the lay falls back.

Claim.—The guard, composed of the parts C, E, and D, or their equivalents, arranged to operate in conjunction with the lay, substantially as described, and for the purpose set forth.

139,561.—*Car-Seat.*—FRANCIS FARRELL, Cincinnati, Ohio, assignor to himself and ABA J. NICHOLS, same place. Application filed April 16, 1873.

The oblong rectangular wooded frame is stayed on its under side with transverse depressed metallic bars, and covered with a cane web or filling.

Claim.—The car-seat bottom, composed of the oblong rectangular frame A, depressed stays B, and cane-web C, as represented.

139,562.—*Bed-Bug Exterminator.*—CALVIN L. FEWELL, Coreicana, Tex. Application filed May 5, 1873.

A cup has an inverted conical cup and chimney passing through its center. Near the bottom of the cup is a grate, and below that an ash-pan. When water is put in the conical cup and fire on the grate, steam is raised, which passes freely through a spout.

Claim.—The combination of the ash-pan A, fire-pot B with grate C, hinged water and steam pot D, chimney G, handles E, and spout *b*, all constructed and arranged substantially as and for the purposes herein set forth.

139,563.—*Car-Starter.*—GEORGE W. FIELD and JOSEPH STEGER, New York, N. Y. Application filed October 8, 1872.

A pawl having a lug at its center to which a chain is attached, and connects with the brake-shaft. The pawl is attached to a bell-crank lever, the same being operated by its connection with the draft-bar. The brake being applied, the pawl is raised and engages with a ratchet on the axle. The draft bar being drawn out in starting again and the brake-shaft released, the pawl acts as a lever, turning the axle partly around, and is then thrown out of connection with the ratchet.

Claim.—The propelling-pawl *a*, cord or chain *d*, windlass *f*, and ratchet-wheel D, in combination with the connections *h j* and draft-tongue E, all arranged and operating substantially as described.

139,564.—*Plow-Truck.*—JOHN FLANAGIN, Pawnee City, Neb. Application filed March 1, 1873.

A triangular frame mounted on wheels, to which plows of different kinds may be conveniently attached.

Claim.—The triangular plow-truck A B B placed upon wheels, having one or more sets of perforations at each end of bar A, and the clevis-bar at the junction of bars B B, as and for the purpose described.

139,565.—*Seed-Dropper.*—JOHN M. FORDEN, Springfield, Ill., assignor to EUGENE L. GROSS, JNO. M. FORDES, JAMES K. WELTER, JOHN O. SLOAN, and JAMES RAYBURN, same place. Application filed May 7, 1873.

The seed-slide is provided with an annular recess, into which the rotating disk fits, the cut-off being stationary upon the slide.

Claim.—The seed-slide C, provided with an annular recess, in combination with the perforated and rotating disk D, and the stationary cut-off G, all constructed and operating substantially as and for the purposes herein set forth.

139,566.—*Machine for Introducing Water and Gas Pipes.*—JOHN FRITZ and WILLIAM C. POOLEY, Memphis, Tenn. Application filed February 20, 1873.

The earth is penetrated horizontally, without disturbing the surface of the roadway or sidewalk for the insertion of water and gas service-pipes, by this machine, which has the usual train of differential gearing, by which the auger-shaft is rotated and at the same time fed slowly forward through the spline and feather, and the screw-thread cut upon it. The long shaft D and bevel-gears transmit motion from the surface to the working point. By reversing the machine, after the drilling is accomplished, the tubes can be drawn through the opening which the auger has made.

Claim.—The combination of the vertical shaft D, gears *d e*, screw-threaded auger-shaft N, rotating cylinder F, feeding-cylinder M, differential gearing G H K L, frame A, and platform B, when constructed in the manner set forth, for the purpose of boring horizontally under the streets and sidewalks for the insertion of gas and water pipes without disturbing the surface, substantially as specified.

139,567.—*Spring Bed-Bottom.*—CHARLES GAMMEL, Utica, N. Y. Application filed March 29, 1873.

The squares and springs are hinged at top and bottom, and the whole is hinged in sections, and is covered with a thick fabric.

Claim.—The combination of the springs, the hinged squares and sections, and the subjacent fabric, as and for the purpose described.

139,568.—*Chair.*—WILLIAM GARDNER, Glen Gardner, N. J., assignor of two-thirds his right to OLIVER L. GARDNER and GEORGE GARDNER, same place. Application filed March 7, 1873.

The seat and back are made from one piece, the front end of said piece resting on the front rail of the chair, and the top of said piece on the top rail of the back-frame. The combined seat and back is supported at the curve by the legs and the lower part of the back-frame.

Claim.—The seat and back A A' composed of one piece, in combination with the rail *a a'* of the front legs, hind legs C, the rail *d*, the back standards D, and the arms E, substantially as and for the purpose set forth.

139,569.—*Device for Removing Sand-Bars in Rivers.*—ALFRED GARNHAM, St. Louis, Mo. Application filed November 1, 1872.

A cable carrying the revolving beaters or arms is anchored in the river-channel above the sand-bar which it is desired to reduce. The radial arms carry fans so inclined as to be rotated by the surface-current, and at the same time to deflect the water radially. The arms when passing near the bottom thus cut away the sand by mixing it with the disturbed current, in which condition it is carried away.

Claim.—The device, having a beater, B, provided with fans C, arranged, when properly submerged and anchored, to be automatically revolved by the current of the stream, substantially as and for the purpose hereinbefore set forth.

139,570.—*Ore-Washer.*—ROBERT GIDLEY, Moore's Mill, N. Y. Application filed April 29, 1873.

Intended for washing the fine iron-ore which passes through the large machines commonly used at the beds.

Claim.—1. The tapering revolving cylinder B provided with internal longitudinal ribs m m, in combination with the interior tapering revolving cylinder D provided with twisting-grooves n n, substantially as herein set forth.

2. In combination with the revolving cylinders B and D, constructed and operating as described, the slotted tapering revolving cylinder C provided with interior perforated lining G, substantially as herein set forth.

139,571.—*Butter-Worker.*—WARREN N. GOLDEN, Coldwater, Mich. Application filed March 17, 1873.

The butter-tub and two horizontal rollers within, in line, one on each side of the center, revolve so as to press the butter between them, inclined projecting flanges on the rollers adding to their efficiency. The crank-shaft, which revolves one roller, carries a pinion which meshes with an annular ratchet on the periphery of the tub. This in turn revolves a pinion on the opposite side, and thus operates the opposite roller.

Claim.—1. The butter-workers, having paddles, with the end-curve c^1 and flat surface c^2, as and for the purpose described.

2. The bar E^2, hinged or secured, detachably, to uprights $a^1 a^1$, and combined with the middle bearing D, as and for the purpose set forth.

3. Two butter-workers, having independent shafts revolving in opposite directions, and each with its own pinion combined with a racked butter-holder, F, as described, so that one crank, operated by a single person, can turn two butter-workers, as well as the butter-holder, by the same movement, and thus do nearly, or quite, double the usual amount of work.

139,572.—*Animal-Traps.*—JOHN GOULD, Clinton, Pa. Application filed March 29, 1873.

An automatic cage-trap, self-setting by the aid of the prisoner's efforts to escape.

Claim.—The combination of the pivoted or tilting platform E K, connecting-rods F N, levers G O, pivoted rods H P, bent lever-catches I Q, cam-levers J R, stop-springs S T, gear-wheel V having pins U projecting alternately from its opposite sides, coiled spring Z, gear-wheel B', shaft C', cranks D', and connecting-bars E' with each other and with the three boxes A B C, drop-doors F', and wire drop-gate M, substantially as herein shown and described.

139,573.—*Dyeing Fabric.*—FRANZ G. GRAUPNER, Evansville, Ind. Application filed May 3, 1873.

Muriatic acid and anvil-dust are placed in a stone jar and subjected to a sand-bath to evaporate, and to this mixture is added water, quercitron, logwood, and chromate of potash.

Claim.—1. The combination of oxyduloxyd of iron or anvil-dust with muriatic acid, as a base for dye, substantially as specified.

2. The dye, herein described, compounded of the materials and substantially in the manner set forth.

139,574.—*Mangling or Wringing Machine.*—THOMAS HALL and JAMES NEWTON, of Lawrence, Mass. Application filed March 1, 1873.

A machine with rolls, table, and endless band in ordinary form, having suspended from the upper roller journals, rods, or stirrups connected with an adjusting-screw pivoted to a lever having a fulcrum within the supporting-frame and extending to its center, and then connected to a pivot extending into cells in the cross-bar of the frame, by which pressure is given to the rolls by a spiral spring surrounding it.

Claim.—The combination of the springs K, levers H, adjusting-screws G, and stirrups F, with the pressure-roller C, substantially as specified.

139,575.—*Dumping-Car.*—JOHN M. HANFORD and JOHN WOOD, Middletown, N. Y. Application filed April 12, 1873.

The car-body is divided into two sections, each of which is longitudinally pivoted. The sides are supported at their ends upon the bolsters, and may be either attached to or detached from the pivoted bottoms by means of suitable fastening devices.

Claim.—1. The combination of the bolsters, the centrally and longitudinally-pivoted bottoms, the sides extending over the bolsters at each end, substantially as specified.

2. The combination with the bolsters and centrally-pivoted bottom of the sides, the detachable fastenings, and the radial arms or braces, substantially as specified.

3. The combination with the centrally-pivoted bottom and side pieces G, extending over the bolsters, of the segment ends, and the guard corner-plates c, substantially as specified.

139,576.—*Washing-Machine.*—JAMES W. HANNAH, Sticklerville, Mo. Application filed April 26, 1873.

The rubber is constructed in semicircular form, with its ends and intermediate plates scalloped upon their convex edges, and is suspended upon journals over the bed, composed of rolls, with an outer cover of zinc.

Claim.—The rubber formed by the combination of the semicircular end plates F and the semi-ring intermediate plates H, scalloped upon their convex edges, the cross-rounds F, the shaft G, the levers I, and handle J with each other and with the box A B C, substantially as herein shown and described.

139,577.—*Sole-Pressing Machine.*—CHARLES M. HAYDEN, Hanover, assignor to himself and ZENAS M. LANE, East Abington, Mass. Application filed May 6, 1873.

Upon a horizontal wheel is placed a number of bed-plates of the configuration of a boot or shoe sole. The wheel has an intermittent rotary movement in conjunction with the downward intermittent movement of the platen.

Claim.—In combination with the vertically-reciprocating pattern or die-block e, the intermittently-rotating wheel o with its die-plates p, operating substantially as shown and described.

139,578.—*Machine for Moving Logs.*—GEORGE M. HINKLEY, Milwaukee, Wis., and ALEXANDER RODGERS, Muskegon, Mich. Application filed February 1, 1873.

The log-turning device is provided with means for pushing the logs from the log-way onto the saw-carriage.

Claim.—1. The bar A having the pivoted and weighted push-bar E arranged on it, in the manner shown and described.

2. The combination of the bar A and its actuating devices, in the manner and for the purpose specified.

3. The combination of the cross-head M, rod Q, ways N, chain T, and chain-drum U, and the driving-drum V, and the reversing driving-gear, substantially as specified.

139,579.—*Gas-Regulator for Vulcanizers.*—GEORGE M. HOPKINS, Albion, N. Y. Application filed October 19, 1870.

An adjustable index attached to a steam-gage is arranged so as to (at a given pressure) strike the stem of a float resting on the surface of mercury in a closed vessel, causing the liquid to rise and cover the end of a gas-inlet. The gas entering will be but a small amount escaping from a minute opening in the upper part of the inlet-pipe.

Claim.—The combination of the gas cut-off C with the steam-gage A, substantially as and for the purpose hereinbefore set forth.

139,580.—*Fruit-Jar.*—AMANDA T. JONES, Clinton, Wis. Application filed February 15, 1873.

A hole in the top of the cover, for exhausting the air from the jar, is closed by a removable plug having a button at its lower end for holding it in place. The cover is provided with lugs to fit into recesses in the top flange of the jar to prevent the cover from turning.

Claim.—1. The lugs g on the cover B, as shown and described, for the purpose specified.

2. The combination of the jar A, having the flange a, provided with the recesses or depressions d, the cover B with the lugs g, and the bar E with the hooked ends f, substantially as described.

3. In a concavo-convex cover for fruit jars, the removable plug or stopper J having at its lower end the button j, which passes through a slot in the bottom of the circular opening in the cover B, adapted to be turned transversely in said slot and hold the plug in place, as specified.

4. The fastening-bar F, having a circular central opening fitting around a shoulder in the top of the cover, and held in place by the means of the removable plug J, as shown and described.

139,581.—*Preserving Fruit, Vegetables, &c.*—AMANDA T. JONES and LE ROY C. COOLEY, New York, N. Y. Application filed January 11, 1873.

The fruit is placed in the vessel and the air exhausted by a pump, the vessel filled with fluid at 120° Fahrenheit. When air-bubbles cease to rise the vessel is sealed.

Claim.—The process herein described for preserving fruit, vegetables, and other perishable articles of food, substantially as specified.

139,582.—*Lamp-Bracket.*—GEORGE JONES, Peekskill, assignor to THOMAS J. FISHER, New York, N. Y. Application filed April 19, 1873.

A lamp-bracket, in two parts, connected by a screw, the joint so constructed that the connection serves to brace the lamp-holder to prevent sagging, and that the part, if broken, can be replaced without the expense of both.

Claim.—The ring, connected with the bracket by overlapping lugs, held detachably, as described, so that the parts may be disconnected in packing, and be easily and separately replaced when either is broken.

139,583.—*Stove-Grate.*—WILLIAM J. KEEP, Troy, N. Y. Application filed April 4, 1873.

The transverse bars may have a horizontal vibratory motion, and also a vertical rotary motion. The bearings of the grate are so protected as not to become obstructed by ashes or other substances.

Claim.—1. A stove-grate provided with transverse bars, which are capable of a vibratory motion in a horizontal plane, and of a semi-rotation in a vertical plane, upon or around the center of vibration, substantially as and for the purpose specified.

2. In a stove-grate a series of transverse grate-bars suspended from or upon a central longitudinal supporting-bar, so as to be capable of horizontal vibration at their points of suspension, substantially as and for the purpose shown.

3. The connecting or vibrating bar E provided with the openings c, in combination with the grate-bars D provided with the curved spurs d''', substantially as and for the purpose set forth.

4. In combination with a central, pivotal, or supporting-bar, a shank so arranged that by vibrating its outer end sidewise its inner portion shall communicate to the ends of the lateral grate-bars a vibratory motion in a contrary direction, substantially as and for the purpose shown and described.

5. The shank F capable of the motion described, and combined with the pivotal bar C, and the vibrating or connecting bar E, substantially as and for the purpose specified.

6. In combination with the bar C provided with the recess C' and with the shank-bar F, the lips c''' secured upon said pivotal bar, and extending over said shank-bar, substantially as and for the purpose shown.

7. The pivoted end grate-bars D', provided with the spurs d''', in combination with the ends A' of the bed-plate provided with the spurs a', substantially as and for the purpose set forth.

8. The hereinbefore-described fire-grate as a whole, when its several parts are constructed and combined to operate in the manner and for the purpose shown and described.

139,584.—*Sewing-Machine Fan Attachment.*—EDWARD KEMPE, assignor to himself and NORTON C. NEWTON, same place. Application filed April 16, 1873.

A clamp is adjusted to the edge of the table and supports a rocker-shaft attached by pivoted connections to the wheel or needle-arm, all being above the table.

Claim.—The combination of the detachable standard A and rock-shaft B with the operating-wheel or arm of a sewing-machine, by means of the rods f and i, or other suitable connecting devices, substantially as specified.

139,585.—*Middlings-Purifier.*—EDMUND N. LACROIX, Minneapolis, Minn. Application filed May 28, 1873.

Reciprocating air-tube or tubes connected by flexible tubes with a blow-fan, so arranged under a screen or screens as to concentrate a narrow blast of air, which keeps the meshes clean and stirs up the material on top of the screens.

Claim.—1. The combination of the traveling air-tube or tubes E E with the separator or separators B B, said air-tubes being arranged so as to concentrate the blast and force it through the meshes in a thin line, as herein shown and described, and for the purpose specified.

2. The construction of the air-tube E, with the enlarged body a, contracted top b, and narrow slit or opening c extending longitudinally of the tube, as and for the purpose specified.

3. In combination with the traveling air-tube or tubes E E, the pipe or pipes L L, and a blower, fan, or other device for forcing air through the pipes, as herein shown and described, and for the purpose specified.

4. The combination, with the screws G G and with the clutch-coupling, of the rod P provided with stops s s, the elbow N, and lever M provided with the slots k p, the whole arranged and operating as herein described.

139,586.—*Corn-Husker.*—CHARLES A. LANG, Palmyra, Me. Application filed February 15, 1873.

Ears of corn being placed in ear-holder the shaft is revolved, carrying the knives up; the knives are opened outwardly until end of ear is reached, when knives are automatically closed, cutting off the butt of the ear and releasing it from the husk.

Claim.—1. The double-bladed knives C C, arranged and operating substantially as shown and described.

2. The semicircular bars J J, in combination with the arms B B carrying the knives C C, substantially as shown and described, and for the purpose specified.

3. The bars l l for compressing the rear ends of the pivoted bars B B, and separating the knives C C, substantially as shown and described.

4. The loop L for releasing the ear from the knives, arranged substantially as shown and described.

5. The stripping-knife k, on the board K, arranged substantially as shown and described, and for the purpose specified.

139,587.—*Sleeping-Car.*—JAMES T. LEIGHTON and DOMINICUS R. LEIGHTON, New Haven, Conn. Application filed December 13, 1871.

The couches are of canvas, and adapted to be rolled up and stowed out of the way without removing them from the sections, and so to be concealed, and not interfere with the seats for day travel.

Claim.—1. In sleeping-car couch, the angle-rail F F', in combination with the canvas bottom H, the holding and tightening rod c, and hooks d, substantially as and for the purpose described.

2. The angle-rail F having lip projections e e for interlocking with the posts L, to effect an easy and secure connection in forming the couch without fastenings, as described.

3. The angle-rail F, constructed to receive and hold the rolled canvas bottom H, and to form a seat, F', for sustaining it in the side recess I of the car, as described.

4. The detachable hinged partition P R S, in combination with the upper buttress having receiving-groove i, and the supporting and holding seat-back T, as and for the purpose described.

5. The roller N for the canvas bottom N', located and arranged within an opening, n, in the seat-back T, and between two adjacent seat-backs, for the inclosure of the roll N and canvas when rolled, as described.

139,588.—*Running-Gear of Wagons.*—ANDREW LEWIS, Minneapolis, Minn. Application filed December 17, 1872.

Midway between the front and rear axles the reach is divided, and its ends connected by means of fifth-wheels.

Claim.—1. The combination of wheels D and D', with the parts C and C' of a reach or perch of a wagon, constructed to operate substantially in the manner and for the purpose described.

2. The combination of the parts C and C', wheels D and D', with the link e, substantially as and for the purpose described.

139,589.—*Railroad Switch.*—JOHN F. LINTHICUM, Vallejo, Cal., assignor of one-fourth his right to IRA GILCHRIST, same place. Application filed December 12, 1872.

The switch is operated from the train through levers and connecting-rods acting on a triangular crank-lever plate, which when moved shifts the switch-bar, and also brings a chock into line to hold the rails rigidly in position.

Claim.—The attachment plate, in connection with the chock and bar, for moving the switch-rails and holding them in position.

139,590.—*Sad, Fluting, and Band Irons.*—AUSTIN S. MANN, Pittsburg, Pa. Application filed December 2, 1872.

A sad-iron with one smoothing and one corrugated face. The handle is pivoted by a rod running through the body of the iron, and held in different positions by a set-screw. The corrugated face of the fluter is covered with a corrugated sheet of metal, and the grooves are of variable depth from end to end.

Claim.—1. A combined smoothing and fluting iron, composed of the separately-cast thin corrugated plate a^{10} and main body A, united together by casting them on each other, substantially as and for the purpose specified.

2. A reversible sad and fluting iron hinged to the handle and secured rigidly thereto by a set-screw, a^9, the point of the iron entering a groove, a^7, in the handle, and the set-screw entering a groove, a^8, in the heel of the iron, substantially as specified.

3. A fluting-iron having grooves of variable depth form end to end, substantially as specified.

4. A sad-iron composed of the perforated plate A and a handle, which, being cast or formed in a single piece with inwardly-projecting studs a^4 and a^5 on its arms, is "sprung" on the plate, substantially as specified.

5. The perforated plate A of a sad-iron and its handle formed and sprung on the plate, as described, in combination with the rod a^3, substantially as specified.

139,591.—*Ladies' Work-Stand.*—GILBERT S. MANNING, Danville, Ill. Application filed April 26, 1873.

A stand composed of legs and boxes or trays, and an inclosed revolving top with a cover in two parts opening and closing on pivots at one end, which secure a base-plate upon the covers, whereon is a revolving inclosed spool-stand.

Claim.—1. A stand for a table, composed of legs and trays or boxes M N, substantially as specified.

2. The revolving inclosed box-top with cover C, pivots E, base F, and revolving spool-stand G, constructed and arranged substantially as specified.

139,592.—*Paper-File.*—CHARLES MASON, New York, N. Y. Application filed April 12, 1873.

A device bent of suitable wire in such a manner that the top part holds, in connection with the spring action of the bottom and side parts, the papers placed on file between them.

Claim.—The paper-filer, formed of the two right-angled end portions d e f, and connecting portion a b, the said parts forming spring-jaws, as shown and described.

139,593.—*Telegraph-Pole.*—THOMAS JENNINGS MCCARVER, JAMES ATHEY, and BENJAMAN JENNINGS, Oregon city, Oreg. Application filed May 18, 1872.

A telegraph-pole made of tapering angle-iron, joined at cross-sections by collars, into which the upper and lower parts are socketed.

Claim.—A telegraph-pole made of metallic sections, constructed substantially as described.

139,594.—*Machine for Cutting Hoop-Locks.*—JOHN MCGREW, Ravenswood, W. Va. Application filed February 19, 1873.

A reciprocating frame carries a series of cutters for forming the lock in the hoop, which rests during the operation upon a sliding bed, moved by inclines upon the reciprocating frame so as to be always in advance of the cutters.

Claim.—1. The series of vertically-reciprocating knives E, combined with an intermittently and horizontally moving gage, F, as and for the purpose set forth.

2. The arrangement of the inclines on reciprocating knife-holder, so as to operate the sliding gage in the manner described.

139,595.—*Process for Preserving Corn.*—LOUIS MCMURRAY, Baltimore, Md. Application filed May 20, 1873.

Claim.—1. The process of preserving corn by first mixing it with the prepared juice, then heating or cooking the same, and then putting it into cans and subjecting it to final heating at the temperatures stated, substantially as described.

2. The use of the flavored liquid obtained from the cob in preserving corn, substantially as set forth.

139,596.—*Harvester.*—WILLIAM K. MILLER, Canton, Ohio. Application filed March 14, 1873.

A guard-point is arranged in front of the friction-roller, on the rake-arm, to open the switch and prevent the roller from catching on the switch.

Claim.—1. The guard-point 1 on the rake-arm above and in front of the friction-roller to insure the opening of the switch, and to prevent the roller from catching on the end of the switch, as described.

2. The combination of the rake-arm, its plate V', and the arm v', provided with means for adjusting the rake-arm vertically.

139,597.—*Harvester.*—WILLIAM K. MILLER, Canton, Ohio. Application filed March 14, 1873.

A hinge joint machine.

Claim.—The adjustable locking stop-bar K, mounted on the shoe and resting on the coupling-frame, as set forth.

139,598.—*Manufacture of Leather-Board.*—STEPHEN MOORE, Sudbury, Mass., assignor to himself and HOMER ROGERS, same place. Application filed March 5, 1873.

Forms the board of two kinds of stock—a filling of cheap material and a skin or covering of superior. The superior stock is taken upon the felt and wound upon the cylinder until a sufficient number of layers is obtained; then takes the filling from a second vat, conducts it to and winds it upon the cylinder over the layers of superior stock. The felt is then disconnected from the filling-vat, and again connected to the first vat containing the superior stock for the opposite surface.

Claim.—The improvement in the manufacture of leather-board, consisting in forming the board with a filling surfaced by the layers upon the cylinder, substantially as described.

139,599.—*Electrical Gas-Lighting.*—CHARLES G. MUELLER and HEINRICH MEIER, Hanover, Germany; said MEIER assignor to said MUELLER. Application filed December 5, 1872.

The gas-burner, attached to a glass bell which is immersed in the fluid of a galvanic battery, rests upon a mercury-valve which thus cuts off its connection with the gas-tube opening under the bell. When the gas is turned on through the tube its pressure within the bell depresses the surface of the liquid therein, and, correspondingly raising the surface of the liquid outside the bell, brings it in contact with the suspended annular zinc element thus exciting a current which heats a platinum wire above the burner. The glass bell, being at the same time elevated by the pressure, raises the gas-burner, and, thus opening the mercury-valve, allows the gas to escape and become ignited.

Claim.—1. In an automatic gas lighting and extinguishing apparatus, the gas burner tube H, arranged to have a direct vertical adjustment between guides M N by the action of the diving-bell D on its lower end, and which forms an integral part therewith to open and close, through said adjustment of the burner-tube, the valve Q, which it also carries, substantially as and for the purpose described.

2. In combination with the bell D, the guides U and pins T, arranged and operating essentially as herein described.

3. The combination of the bell D with the gas-valve Q, both arranged to operate essentially as herein described.

139,600.—*Food from Wheat and Process of Preparing the Same.*—ERASTUS H. MURRAY, St. Paul, Minn. Application filed November 13, 1872.

Cracks and bolts as usual; then cleans, polishes, and grades.

Claim.—1. As a new article of manufacture, cracked wheat, possessing the uniform granular character, substantially as set forth.
